The case of Portugal is pertinent for this study, since its visibility has increased tremendously, receiving every year about 21 million visitors (visit Portugal, 2017). Portugal's tourism boom resulted in having been recognized in the previous year of 2018 as the best tourist destination in the world for the second consecutive year by the *World Travel Awards* (World Travel Awards, 2018). Portugal provides some of the best circumstances for the organization of music festivals, starting with the climate, which is characterized by being mainly warmer, and also with the diversity of landscapes. In this vein, with the intention to go further in understanding drivers of engagement of music festival

tourists, the current study to analyze how tourist engagement with music festivals and their psychological well-being is achieved through emotional states and surprise consumption. The research question is: how emotional states and surprise consumption act as drivers of tourist engagement and psychological well-being at music festivals?

The remainder of this paper presents the theoretical background, method, and data analysis. The last part is devoted to conclusions and implications.

## THEORETICAL FRAMEWORK

### *Tourists' emotional states*

Emotions can be defined as a *"complex phenomena characterized by a combination of cognitive and experiential factors, psychological states, and behavioural expressions."* (Rodríguez-campo et al., 2019, p.2).

Due to its complexity, emotions can be considered either an antecedent or an outcome of the customer experience (Palmer, 2012). As noted by Brakus et al. (2009) emotions can be seen as a consequence that occur in the inner self after consumption experiences induced by stimuli, while constitutes a relevant determining factor of satisfaction and purchase decisions (Brunner-Sperdin, Peters, and Strobl, 2012; Barsky and Nash, 2002). Moreover, by being an outcome of an experience, its study helps organizations to realize how they should customize experiences (Knobloch et al., 2017; Rodríguez-campo et al., 2019).

Lee, Lee, Lee, and Babin (2008) posit that emotions can be treated as outcomes of environmental perceptions. More recently, there has been raised interest in emotional states, particularly on consumer delight (Finn, 2005; Loureiro, Miranda, and Breazeale, 2014). In order to measure delight, some researchers have used the same scales that are used to measure emotions (Loureiro et al., 2014; MiRan, Vogt, and Knutson, 2015). These studies have stated that arousal and positive affect are antecedents of customer delight. Finn (2005) present a 13 emotions measures which were based on the original measurement developed by Oliver (1997). The emotions' measures are split between four factors such as delight, arousal, positive affect and surprising consumption. The surprising consumption is generally viewed as an emotion which represents the result of the difference between the actual performance and expectations (Oliver, 1997; Finn, 2005). Both arousal and positive affect are the fundamental antecedents of customer delight (Oliver, 1997). Arousal refers to the extent to which people feel excited and active (Loureiro et al., 2014). While positive affect is conceptualized as the set of feeling of pleasure and happiness (Finn, 2005). Lastly, delight can be regarded as an emotional response that englobes surprise, arousal, and positive affect (Finn, 2005; Loureiro et al., 2014; Oliver, 1997). As a matter of fact, the concepts of satisfaction and delight are quite similar, but they are discussed as different constructs (Finn, 2005). In this vein, the following hypotheses arise:

H1: music festival tourist delight is a function of surprise consumption, arousal and positive affect

H2: positive affect is positively associated with satisfaction

*Tourist engagement and psychological well-being*

The literature on consumer engagement has emerged from the Service-Dominance (S-D) logic (Hollebeek, 2014). The Vargo and Lusch's (2004) study makes an original contribution, considering the shift in marketing over the last decades, where they stress out the importance of the exchange of intangible goods towards the tangible ones. An example of intangible goods can be knowledge, procedures, and specialized skills, and the new S-D logic developed by these authors can in this way lead to more ample perspective by combining goods with services (Vargo and Lusch, 2004). The service-dominance view seeks to establish focus on relationships and on the value of co-creative experiences (Brodie et al., 2011; Hollebeek, 2014; Vargo and Lusch, 2004; Rosado-Pinto and Loureiro, 2020). Customer engagement can be defined as the result of the interaction between a customer and a firm (Kumar et al. 2010; Brodie et al. 2011). Hollebeek, Glynn, and Brodie (2014, p. 154), propose a definition for consumer-brand engagement as the *"consumer's positively valenced brand-related cognitive, emotional and behavioural activity during or related to focal consumer/brand interactions"*. While, Pansari and Kumar (2017, p. 295) draw our attention for the customers' activities which give rise to CE and define it *"as the mechanics of a customer's value addition to the firm, either through direct or/and indirect contribution"*.

Kumar et al. (2010) find that exist diverse forms for a consumer affect a firm performance, which consequently generates customer engagement, which is composed by four indicators that can contribute to level of customer engagement between customers and brands/companies (customer purchases, customer referrals, customer influence and customer knowledge). Direct contributions encompass the customer purchases, so when customers buy to a company any product/service they are generating profit (Kumar and Pansari, 2016). Whereas, the indirect contributions are constituted by customer referrals, customer influence and customer knowledge (Pansari and Kumar, 2017). Customer referrals occurs when a customer can attract others that would not be through the direct channels of marketing. Customer influence is achieved through the social media channels that allow people to exchange information about the brand or products in a real-time way. Finally, customer knowledge is linked to the creation of value which can be generated when a customer gives feedback about a product or service to a company/brand.

According to Pansari and Kumar (2017), the process of engagement has to be created on the basis of satisfaction and emotion, which they claim to be the antecedents. In addition, these authors claim that satisfaction is usually linked to the direct contributions whereas emotions is linked to the indirect contributions. Lemon and Verhoef (2016) claim for the evidence of a link between customer experience

and customer engagement. They enlighten that nowadays customer engagement can be more witnessed particularly because the current touch points of the customer's journey experience are very interactive, which allow to obtain customer's social and emotional reactions.

Packer and Ballantyne (2011) claim that engagement in music festivals context can provide union between the festival attendees because they are in the same space and for a similar purpose, which results in a bigger sense of community. As noted by Snell (2005), music festivals are normally held for successive days which offers to the participants a great opportunity for them to feel completely absorbed by the experience. For instance, music festivals that have camping access will naturally concede even higher chances to occur engagement between visitors, as it is formed a sense of community. The consumer engagement can occur in two ways, physically and digitally (Laurell and Björner, 2018), and the manifestation of digital festival engagement has happened mainly in social media. Kumar and Pansari (2017) argue that the customer influence, one form of indirect contribution for engagement, is normally linked with the informative content posted in the social media platforms. Laurell and Björner (2018) point out that ultimately visitors have become more and more through the digital way. In sum, emotional states related to the festival may influence the way customers are engaged with the festival. Therefore, we suggest the following hypothesis:

H3: tourist engagement is a function of music festival tourist delight, positive affect and satisfaction

Music festival should also be connected to psychological well-being. The discussion around

The concept of well-being emerged out of the curiosity to better understand the meaning of happiness and human life satisfaction in the field of sociology, but over time its study has been extended to others areas such as sciences and economy (Smith and Diekmann, 2017; Shahrabani et al. 2019). Indeed, subjective well-being (SWB) has received considerable attention to determine the link between the people's possession of goods that grant them a better life, that is material wealth, with their reported levels of happiness. We may claim that there are two domains characterizing SWB. The cognitive component encompasses the perception of one's life overall satisfaction as well as another life's accomplishments, such as personal relationships and professional life. Regarding the affective domain, it comprises positive and negative moods at the exact moment of the experience (Jalloh, Flack, and Chen, 2014). The affective is considered positive when individuals experience emotions such as joy, elation and affection, and negative when they experience emotions such as guilt, anger, and shame (Parsons, Mackenzie, Filep, and Brymer, 2019).

The cognitive and affective domains were, in turn, related to another two perspectives of well-being (Parsons et al., 2019), seen as antagonistic and designated by Hedonia and Eudaimonia. The Hedonic philosophy is mostly connected with the sensation of pleasure (Huta, 2013) and inhibition of pain (Huta, 2013). Hedonia perspective is concerned to the positive feelings which can arise from the

individuals' engagement at the moment they are performing an activity. However, eudaimonia is more related to the outcomes that can be accomplished with an activity, even if those outcomes emerge later than the end of the activities (Yolal et al., 2016). Following this line of reasoning, eudaimonic perspective consider as the most relevant aspects the personal development and the reach of the human's potential (Smith and Diekmann, 2017). Psychological well-being is embedded in this last perspective and may be regarded as such as autonomy, environmental mastery, personal growth, positive relations with others, purpose in life and self-acceptance (Ballantyne, Ballantyne, and Packer, 2014). Taken this line of thoughts, a tourist engaged with the music festival will be more likely to reach psychological well-being than a tourist not engaged. Thus, we suggest that:

H4: tourist engagement is positively associated with psychological well-being

## **METHOD**

The online questionnaire was spread through online communities of people who regularly visit music festivals. The questionnaire was open for not much longer than two months (27<sup>th</sup> of December to 1<sup>th</sup> of February). The questionnaire was based on the literature review and all measurement items were adapted from existing instruments. Thus, all items were measured using a 6-point Likert-type scale. Emotions and surprise consumption were measured based on Finn (2005), customers engagement adapted from Kumar and Pansari (2016) (dimensions of influence and knowledge) and psychological well-being (Ballantyne, Ballantyne, and Packer, 2014). A total of 394 fully completed and usable questionnaires (after excluding those with missing values, inconsistent responses or extreme multivariate outliers) were collected from the 400 distributed. Of the participants, 53% are female and 47% are male. Most of the sample belongs to the 18-24 age range (59%), followed by the 25-34 age range (21%).

## **RESULTS**

The PLS approach was employed to test the model. The reason lies in the fact that the model has second order formative constructs (the repeated indicators method) and we do not have a large sample size (Hair et al., 2017). The PLS model is analyzed and interpreted in two stages. First, the adequacy of the measurements is assessed by evaluating the reliability of the individual measures and the discriminant validity of the constructs (Hair et al., 2017). Then, the structural model is appraised. All items have item loading values above 0.7 and all constructs are reliable since the composite reliability values exceed the 0.7 threshold and even the strictest one of 0.8 (Hair et al., 2017). The measures demonstrated convergent validity as the average variance of manifest variables extracted by constructs (AVE) was at least 0.5. Discriminant validity was examined via the Heterotrait-Monotrait

ratio of correlations, with all results taking values below 0.90 and therefore we can claim that the discriminant validity of the constructs has been established.

Table 1. Measurement Results.

|                          | Cronbach's Alpha | rho_A | Composite Reliability | Average Variance Extracted (AVE) |
|--------------------------|------------------|-------|-----------------------|----------------------------------|
| Arousal                  | 0.853            | 0.863 | 0.910                 | 0.772                            |
| Delight                  | 0.728            | 0.736 | 0.846                 | 0.647                            |
| Engagement               | 0.892            | 0.899 | 0.913                 | 0.602                            |
| positive affect          | 0.843            | 0.846 | 0.905                 | 0.761                            |
| psychological well-being | 0.953            | 0.954 | 0.964                 | 0.843                            |
| Satisfaction             | 0.912            | 0.912 | 0.958                 | 0.919                            |
| Surprising consumption   | 0.758            | 0.762 | 0.892                 | 0.805                            |

The structural results are presented in Table 2. All path coefficients were found to be significant at the 0.001 or 0.05 levels, except the causal delight → tourist engagement. The  $Q^2$  is positive, so the relations in the model have predictive relevance. The model also demonstrated a good level of predictive power ( $R^2$ ). In fact, the median level of predictive power ( $R^2$ ) reveals a good overall fit of the structural model (see Table 2).

Table 2. Structural results.

| Path  | Beta  | Standard Deviation (STDEV) | T Statistics ( O/STDEV ) | P Values |
|---|-------|----------------------------|--------------------------|----------|
| arousal → delight                             | 0.192 | 0.063                      | 3.031                    | 0.003    |
| arousal → positive affect                     | 0.708 | 0.044                      | 15.961                   | 0.000    |
| delight → tourist engagement                  | 0.113 | 0.081                      | 1.393                    | 0.164    |
| tourist engagement → psychological well-being | 0.639 | 0.032                      | 19.796                   | 0.000    |
| positive affect → delight                     | 0.520 | 0.062                      | 8.373                    | 0.000    |
| positive affect → tourist engagement          | 0.187 | 0.079                      | 2.373                    | 0.018    |
| positive affect → satisfaction                | 0.537 | 0.057                      | 9.485                    | 0.000    |
| satisfaction → tourist engagement             | 0.134 | 0.064                      | 2.077                    | 0.038    |
| surprising → arousal                          | 0.477 | 0.060                      | 8.001                    | 0.000    |
| surprising → delight                          | 0.188 | 0.046                      | 4.068                    | 0.000    |
|   | $R^2$ |                            | $R^2$                    |          |
| Arousal                                       | 0.228 | positive affect            | 0.502                    |          |
| Delight                                       | 0.616 | psychological well-being   | 0.408                    |          |
| tourist engagement                            | 0.137 | satisfaction               | 0.288                    |          |

## CONCLUSION AND IMPLICATIONS

From the results there is evidence that surprising consumption proved to be a very important driver of engagement, particularly through arousal, positive affect. However, the delight is not significantly associated to tourist engagement, but this last contribute to psychological well-being. Some researchers (e.g., Shane and Patterson. 2010; Packer and Ballantyne. 2011; Packer and Ballantyne, 2014) have recognized the importance of exploring the drivers of tourist engagement in the context of music festivals, but up until now there is still a gap in the literature. This research has contributed for the field of tourism by giving new insight for the gap.

Regarding managerial implication. Firstly, this study has revealed that festival organizers should invest in providing a good atmosphere, an attractive program and enough facilities to the festival attendees. Secondly, in this study we find that music festivals that induce tourist' feelings of surprise leads to better chances of engagement. This can be explained by the fact that music festivals offer an experience different from the usual consumption experiences by its experiential nature. Consequently, festival managers should concentrate on how to surprise their visitors, for instance, by offering a festival program with the best bands and by offering a unique atmosphere.

All studies face limitations, and this is not an exception, but as it matters to understand how the restraints were managed during this study and because it is important to realize how they should be interpreted. Firstly, one of the limitations is the fact of the sample is not completely balanced within the age groups, as the representation of the sample is mostly characterized for younger people. Yet, it is also important to understand that most tourists of music festival tend to be young people.

Secondly, as the research method was quantitative, there might be some disadvantages, such as the usage of closed questions and the high probability of participants' misapprehension relatively to the items included in the measurement scales, which can lead to more untrue responses. When conducting interviews instead of surveys, it is possible to clarify the participants about what they did not comprehend. Moreover, through questionnaires is difficult to obtain in-depth information and consider the different perspectives the participants may have regarding the topic which are not included in the scale items.

Lastly, the inclusion of the loyalty variable in this model could be an important issue for further research.

## TRAVEL LAW AND SHARING ECONOMY

**Maniatis, Antonios**

Department of Business Administration of Agricultural Products and Foods, University of Patras (UPATRAS), Agrinio, Greece

### ABSTRACT

Travel Law constitutes a specific, self-existent field of law, partly coinciding with Tourism Law whilst the concept of “industry” related to travels and hotel business is in decline, at least in constitutional terms. This branch of law refers to rights and obligations of the persons involved in various types of trips. One of its most significant sources consists in EU Regulation 261/2004, particularly promoted by the jurisprudence of the EU Court of Justice in case of flights delayed more than three hours (“Sturgeon case”). However, in the comparable “Aegean case”, relevant to the cancellation of a flight due to the insolvency of the tour operator, the airline involved was the winner. Besides, States and legislators have to cope with new rights and professional roles, such as the rights to be a tour guide, particularly in the competitive case of free tours, and to enact the role of quasi hotelier, through digital platforms, like GuruWalk and Airbnb respectively. Travel Law is produced more and more by private individuals to enhance their income as well as by ambitious start-up companies in the framework of sharing economy. Last but not least, there has been the phenomenon of reversing the role of the official tourist guide, compared to persons, such as the tourist and the informal guide, and to things, exemplified by travel guides (books). This phenomenon happens on international scale whilst another reversal has already been produced, at a national level. In Greek, the tourist is called either “tourist” or “periigitis”, a word that means a person who visits destinations for leisure purposes and in ancient Greek was used to denote the guide against “teoros” (tourist) and, in a limited way, the authors writing down their knowledge which was acquired through their travels.

*Keywords: Aegean case; Air passengers' rights; Free Tours; Hospitality / "Turismofilia", Right to be a Guide; Tourist / "Periigitis"; Travel Law; Travel Industry / Tourism Industry; Sharing economy / Collaborative economy; Sturgeon case*

### INTRODUCTION: FROM FICTION TO NORMATIVITY

Travels have been an important activity of human beings on a diachronic basis. However, they have constituted something particularly crucial in the current century, which from scratch has been marked

by speed. This remark is valid not only for trips but also for other activities, such as telecommunications. Anyway, electronic communications and trips by means of planes and helicopters have a normativity in common, which is called "Air Law" or (in Greek) "Air Space Law". In other words, Air Law includes Civil Aviation Law as well as Telecommunications Law, although the mainstreaming use of this term refers only to rules on air transport.

A French lawyer of the nineteenth century, Jules Verne, is best known for his fictional travel narratives whilst nowadays a lot of the travel inspirations of the Father of Science Fiction have been transformed into reality and law has been specialized in trips. As already implied, the importance of journeys, let alone with dynamic means of transport like the air ones, has led to the emergence of a new field of law. Travel Law is a specific branch, in spite of its general character, compared to Air Law. The current paper consists in an investigation on the profile and content of this normativity. The research on the matter focuses on the following hypothesis:

*We suppose that Travel Law is a consumer-based branch, due to sharing economy.*

This hypothesis constitutes the central investigative suspicion of a wider research project on Travel Law, with emphasis on consumers' rights.

As far as the structure of this paper is concerned, there are three subdivisions in its main part.

The first part has a general profile, compared to the rest ones, as it serves as an introduction in the profile of Travel Law.

First of all, it highlights the existence and the characteristics of this branch, with a special reference to the conceptual question of "travel industry".

It also analyzes the relation between this field of law and Tourism Law.

The second part, like the third one, deals with the content of normativity on journeys, examining passengers' rights.

At first, it takes an approach to the question of existence of a general right to transport.

In addition, it focuses on the Bill of Rights of air passengers in the EU legal order, which consists in Regulation (EC) No 261/2004.

Besides, it refers to another text of the same context, Regulation (EC) No 1107/2006, which goes further with air travelers' rights.

Last but not least, it deals with passengers' guarantees in virtue of Directive (EU) 2015/2302 on the specific phenomenon of package travel.

In the framework of the third part, which correlates the main scope of the paper with sharing economy, there is an overview of the tourism sector, fitting in well with this economic model.

Afterwards, there is an analysis of sharing economy on tourist information, particularly as for the new trend of free tours.

After the completion of the third part, some critical final remarks follow, mainly in correlation to the paper hypothesis.

## **AN INTRODUCTION TO THE PROFILE OF TRAVEL LAW**

*The profile of Travel Law with emphasis on "travel industry"*

Travel Law is a self-existent field of law, focusing particularly on the set of rights and obligations of the contracting parties in the transport sector. It covers a great variety of aspects and institutions of travelling process, such as travel agencies, tour operations, timeshare, the regulation and licensing of travel industry.

It is notable that "travel industry" is a controversial term, which is rather frequent but inaccurate. Indeed, there is no industry (manufacture) on the matter but delivery of services, consisting mainly in transport or accommodation. However, this term is endowed with a great tradition, as it emerged in the century of the Father of Science Fiction. More precisely, in 1884 Josef Stradner published a study, in which there was a first definition of tourism. His approach to this phenomenon conceived it as "the industry of travels". If tourism was connected by the doctrine with the travel subsector of economy very soon, six decades later travel industry was transformed from a theory into constitutional norm, for the first time. The initial version of article 117 of the 1947 Constitution of Italian Republic consecrated "tourism and hotel industry" as a field of competence of Regions against the State. The irony of history is that the so-called "hotel industry" was not an authentic form of industry but constituted the unique case of "industry" which was explicitly recognized in the Constitution. Anyway, through the 2001 amendment, the reference to the set "tourism and hotel industry" was deleted. To date, no political volunteer to make a reference to hotel industry (or travel industry) has emerged, as noticed in the framework of the 2016 amendment process. In the meanwhile, the guarantee of tourism has been explicitly incorporated into very few Spanish-language Constitutions (Spain, Colombia and mainly Venezuela) but no reference to "industry" has been made on the matter. So, there is a decline in the concept of industry without being replaced by the human right to hospitality whilst hospitality has a marginal position in the entire legal system, namely not only with reference to tourism.

Anyway, hospitality is not just an organic or legal concept but in general whether the conditions in a society are hospitable to receive visitors. For instance, according to a research among tourists from Greece and Portugal, the experience of economic crisis and the salience of economic and political hardships mitigated their intentions to travel to destinations with similar problems. These factors had no effect on Israelis, who have not experienced such problems in their country. Frequent terrorist incidents diminished the intentions of Greek tourists to travel to destinations marked by terrorism,

such as Israel. In conclusion, different factors affect tourists' travel-related decisions in each of these three countries (Shahrabani et al., 2020).

Besides, Travel Law has got various subdisciplines being relevant to ad hoc legal regimes. For instance, it comprises Cruise Law as well as Air Law, which has gained a very extended international academic interest.

Nevertheless, Law on Civil Aviation has been investigated in a limited way by the Greek doctrine, to date. This subject, which is taught on an ordinary basis in some tertiary schools, is supported not only by superior education foundations but also by journals, such as the official review of Military Aviation, called "Aeroporiki Epitheorisi", which has been awarded by the Academy of Athens (Maniatis, 2014).

Another discipline of Travel Law consists in Hotel Law, exemplified by the timeshare directive 2008/122/EC, which replaced the timeshare directive of 1994. The aim of the new normativity is to create a simplified and coherent framework for the regulation of timeshare and long-term holiday products, as well as exchange and resale.

#### *A Conceptual Approach to Travel Law compared to Tourism Law*

The term "Travel Law" is not as common as the term "Tourism Law", which is considered as the mainstreaming one as for normativity on passengers. In spite of the similitude of these expressions, it is not about synonyms, given that Tourism Law refers to regulations on the entire phenomenon of tourism sector, including entrepreneurship. It comprises normativity on travels, but it also regulates hotels and other enterprises of this sector. In other words, Travel Law in its narrow sense consists in regulations on the travelling process whilst in a wider sense is also associated to other aspects of traveller's consumption, such as accommodation, information by a guide etc.

However, the relevance between tourism and travel is intrinsically high, already in etymological terms. The word "travel" is mainly destined to declare a leisure activity whilst the comparable word "journey" is oriented above all to a trip for business reasons. As far as the word "trip" is concerned, it has an intermediary function, being available to declare either leisure or professional movements. In a similar way, Travel Law and Transport Law are not fully synonym terms, given that Transport Law is oriented to the entire phenomenon of transports, including transports of goods. In this conceptual framework, Travel Law could be held as a branch of intermediary position, between the general branch of Transport Law and the specific field of Tourism Law.

The normativity on tourism regulates basically accommodation and transport for tourists but also the rest categories of services available for this category of consumers, such as guidance etc. However, it is notable that tourism has a heterogeneous nature, given that its services principally are not destined uniquely to tourists but also to other consumers, exemplified mainly by visitors. It results that

Tourism Law and Travel Law constitute near synonym terms whilst there is an overdose of the first one against the second one. This tendency is present even in academic programs, given that the discipline of Travel Law is rarely taught, as a separate course.

Tourism Law is a self-existent field of law but has not evolved into autonomous branch, in contrast to a few traditional branches, such as Civil Law, Commercial Law, Public Law and Criminal Law. The autonomy of a field means full independence, particularly as for practical matters, such as interpretation. An autonomous branch is self-sufficient in case of legal interpretation, namely it makes use of its own conceptual schemes and theories. In a similar way, Travel Law is not autonomous, let alone the fact that it has a more limited tradition in terms of elaboration and teaching, compared to Tourism Law, as already signalized.

Tourism Law is promoted particularly through its osmosis with the phenomenon of air transports (Maniatis, 2016). For instance, the technological development has led to a significant contestation of the concept of tourism. This is true particularly in the matter of the time parameter of travels, which has been used by World Tourism Organization. Given that the space of 24 hours implicates an overnight stay, it has been regarded as the necessary time to characterize a trip as a tourist's movement. Nevertheless, it is signalized that this approach is due to merely statistical reasons. Nowadays, the duration of the stay at the tourism destination does not affect the character of this movement because the means of transport (plane, highspeed train etc.) as well as the construction of tunnels, bridges and underwater tunnels (e.g. the Channel Tunnel, the Oresund Bridge) enable the tourist to leave his residence, visit a tourism destination in another country and return to his residence in a period not superior to 24 hours (Mylonopoulos, 2011). It is also to point out that this remark comes from the legal doctrine and so highlights the need for jurists' academic support in the research on tourism, which deserves being transdisciplinary rather than multidisciplinary. Besides, it is notable that there are various approaches to the question of the existence or emergence of the so-called "science of tourism".

## **PASSENGERS' RIGHTS**

### *Is There a Right to Transport?*

Not only does Travel Law exist as a self-existent discipline but proves to be successful in practice. It is endowed with a separate guarantee in favour of private individuals, the right to transport. The French Transports Code explicitly recognizes this guarantee, as follows, in article L1111-2:

*" The progressive implementation of the right to mobility allows the user to travel under reasonable conditions of access, quality, price and cost for the community, mainly by the use of a means of transport open to the public".*

However, the legal achievement consisting in the recognition of the universal right to mobility is not exempted from criticism (Le Monde, 2018). In 2018 in France one in two people in integration had already refused a job or a training project due to transport reasons. The average annual budget of French people for mobility, consisting in 5.000 euros, was increasing. It placed a part of the populations, in particular those dependent on private cars, in a vulnerable situation. The right to mobility above all should be guaranteed through a relevant network of the territory with "mobility platforms", as it already happened in some cities and places in France and elsewhere.

Besides, in the People's Republic of China, with reference to the legal framework on consumers' protection, some air transporters try to take revenge against some customers exercising their rights by placing those activists in a blacklist (Bounelas, 2016). The involved companies have adopted this practice with a double objective. On the one hand, they punish the disobedient passengers with the pretext of their aggressive conduct. On the other hand, they set an example for others, who would hesitate to claim their rights. It is also notable that in China a law professor was punished because he made a course on the phenomenon of Constitutionalism. More precisely, in 2013 Doctor Zhang Zuezhong was fired for teaching constitutionalism, which is intrinsically associated to the recognition and protection of human rights. Through this notion, he emphasized the interest of having a Constitution as a basis and limitation of power (Peters, 2018).

*Air Passengers' Rights in virtue of Regulation (EC) No 261/2004: the Pendulum Between the Case-law "Sturgeon" and the Case-law "Aegean"*

Regulation (EC) No 261/2004 of the European Parliament and of the Council of 11 February 2004, establishing common rules on compensation and assistance to passengers in the event of denied boarding and of cancellation or long delay of flights, and repealing Regulation (EEC) No 295/91, constitutes the current normativity in the matter of indemnification for air passengers in the EU legal order, in spite of the fact there was an attempt to modify it.

This legislative act foresees inter alia the passengers' rights in case that a flight is in delay. According to article 6, when an operating air carrier reasonably expects a flight to be delayed beyond its scheduled time of departure:

- (a) for two hours or more in the case of flights of 1500 kilometers or less; or
  - (b) for three hours or more in the case of all intra-Community flights of more than 1500 kilometers and of all other flights between 1500 and 3500 kilometers; or
  - (c) for four hours or more in the case of all flights not falling under (a) or (b),
- passengers shall be offered by the operating air carrier:

(i) the assistance specified in Article 9(1)(a) and 9(2). This aspect of the right to care consists in free of charge meals and refreshments in a reasonable relation to the waiting time and free of charge two telephone calls, telex or fax messages, or e-mails.

(ii) when the reasonably expected time of departure is at least the day after the time of departure previously announced, the assistance specified in Article 9(1)(b), namely free of charge hotel accommodation, and in Article 9(1)(c), having to do with free of charge transport between the airport and place of accommodation (hotel or other).

(iii) when the delay is at least five hours, the assistance specified in Article 8(1)(a), consisting in reimbursement within 7 days of the full cost of the ticket at the price at which it was bought, for the part or parts of the journey not made, and for the part or parts already made if the flight is no longer serving any purpose in relation to the passenger's original travel plan, together with, when relevant, a return flight to the first point of departure, at the earliest opportunity.

To sum up, this Bill of rights includes the following guarantees:

1. The right to care,
2. the set of rights to reimbursement and to return to the first point of departure.

These provisions are subject to criticism, both from a technical and a material point of view. On the one hand, the formulation to cite the rights awarded to passengers is not explicit but based on the reference to other articles, specialized per passenger's right. In this way, the interested persons are bothered because there is not a concentrated and fully clear description of their rights, as for the concrete problem they face. According to the doctrine "Form Follows Function", consumers, particularly those deprived of any legal knowledge, should be facilitated in being informed their rights. On the other hand, the text previews no right to compensation whilst it does not omit to foresee compensation of up to 600 euros to passengers who suffer cancelled flights, overbooking or denied boarding. However, the doctrine has remarked that this Regulation has of course become infamous for the escalation of claims being brought for compensation for delayed flights (250 euros, 400 euros or 600 euros) (Parkinson, 2019).

In a similar way, the Court of Justice of the European Union has highlighted the obligation of an air transporter to compensate passengers for a delay. In its *Sturgeon* sentence, of 19<sup>th</sup> November 2009, for the first time it recognized a right to compensation in case of a delay lasting more than 3 hours (Delpech, 2014). This case-law, equalizing the legal position of those passengers to the position of passengers with a cancelled flight in terms of compensation, has been characterized as a "legal bomb". Offering a kind of privileged protection to passengers' interests at the expense of financial interests of

the air companies involved, European judges initiated a jurisprudential line that has caused a great dislike to those enterprises and has upgraded the dynamic of lawyers' profession.

Nevertheless, in the comparable case "HQ, IP & JO v Aegean Airlines SA (C-163/18)", known as the "Aegean case", the Regulation on the matter was not interpreted widely (creatively even) and as a matter of fact, the airline involved was the winner. This case refers to the relationship between EU directives 90/314 and 2015/2302 on Package Travel and this text, which specifically excludes airlines' obligations to refund air fares to passengers, as required under Article 8(1)(a), where that flight forms part of a package holiday, as below:

Article 8(2). Paragraph 1(a) shall also apply to passengers whose flights form part of a package, *except for the right to reimbursement where such right arises under Directive 90/314/EEC.*

The claimants were met with an unfortunate set of circumstances, i.e. the tour operator (Hellas Travel BV, based in Holland) had become insolvent (in fact, this insolvency is what led to Aegean cancelling the flight to start with) (Parkinson, 2019). The Court of Justice of European Union, answering on questions upon a request of the District Court of Noord-Nederland for a preliminary ruling under article 267 of the TFEU, formulated the following position:

*"In the light of the foregoing considerations, the answer to the questions referred is that Article 8(2) of Regulation No 261/2004 must be interpreted as meaning that a passenger who, under Directive 90/314, has the right to hold his tour organiser liable for reimbursement of the cost of his air ticket, can no longer claim reimbursement of the cost of that ticket from the air carrier, on the basis of that regulation, even where the tour organizer is financially capable of reimbursing the cost of the ticket and has not taken any measures to guarantee such reimbursement".*

The European tribunal's answer is not to provide redress against the airline but, instead, for passengers to obtain a refund by applying in the UK's Air Travel Trust or the equivalent thereof in other EU member states. Failing that, recovery can be made against the State, in accordance with decisions *Francovich* (C-6-89 and C-9/90), *Rechberger and Others* (C-140/97) as well as *Baradics and Others* (C-430/13). However, one has to question how desirable it would be to make such a claim, especially as for a nominal sum. As to viability, various questions may emerge in EU countries, such as lengthy delays, the lack of recovery of legal costs or even corruption (Parkinson, 2019).

Anyway, air travellers seem to ignore their rights, according to various data, such as those of a primary survey among passengers, which was held in the "Makedonia" Airport of Thessaloniki, in January 2016 (Bounelas, 2016). Its target group consisted in passengers waiting for their flight, towards another Greek destination or abroad. The answers of those private individuals highlight the lack of knowledge on the law of air passengers' rights. The notion of a financial compensation for the damage suffered is inconceivable, in spite of the fact that in reality it constitutes a fundamental means

for the protection of travellers' legal interests. Besides, the average consumer has the idea that for inconvenient facts that take place in the air journeys the involved companies have no responsibility on almost all occasions, given that those facts are attributed to the weather, technicians, the system, strikers or sometimes even to the passenger himself. Just on the contrary, the EU competent institutions, including the judicial one, consider that the air transporter can almost always exert control on everything and for this reason they limit down drastically the cases of exemption from responsibility. These findings tie in with the position of claims management company "AirHelp", according to which 87% of air passengers do not know their rights or when they are eligible for compensation.

In February 2020, it was announced that EU authorities were planning to re-examine the Regulation 261/2004 "at the expense of consumers" and to the benefit of airline companies, according to the Federation of German Consumer Organizations (VZBV) and the Association of Passenger Rights Advocates (APRA) (GTP editing teams, 2020). Upon these rights groups, passengers would no longer be compensated for delays of three hours. Instead, flyers would be entitled to claim compensation when delays exceed five hours for long-haul flights of over 3,500 kilometers. For flights exceeding 6,000 kilometers in distance, eligibility for compensation would apply to nine-hour delays and over. Consumer rights advocates expected the delay limit to increase to 12 hours. A development like that would result in significantly reducing the number of cases seeking compensation. According to estimates of the "AirHelp", almost 80% could lose their rights. It is quite indicative that in 2018, some 16,5 million EU passengers suffered delays.

*Passengers' Rights in Virtue of Regulation (EC) No 1107/2006*

Regulation (EC) No 1107/2006 of the European Parliament and of the Council of 5 July 2006, concerning the rights of disabled persons and persons with reduced mobility when travelling by air, is relevant to articles 21 par. 1 and 26 of the Charter of Fundamental Rights of the European Union as well as articles of European Constitutions, such as article 21 par. 3 of the Greek Constitution (Maniatis, 2016).

In virtue of article 3 of this Regulation, an air carrier or its agent or a tour operator shall not refuse, on the grounds of disability or of reduced mobility to accept reservation for a flight departing from or arriving at an airport to which this Regulation applies as well as to embark a disabled person or a person with reduced mobility at such an airport, provided that the person concerned has a valid ticket and reservation.

However, this rule is not exempted from derogations, which are previewed in article 4, for reasons of safety or technical ones. Besides, article 12 foresees that where wheelchairs or other mobility equipment or assistive devices are lost or damaged whilst being handled at the airport or transported

on board aircraft, the passenger to whom the equipment belongs shall be compensated, in accordance with rules of international, Community and national law.

*Passengers' Rights in Virtue of Directive (EU) 2015/2302*

EU for the first time adopted a legislation on package travel through the aforementioned directive 90/314/EEC. Package travel was conceived as a combination of two different types of services, such as transport and accommodation. That pioneer directive was transposed in the Greek legal order in delay, let alone not in a creative way, through the adoption of presidential decree 339/1996. Due to its various defects, it was repealed by the above mentioned directive (EU) 2015/2302 of the European Parliament and of the Council of 25 November 2015 on package travel and linked travel arrangements, amending Regulation (EC) No 2006/2004 and Directive 2011/83/EU of the European Parliament and of the Council. According to Whereas (2), the new directive aims to adapt the scope of protection to take account of those developments, to enhance transparency, and to increase legal certainty for travellers and traders. The doctrine has commented that it is about a very consumerist directive (Feliu Álvarez de Sotomayor, 2018). More precisely, this text is protectionist of the party which is considered as weaker from a legal point of view, exemplified by consumers and retailers. To avoid confusion with the definition of the term "consumer" used in other EU legislation, consumers should be referred to as "travellers". This technical choice of the legislator enhances the separate profile of Travel Law against other similar branches, such as Consumer Law, Tourism Law and Transport Law.

The current directive constitutes an important step forward, representing the current era of 4G fundamental rights, which could be considered to have begun in 1992, so after the adoption of directive 90/314. The new text results text inter alia in saving money for traders by getting rid of their obligation to give a brochure in physical form to their clients. This simplification of commercial process proves to be environmentally friendly. The consumer protection ties well with the environmental policy, particularly on the basis of the principle of environmental integration, which since 1997 is a requirement under the EC treaty. The importance of this principle is reaffirmed in the Sixth Environment Action Program whilst transport has constituted one of the areas, in which integration is officially applicable.

Among the guarantees consecrated by the directive, there is the right of travellers that cannot return from their package holidays on time, for instance in case of natural disasters, to be granted accommodation for up to three nights. Besides, additional nights are covered in line with the relevant passenger rights regulations.

## SHARING ECONOMY IN TOURISM SECTOR

### *Tourism Sector, the Emblematic Field of Sharing Economy*

At the end of the first decade of the current century, a new form of economic relations emerged. It is about collaborative economy or sharing economy, which is a marketplace where consumers rely on each other instead of large companies to meet their needs. This peer to peer system is based on specialized digital platforms. The sector of travel and tourism is particularly linked with this new trend, exemplified by Airbnb in the matter of short-term lease of flats. It is to put the stress on the fact that sometimes innovation related to collaborative economy emerged for needs of survival. More precisely, the majority of ideas which were transformed into successful startups were services created to meet a latent need (Rodríguez, 2015).

P2P services have experienced exponential growth, due to the fact that the platforms that have carried out them cover a niche that has not been covered until now, either by price or by experience. Those observations are valid particularly as far as tourism infrastructure is concerned. For instance, the emblematic enterprise "Airbnb" emerged to meet basic needs. Its creators offered an inflatable mattress in their house for rent and added breakfast ("Air Bed and Breakfast") to be able to pay the monthly rent for the apartment where they lived. In 2015, it was valued at 10 billion euros and had a number of rooms – without owning any – similar to the largest hotel company in the world. From then and on, national and subnational legislation on short-term lease contracts has emerged, in a more or less successful way. This regulatory role of the public power ensures the tax public interest and promotes the tourists' right to a safe and decent accommodation, in spite of some legal problems relevant to unconstitutional rules on the matter.

Furthermore, Airbnb has served as a role model for other forms of entrepreneurship in the framework of collaborative economy, especially in the tourism market. In a parallel way, Uber was originally founded as Ubercab, in 2009, and is nowadays a huge American multinational ride-hailing company, offering various services, such as inter alia P2P ridesharing.

It is notable that ridesharing practice is no innovation of the sharing economy era. This practice between co-workers or neighbors dates back from the 1970s and was elaborated and facilitated by the recent technological advances increasing trust between strangers (Guyader, 2018). Nowadays, BlaBlaCar, a French online marketplace for carpooling which was founded in 2006, exemplifies the way of travelling together between cities and sharing the cost of the journey. Its members trust each other almost as much as friends and family members do. However, many of them describe feeling cheated by, and "at war" with this company for making an ad hoc practice more commercial and less altruistic.

*The Human Right to Be a Guide: a Deregulated Profession*

Since a lot of time, the doctrine has signaled that it is worth consecrating “new” specific rights, such as the right to travel information on the destination in flight (Maniatis, 2016). If this right seems to be totally marginal, there is an important tendency to promote tourism destinations by the air transporters in their free magazines, which passengers can not only read in flight but also take at home. In a complementary way, some air companies offer electronic information in passenger’s monitor during the trip. The trend of client’s magazine may be correlated to a very long tradition consisting in guidebooks or travel books.

It is notable that the tourist guide’s profession has become an official job, regulated by specialized national legislation since almost a century. This is valid for Spain, whose first legal reference dates from 1928. Travel guide has a remarkable polymorphism, consisting in human beings and books, and is comparable to the status of fashion models, which emerged in the nineteenth century in France, whilst mannequins, in form of wooden dolls, were already in use some centuries earlier.

A similar trend is related to tourist information, consisting in free tours. These tours could be held as free, for the following reasons:

1. *The free character of the relation between guidance parts and of the guide’s employment*

No labor relation is produced between the guide and the guided persons, which may quit from the guiding tour anytime. Furthermore, the guide is, as a general rule, a freelance provider, not an employee of an enterprise endowed with a relevant digital platform, although he usually has a professional relation with a company of that category, such as Free Touring, Strawberry tours, Freetour.com etc. (Maniatis, 2020). In some cases, companies are entitled to a commission per guided person. Besides, guides and other members of local societies make use of new digital platforms to offer free tours and other tourist services directly to the public. This is the case of enterprises having the legal form of association, such as Cuéntame Toledo as well as Free Tour Madrid, being the owner of the platform “Madrid a Pie”. In the framework of this non-profit legal scheme, guides are employees who are paid directly by the guided persons, in case of free tours, and from their employer, in case of paid tours. It is to pay special attention to the fact that the type of legal person of civil law “association” seems to be favorable not only for guides, who take advantage of Labor Law rights, but also for the legal person itself, which is fully exempted from fiscal obligations. As associations are regarded as mainstreaming examples of social economy, they have the privilege of tax exemption and so they are encouraged to get involved into competition against the classical business schemes, such as companies of Commercial Law.

2. *The non-payable character of the delivery of services (tour gratis)*

The walking tour lasts from 1 to 3 hours (usually 2 hours) and is not exactly gratis but constitutes a profession on behalf of the guide. Basically, it may be held gratis with some eventual exceptions of rather minor importance, such as:

- A commission for making a reservation through the digital platform involved, although GuruWalk, a Spanish startup which would like to become recognizable as a brand name like Airbnb in the matter of accommodation, soon ended this economic burden for all free tour "walkers",
- In case of persons who would like to participate in a group that has already covered the maximum number of participants, as set by the platform business.

The members of the guided group have the right (not also the obligation) to pay a sum of money, as a tip, just at the end of the tour, in the framework of a donation contract. The guide gets money directly from guided persons as long as they are satisfied from the result of the tour. For this reason, there is the informal denomination in Spanish "taquilla inversa" (reverse ticket office). So, guide's remuneration depends on the degree of satisfaction but also on other factors, such as the financial situation of the guided person, his culture for gratuities etc.

Free tours constitute a pioneer alternative to offer knowledge on a city to visitors, particularly to (foreign) tourists but also to residents. Sightseeing in this way is a real innovation, particularly because it refers mainly to individuals who would not pay for tourist information. So, not only has a new service emerged but also a new target group.

It is also to put the stress on the fact that this very popular delivery of services worldwide has led in a few places, such as the Autonomous Community of La Rioja (not the entire State of Spain), to liberalization of guide's profession. The Autonomous Community of Madrid fully liberalized this activity in virtue of Law 8/2009, in the context of adaptation to directive 2006/123/EC of the European Parliament and of the Council of 12 December 2006 on services in the internal market. Nevertheless, it is to clarify that the famous directive Bolkestein (or the services directive) did not impose the abolition of the regulated character of this job.

Due to this audacious political initiative of the most important Spanish Autonomous Community, there have been two forms to offer tourist information. On the one hand, the activity of "tourist guide" has been liberalized to such a pitch that anyone is enabled to enact this role, as a work or as a hobby. It results an authentic guarantee, consisting in the human right to guide either a private individual or a group of persons. This liberalization has a global character, including the classical qualification of foreign languages. It puts an end to the limitation relevant to language being used in the framework of tourist information whilst, as a general rule, in comparative law qualified guides are enabled to guide uniquely in the accredited language or through the service of an interpreter without

prejudice to the professional interests of the guides qualified in the required language. For instance, according to article 3 par. 4 of decree 7/2020 of the Autonomous Community of Castilla-La Mancha, the work of tourist information must be carried out by a licensed tour guide in the group's language and only in the absence of a guide with that qualification, the work will be carried out by a licensed guide, accompanied by a translator. Alternatively, the guide may count on the services of a second guide qualified for the translation tasks. The freedom of tourist information implicates a full autonomy of the provider, against classical "regulated professions" (namely being subject to public licensing for their exercise), like the jobs of a licensed tourist guide and an accredited translator. In this way, both beginners in the tourism sector and professionals, such as tour leaders, are facilitated.

On the other hand, there is the new figure called "official tourist guide", consisted in an accredited professional, as defined by article 2 of decree 18/2017 of the Government Council. This property, called through this neologism, constitutes a quality seal, at the same time that said certification allows access to professional training and improvement actions, as well as benefiting from the promotion actions carried out by the Autonomous Community of Madrid, according to article 5 of this decree. With this text, the multiple and constant requests for regulation by the accredited guides were answered. Those professionals considered that there was a situation of deregulation of their job, a clear intrusion, in addition to a comparative grievance (Gutiérrez Duarte et al., 2020).

To sum up, unofficial guides have been enabled to accomplish this mission, let alone explicitly with the title of "tourist guide", as for at least the Autonomous Community of Madrid. For instance, lawyers enact the role of free tour guide as a hobby in the Spanish capital, gaining a relatively limited amount of money. So, certified tour guides have acquired various competitors but some of them enact the free tour role, to enhance their income. Anyway, the entrepreneurial success is double as long as there have been duplicated the types not only of guides (with the legitimization of informal guide's business) but also of guided persons (with the emergence of a new target group, through free tours).

## **CONCLUSION: "SHARING ECONOMY, SHARING RIGHTS"**

The paper hypothesis has been confirmed, although it is to clarify that collaborative economy constitutes only one of the factors having an impact on the content of Travel Law. For instance, regulations on digital platforms, such as Airbnb, have been adopted and, as a general rule, have been gradually evolved into a liberal regime on the matter, contesting the hotelier's traditional role. However, the most important revolution has occurred in another field of sharing economy, which refers to tourist information. A one-century regulated profession of private individuals has been transformed into a sign of quality whilst a new right has emerged, consisting in the freedom to guide.

This development is not attributed uniquely to sharing economy but mainly to the generic new wave against the closed professions, exemplified by the services directive.

Prima facie, sharing economy has contributed to the emergence of the dynamic phenomenon of sharing rights between unequal social groups, such as official guides and the rest society. Nevertheless, as it happened in the Autonomous Community of Madrid 8 years later, there is an informal but very intense tendency, in the framework of comparative law, to establish a hierarchy of legal conditions between the aforementioned groups, highlighting the superiority of accredited guides. In the current status of normativity in that Autonomous Community, official guides have acquired the authentic "privilege" to be a guide, let alone with the title "official tourist guide" against the universal "right" (economic freedom) to be a "tourist guide". It is about a very intense controversy, which is still actual, whilst the formal representative organization of official guides of Spain has made use of a campaign based on the neologism "turismofilia", namely hospitality. Anyway, the remark on the expansion of rights (either traditional or new ones) due to sharing economy is valid, in general, so the motto "Sharing economy, sharing rights" could be produced.

As already signalized, States and legislators have to cope with new rights and professional roles, such as the rights to be a guide particularly in free tours and to enact the role of quasi hotelier, through digital platforms, such as GuruWalk and Airbnb respectively. However, Travel Law is produced more and more by private individuals to enhance their income and ambitious start-up companies.

Besides, Regulation 261/2004 constitutes one of the most successful legislative acts on compensation of flight passengers in comparative law, particularly on account of the relevant right consecrated by jurisprudence. We consider that this pioneer right should not be deconstructed through an eventual legislative initiative, such as the recent European one, but it deserves being transformed into positive law. In general, Travel Law and Tourism Law could acquire a more anthropocentric and inclusive dimension whilst sharing economy is of major importance on the matter.

Furthermore, the constitutional right to tourism is marginal, if not inexistent. Its specific version consists in the right to be guided and is combined with the newly established freedom to guide. So, it is about a global right to tourist information, as the term "information" is conceived in both passive and active senses.

It is also notable that there has been the phenomenon of reversing the role of the official tourist guide, compared to persons, such as the tourist and the informal guide, for example on the very competitive case of free tours, and to things, such as the travel guides (books) (Maniatis et al., 2020). This phenomenon happens on international scale whilst another reversal has already been produced, at a national level. To date, literature on tourism has almost thoroughly ignored the fact which could be marked as prophetic of the new developments in the tourism sector. In Greek, the tourist is called

either “tourist” or “periigitis”, a word that means a person who visits destinations for leisure purposes and in ancient Greek was used to denote the guide against “teoros” (tourist) and, in a limited way, the authors writing down their knowledge which was acquired through their travels.

\*\*\*

The current study started with a reference to the famous novelist Jules Verne, as the Father of Science Fiction relevant to travels. Fiction continues to be something valuable but new rights should be recognized and be incorporated into social reality. For instance, the right to happiness or to serenity, whose right to serene vacations would be one of its versions, has been unrecognizable by a part of the doctrine. Moreover, Italian jurisprudence has considered the right to happiness “totally imaginary” (Ferro, 2014). However, the right to pursuit of happiness constitutes a classical civil right, of the first generation of fundamental rights in the history of humanity, which could be regarded as existent (Maniatis, 2017). At least as for the similar right to serenity, this guarantee is based on the innovative article 46 (ex article 47) of the Italian Tourism Code on the compensation of “damage from ruined vacation”. The right to serene vacation, let alone the generic right to vacation, is no science fiction...

## UNVEILING THE VEIL OF SPORTS LAW

**Maniatis, Antonios**

Department of Business Administration of Agricultural Products and Foods, University of Patras (UPATRAS), Agrinio, Greece

### ABSTRACT

Sports Law constitutes a separate field of law, which is covered by a veil of mystery with various peculiarities. It is connected with the phenomenon of an intensive tendency of acquaintance of social groups with sport context. This tendency is facilitated by the fact that Sports Law is explicitly considered to include even norms that are not specifically applicable to athletic institutions. In civil law countries, there is also the tendency of publication, in the sense of conversion of law into Public Law (not only Administrative Law but also Constitutional Law). Besides, the question of recognition of neighboring rights to athletes is not inexistent but remains marginal whilst a gradual upgrade of their rights has been noticed, the last decades. Last but not least, the lawyer's figure is comparable and relevant to many of these aspects of Sports Law.

*Keywords: Lawyer; Neighboring / related rights; Publication (Conversion of law into Public Law); Sports Law; Theory on acquaintance of social groups with sport context*

### INTRODUCTION: THE RULES OF THE GAME

Sport seems to have been a leisure activity for everybody since antiquity. As sport games were created, that activity by nature was subject to some rules. At a first level, players themselves and, later, at a second level, the official authorities have enacted the crucial role of the "legislator" on the matter. The current paper aims at highlighting unnoticed or marginal aspects of the content and application of Sports Law through the comparative context in order to promote the international academic research on the matter.

First of all, it sheds light to the phenomenon of acquaintance of social groups with the sport context. Furthermore, it examines the tendency of conversion of law into Public Law, at least as far as civil law countries are concerned.

Then, it goes on with various aspects of the rights of athletes, mainly the professional ones.

At the end, it proceeds to a global approach, reaching to some critical remarks on Sports Law.

## **THE THEORY ON ACQUAINTANCE OF SOCIAL GROUPS WITH THE SPORT CONTEXT**

Sports Law is not merely a kind of legislation, being made of heteroclitic rules localized in various forms of legislative acts. It is about a specific branch, including some norms on the social phenomenon of athletic activity (Maniatis, 2017). However, this field is not based uniquely on these special rules but also has to do with a set of norms of “common law”, namely destined to be applicable in a wider context, such as the relevant to labour relations.

For instance, a lawyer representing an organization specialized in sports has to make use of lease law, as long as his client wants to exploit a building through this form of contract. The doctrine does not omit to signalize that Sports Law, in a wide sense, has to do even with general normativity, as it happens to be applicable in case of athletes and institutions of the athletic market (Malatos, 2010). This phenomenon may appear self-understandable, but it is unusual to clarify it explicitly, as far as other branches are concerned. So, it results that Sports Law has a tendency to expand its field or, more precisely, to be adaptable to a wider normativity, as long as no ad hoc rules are adopted. Obviously, this tendency promotes the interests of the involved factors, such as lawyers that may invoke their experience in contracting matters of their clients as a professional experience in Sports Law.

Besides, it is notable that the opening of a personal career to this field, whose applicability is rather limited in social practice, may be held quite by chance. In the Greek legal order, the lawyer with a permanent salary command of the legal person of a municipality serves *ipso iure* the rest legal persons under public law, which are supervised by the municipality. So, he has to cope with the protection of legal interests of the municipal athletic carrier. It results that the expansion of application of this branch is facilitated by regulations like this. We suggest this phenomenon be called “acquaintance” of private individuals and social groups to the world of sports (or sport context). In this matter, it is quite eloquent the term being in use in the UK. This State makes a systematic use of the term “soccer” as for the most popular sport, football. According to an approach, this word refers to the concept of social ceremony, principally destined to be held on Sunday, with the massive attendance of fans in sport arenas.

## **THE THEORY ON “PUBLICATION” OF SPORTS LAW IN CIVIL LAW COUNTRIES**

*The case of Administrative Law and Public Administration*

Sports Law has traditionally a private origin and very rarely a State one whilst the scope of this branch consists in a product of society. On the one hand, its main characteristic is that its scope is ruled by private normativity. It has a great history and consists in production coming from the interested social

groups. It is about a branch marked by internalization of more or less wide groups or of the entire society. On the other hand, it is subject to the phenomenon which is called in Spanish “publicación”, namely “publication”, in the sense of making something public (producing or enhancing the character of the branch of Public Law). For instance, as far as Spain is concerned, the publication of normativity on sports constitutes a real fact. There are some authors that back up the opinion that Sports Law, being an autonomous and separate normative framework, is practically non-existent in this country, not enjoying its own individuality.

The doctrine signalizes that penetration of Administrative Law can be extended to other areas and is a consequence of the legislative “hypertrophy” to which Spanish society is subject (Valdés Escalona, 2014). Interventionism of Public Administration and subsequently penetration of both Administrative Law and Public Powers in the sector of athletic events are so extended that hardly remains any entity of fully private character, for self-organization and self-regulation of sports. This remark is valid in spite of the fact that Barcelona Football Club has the international peculiarity to be a company based on the people, far away from the classical scheme of an enterprise owned by a private legal or natural person, as a shareholder. In other words, unlike many other football clubs, the supporters own and operate Barcelona.

The described supremacy of the public over the private is not located in other countries, such as the USA, the UK and Germany, in which athletic activities have an essentially private nature. As for Greece, this country being endowed with a relatively very small surface but a great sporting history, makes use of a specific normativity, like Spain does. This remark is also valid for other mainstreaming European countries, such as France, Italy, Portugal etc. (Malatos, 2010).

Besides, it is notable that Greece not only exemplifies well the tendency of publication of Sports Law in many civil law countries against “common law” ones but in some crucial cases it runs the risk to downgrade the other mainstreaming tendency, consisting in the acquaintance of social groups with various aspects of athletic events. Focusing once again on lawyers’ community, it is to signalize that the Greek State has recently modified its legislation on Public Administration being competent against violence in sport arenas.

In the framework of publication of Sports Law, the political volunteer was to adopt stricter legislation against hooliganism and eventually to other similar forms of deviant behavior related to sports, particularly to football. To accomplish this mission, the State cleared out freelance professionals, such as lawyers, from the competent public organs by replacing them by judges. On the one hand, the emblematic figure of social reality of Sports Law, as already described, was marginalized. Advocates are no more enabled to enact the role of decision-maker, being limited to their traditional mission to cope with affairs of their clients in administrative procedures like these. On the other hand,

professional judges have acquired a double role, including administrative duties, which normally are performed by civil servants or freelance professionals, such as lawyers, and not by members of the judicial power. This tendency perhaps could be held as an opening to judges, on the basis of the theory of the acquaintance of social groups with sport context. However, hardly could this opinion be acceptable, as judges do not constitute a *stricto sensu* social group but a classical State Power against lawyers, who are freelance professionals, essentially making part of the society, at least in terms of economy. Even if lawyers are conceived as “public servants”, being auxiliary organs of Justice, it is obvious that their substitution by judges implicates an intensification of publication of the State mechanism on the matter. The polity sacrifices the prestige of a mainstreaming scientific job, such as the lawyer’s one, to highlight its deliberativeness to preserve social peace and public security against hooligans.

Anyway, the phenomenon of expansion of Public Law in traditional areas of Private Law is typical of modernization of normativity. For instance, the freedom of contracting proves to be more and more limited, to such a pitch that it has produced forms of obligatory contracts. This is the case of Collective Labor Agreements (CLA) or Collective Bargaining Agreements (CBA), which, just like the contract-law, are applicable even to persons that have not been contracting parties in the process of their conclusion (Barragán, 1965). So, Labor Law is no more a merely normativity of Private Law but a complex, *sui generis*, autonomous branch.

#### *The case of Constitutional Law*

As far as publication of Sports Law is concerned, we have the opinion that this phenomenon should not be conceived uniquely in the framework of Administrative Law, whose Specific Part includes normativity on sport Administration. Publication should be understood as an opening not only to Administrative Law and subsequently to Public Administration but also to Constitutional Law.

On the one hand, sport found at last a position in a Constitution just in 1936, in form not of a right to sport but of the generic right to social organizations (athletic associations). The next generation of humanity made the step forward, by recognizing explicitly in Cuban Constitution of 24<sup>th</sup> February 1976 that “*Everybody has the right to physical education, sport and recreation*”. In a similar way, a few days later, the universal right to physical culture and to sport was consecrated in the Portuguese Constitution. The year 1976 proved to be the year of inauguration of the right to sport in general, in comparative and international law. As for the Council of Europe, its formal policy on sports was initiated with the “European Sport for All Charter”, which was launched in 1975 by the European Sports Ministers. This document was officially adopted on 24<sup>th</sup> September 1976. From that date, sport policies in Europe were endowed with a common program, based on the conviction that the values of

sport would contribute to the fulfilment of the ideals of this international organization. It is quite indicative that article 1 foresees that every individual has the right to participate in sport.

The right to sport not only is comparable to another right implicating movement of the human body, such as tourism, but also is parallel to it. Both guarantees were consecrated for the first time worldwide in a Constitution, in the era of the second generation of fundamental rights (1917-1972). The Soviet Constitution was the first to incorporate explicitly the institutional guarantee of sport, as already signalized, whilst the 1947 Constitution of the Italian Republic made an explicit reference to "tourism and hotel industry", which paradoxically was eliminated through the 2001 amendment. Nevertheless, these rights have followed a very opposite tendency, in terms of their further constitutional consecration, worldwide and therefore the right to tourism remains marginal.

The right to sport implicates concrete public policies, being internal of States, to be guaranteed (Pachot Zambrana, 2016). The State in the matter of sport has three types of obligations, consisting in respect, protection and accomplishment (Zitlaly Flores, 2014). These remarks are indicative of the double character of Public Law; Constitutional Law is completed by the other component, consisting in Administrative Law. In a similar way, in Constitutional Law, besides the formal Constitution (including a Bill of Rights), there is also the material Constitution, having to do with fundamental rights and obligations of citizens and other persons. Obviously, the movement of publication has to do with the explicit consecration of the guarantee of sport in Constitutions worldwide and mainly with its regulation in laws. For instance, in the 1980s legal rules were adopted in Greece to promote the phenomenon of mass sporting, so the material Constitution was enriched as far as amateur sporting is concerned.

## **ATHLETES' RIGHTS**

Article 49 of the Treaty on the Functioning of the European Union (formerly Article 43 of the Treaty establishing the European Community) foresees that "*restrictions on the freedom of establishment of nationals of a Member State in the territory of another Member State shall be prohibited. Such prohibitions shall also apply to restrictions on the setting up of agencies, branches of subsidiaries by nationals of any Member State established in the territory of any Member State*". This article has been given wide application by the European Court of Justice, with no sector excluded, covering thus those within member state competence, such as healthcare and taxation (Benyon, 2016). A typical case having to do with lawyers' profession consists in the Gerhard case.

Similar remarks are valid for labor law relations, as it was the case of Bosman ruling (C-415/93). This 1995 jurisprudence of the European Court of Justice concerns freedom of movement for workers, freedom of association and direct effect of article 39 of the Treaty Establishing the European Economic

Community (now article 45 of the Treaty on the Functioning of the European Union). That case had an important effect on the transfers of footballers within EU. Prior to this jurisprudence, clubs in some parts of Europe (but not, for example, in Spain and France) could prevent players from joining a club in another country, even if their contracts had expired.

However, athletes are considered to be deprived of any neighbouring rights, like two other categories of private individuals. It is about mannequins and the participants in TV reality shows (Maniatis, 2018). Mannequins have evolved from wooden dolls to human beings with a tacit role, which may be protected by Labour Law, exemplified by the relevant disposition of French Labour Code, but not by Intellectual Property Law.

In reality, some countries, such as inter alia France, Italy, Mexico, the Netherlands and the USA, have recognized related rights for sport events (Townley, 2019). Besides, European Community, as reflected in its 2007 White Paper on Sport, has been aware of the specificity of sport and that it might be afforded further protection. In the joined cases involving Football Association Premier League versus QC Leisure and Karen Murphy versus Media Protection Services Limited (C-403/08 and C-429/08), the Court of Justice of the European Union acknowledged that *“sports events such as football matches cannot be considered intellectual creations or works and so cannot be protected by copyright.”* It was further noted, however, that the unique and individual character of a sports event can transform it into subject matter worthy of protection.

## **CONCLUSION: UNVEILING THE VEIL OF SPORTS LAW TO UPGRADE HUMAN RIGHTS**

The current paper has ended up to the following findings and critical remarks:

- a. An intense tendency of acquaintance of social groups with sport context (inclusive character of Sports Law)*

Sports Law has a particularly open character to society whilst both legal practitioners and the doctrine highlight and take advantage of it. This inclusive character of this separate branch of law ties in well with the universal, so inclusive, character of the right to sport. Anyway, the explicit constitutional consecration of this right has become a world trend, enhancing the acquaintance of society with sport activities.

- b. Publication of law on sports, particularly in civil law countries*

There is a very intense tendency of publication of normativity on sports, particularly in civil law countries against common law ones. This trend of conversion of law into Public Law, just like the precited tendency of acquaintance with sport context, is well exemplified by the role of freelance lawyers. Publication is not necessarily a negative phenomenon, let alone the fact that it may implicate

an enrichment of human right to sport, either in the formal Constitution or mainly in the material one. For instance, it is to underline the right to be a sport fan, which ties in with the question of confrontation of violence committed in athletic places.

*c. The gradual character of recognition of athletes' rights*

Athletes have gained territory in terms of their legally protected rights, in the last decades, particularly in the EU context, particularly as for the freedom to change an employer, in the framework of Labour Law. Nevertheless, the question of recognition of neighbouring rights remains marginal, though existent in opposition to mannequins' related rights.

To sum up, as signaled by the doctrine (Pachot Zambrana, 2016), normativity on athletes and sport activities have been subject to relatively limited academic elaboration to such a pitch that various aspects of its profile remain relatively unknown or deprived of research in the international context. The time has come to unveil the veil of Sport Law, let alone in favour of human rights...

## EGYPTIAN MARITIME LAW

**Maniatis, Antonios**

Department of Business Administration of Agricultural Products and Foods, University of Patras (UPATRAS), Agrinio, Greece

### ABSTRACT

Egypt is endowed with a Maritime Law having a wider impact, particularly due to the Suez Canal, whose transit is open for all vessels according to the relevant 1888 Convention. This member state of the Spitsbergen treaty and of the 1982 United Nations Convention on the Law of the Sea is emblematic of the one-century gradual tendency of liberalization of navigation in areas and zones different from the classical zone of high sea, against the national sovereignty of the coastal State involved (1888-1982). Egypt has exploited in a very extended way the opportunities offered by International Law, by creating optional zones of the Law of the Sea, such as contiguous zone and EEZ, and also by offering the best possible protection to underwater antiquities, as foreseen by the UNESCO Convention on the protection of the underwater cultural heritage. Last but not least, although EastMed is not directly relevant to Egypt, Greece has established a significant, multilevel collaboration with this neighbor country, the last years. Egypt has formed the Eastern Mediterranean Gas Forum, which also includes Greece, Cyprus, Israel, Italy and Jordan, and has signed the agreement on the partial delimitation of EEZ with Greece.

### INTRODUCTION: EGYPT

The name "Egypt" has an ancient Greek origin, meaning the country south of the Aegean Sea. This State has fostered significant bonds with the nearby country of Greece. For instance, the Greek people had a port on the Canopic branch of the Nile river, Naucratis or Naukratis. That city, situated 72 kilometres southeast of the open sea and Alexandria, was the first and for a long period of time the unique permanent Greek colony in Egypt. It is also notable that the two neighbours have had violent incidents in their relations. In the battle of Salamis, held on 29 September 480 BC at the straits between Attica and the island of Salamis, Egyptian warships took part on behalf of Persians, given that Egypt belonged to the Persian Empire. Perhaps it is quite indicative of the relations which Egypt and Greece could have, that Egyptians did not take part directly in the violent confrontation, because

they executed orders to block the eventual departure of Greek warships. The battle of Salamis constitutes one of the most significant facts in the world history, which stopped the imperialist expansion of Persians, safeguarded sovereignty of Athenians and their allies of other Greek city-states and protected the so-called "isonomy" of citizens. Isonomy, later called democracy, is the most important invention inherited by ancient Greeks to mankind.

Nowadays, the Arab Republic of Egypt is very big, in both terms of territorial size and population. In February 2020 it exceeded the limit of 100,000,000 inhabitants (Goujon, 2020). Besides, it is endowed with the sixth biggest war navy worldwide and the biggest among the African States.

The current paper aims at introducing to the Egyptian Maritime Law in a wide sense, including the rules of the Law of the Sea.

## **EGYPTIAN MARITIME LAW**

The legal system of Egypt is considered as a civil law system, in the framework of the generic distinction between common law countries and civil law ones. It is based on a well-established system of codified laws (Abdel Wahab, 2019). Egypt's supreme law is its written constitution whilst this country exemplifies the African trend of operation of a Constitutional Tribunal.

The most important legislation on contracts is the Egyptian Civil Code of 1948. As for Maritime Law, the first Egyptian law was issued in 1883, which took many of the items from the French law. It is notable that there is not a single approach to this set of norms, in Comparative Law. For instance, in Italy Mussolini's regime in an authoritarian way established a common Code on maritime transport and aviation. It is about the Navigation Code, published in 1942. Therefore, Navigation Law is defined as the set of rules governing the matter of navigation, be it maritime, internal (exercised on rivers, canals and lakes) or air - understood as a unitary complex of relations pertaining to navigation (Fiale, 1992).

Currently in the Egyptian legal order, Maritime Trade Law No. 8/1990 is applicable, which governs inter alia the marine insurance. This mainstreaming law, in articles 292-301, deals with the maritime danger of collision accidents. The provisions of such articles are identical to the provisions of Brussels Collision Convention, of 1910, to unify the regulation of such collision on both of the national and international levels (Saleh, 2017).

## **EGYPT UPON THE SPITSBERGEN TREATY**

Egypt ratified the Spitsbergen Treaty, which was signed in Paris in 1920, in September 1925 whilst Greece followed, in October of the same year. This treaty foresees a sui generis, unique legal regime on the arctic archipelago of Spitsbergen, now called Svalbard. Although that terra nullius became an

overseas part of the Kingdom of Norway, a limited quasi sovereignty of the rest contracting parties was established, for instance as far as fishery, hunting and mining activities are concerned (Maniatis, 2019). Egypt is endowed with a long tradition in capture fisheries in marine and fresh water whilst in 2013 aquaculture production surpassed capture fishery production. So, this country, which is almost the unique African member state of the Spitsbergen Treaty, could enact an active role in the Svalbard Archipelago (at least in the territorial waters, if not permitted in the Fisheries Protection Zone).

Besides, it is notable that the Spitsbergen treaty consecrates the fundamental right of both ships, put into Svalbard ports, and of private individuals, exemplified by seafarers working in the ships on the matter, to relax. Relaxation is omitted by the English version of the treaty, which is a quite paradoxical matter but goes in with the spirit of the very recent creation of the ILO, consisting in the Maritime Labor Convention (MLC). So, the treaty could be slightly seen as a precursor of the fourth pillar of International Maritime Law, namely MLC. In general, this text is also indicative of the wider phenomenon of the anthropomorphism of ships in Maritime Law. So, it results a paradox coming from the content of this classical treaty of the Law of the Sea, which is not uniquely a pioneer convention of this branch of law, being still customary, but also emblematic and modern as far as Maritime Law is concerned. This phenomenon has been called the 'Maritime Law paradox' (Maniatis, 2018a) and constitutes another aspect of the paradoxical content of this treaty, which combines "full and absolute sovereignty" of Norway with "equal enjoyment and access" of States like Egypt and even landlocked ones.

## **EGYPT UPON THE LAW OF THE SEA**

Egypt signed the United Nations Convention on the Law of the Sea (UNCLOS) on 10 December 1982 and ratified it on 26 August 1983. The Convention was modified through the "Agreement relating to the implementation of Part XI of the United Nations Convention on the Law of the Sea", a few months before its activation (Maniatis, 2018b). The second text, signed in May 1994, amended the first one, as for the novelty of the Area of the International Seabed. It has been ratified by the vast majority of States but three United Nations members states (Egypt, Sudan, USA) have signed it but have not also ratified it. Egypt signed this document on 22 March 1995 whilst Greece ratified both the Convention and the Agreement in that year, just as these countries were associated to the Spitsbergen Treaty.

Egypt exploits a great variety of zones and rights upon the current Law of the Sea. It has a 12 nm territorial sea, as the vast majority of countries, and therefore a 12 nm contiguous zone. According to article 33 par. 2 of the UNCLOS "*The contiguous zone may not extend beyond 24 nautical miles from the baselines from which the breadth of the territorial sea is measured*". This country exemplifies the group of countries, along with South Yemen, Poland and Bangladesh, which has extended its jurisdiction in the

contiguous zone, as for security issues (defence targets) (Alexopoulos and Fournarakis, 2015). This kind of competence is not recognized by UNCLOS.

Being one of the three mainstreaming "archaeological countries", along with Greece and Italy, Egypt ratified on 30/08/2017, the UNESCO Convention on the protection of the underwater cultural heritage. This Convention, which does not implicate any changes in the zones consecrated in UNCLOS, was adopted in 2001 and entered into force on 2 January 2009. Italy ratified it on 8/1/2010 but had already incorporated its content, in an informal and preliminary way, in 2004 (Maniatis, 2018). Anyway, Greece did not sign this text and has not been a contracting party, to date.

Egypt has established an Exclusive Economic Zone (EEZ) in the Mediterranean Sea and the Red Sea. Cyprus signed EEZ delimitation agreements of its EEZ, activated in 2004, with Egypt (2003), Lebanon (2007) and Israel (2010). The delimitation effected with these agreements is based on the median line method, being typical of the practice of the Law of the Sea.

During Hosni Mubarak's presidency, Greece sought to demarcate its maritime borders with Egypt, but it received no response. In January 2011, Arab Spring emerged and new political regimes have resulted in Egypt. Following the coup of 3<sup>rd</sup> July 2013 against the first democratically elected President, a new regime emerged, that of the President Al Sisi. Egyptian, Greek and Cypriot military relations have become tighter, with a tripartite security agreement, which was signed in 2015. These States of the Eastern Mediterranean began conducting the joint military exercises known as Medusa, in the same year. Never before, at least in the last decades, the relations between the Egyptian State and the Greek one have been so good, in spite of the fact that the Eastern Mediterranean pipeline (or simply EastMed) does not have to do (directly) with Egypt. EastMed is a planned offshore/onshore natural gas pipeline for the transport of natural gas from the off-shore gas reserves in the Levantine Basin into Greece, and in conjunction with the Poseidon and IGB pipelines into Italy and other regions of Europe. This work is developed by IGI Poseidon S.A., a joint venture of the Greek "Public Gas Corporation" and the Italian gas utility "Edison". In January 2020, the EastMed Pipeline accord was signed by Greece, Cyprus and Israel and was approved by the Greek Parliament, through Law 4687/2020.

Furthermore, Greece must emit maritime spatial plans till 31 March 2021 for the environmental protection of its sea zones, after an exchange of views with neighbor States, upon Directive 2014/89/EU of the European Parliament and of the Council of 23 July 2014 establishing a framework for maritime spatial planning. It is notable that so far, the EU's desire to regulate maritime matters has yielded mixed results. One can see considerable benefits in implementing international conventions into the EU legal system but it would be desirable when this is done, to clarify vague or contentious provisions of the relevant international regime in the implementing secondary legislation so that a

more harmonized regime could be achieved within EU (Soyer, 2016). According to Whereas (1) of this directive, the high and rapidly increasing demand for maritime space for different purposes, such as installations for the production of energy from renewable sources, oil and gas exploration and exploitation, maritime shipping and fishing activities, ecosystem and biodiversity conservation, the extraction of raw materials, tourism, aquaculture installations and underwater cultural heritage, as well as the multiple pressures on coastal resources, require an integrated planning and management approach. It is estimated that it is about a challenge for Greece to broaden its territorial sea and declare its EEZ.

Anyway, Greece made an important step forward by signing the Convention of 9<sup>th</sup> June 2020 with Italy, as for the delimitation of EEZ of these countries. It is about the first time that Greece managed to declare an EEZ, let alone with an ally country, such as Italy.

Furthermore, Greece signed with Egypt an agreement on 06.08.2020, designating an EEZ in the eastern Mediterranean between the two countries. Although it is about a partial accord, which has not to do with the sui generis case of Kastelorizo and two other Greek islets of the same region, it fits in with the already expressed rejection of the 2019 memorandum on demarcation of Turkish and Libyan EEZ. Turkey and the internationally recognised government of Libya agreed to maritime boundaries in a deal that Greece and Egypt decried as a violation of international law. According to Greece, that memorandum infringed on its continental shelf and specifically that off the island of Crete.

Last but not least, Egypt has formed with other countries, such as Greece, Cyprus, Israel, Italy and Jordan, the “Eastern Mediterranean Gas Forum”, which aims to develop the region’s gas market. This mainstreaming State hopes to become an energy hub through the fast growth in its natural gas supplies.

## **THE SUEZ CANAL**

The Suez Canal connects the Mediterranean and the Gulf of Suez in the Red Sea. When it opened in 1869, operation was committed to the Universal Suez Canal Company pursuant to a ninety-nine year concession. There is no generic international convention on the use of canals, worldwide. Just the opposite, there is an ad hoc convention, which was stipulated a long time after the completion of this technical work. The Constantinople Convention Respecting the Free Navigation of the Suez Canal, of 29 October 1888, has been the first treaty in the history of International Law to declare the principle of freedom of use of a sea canal by ships of all nations.

The major political unrest linked to the Suez Canal, known as the Suez Crisis, started in July 1956, when the then Egyptian President Gamal Abdel Nasser nationalized the Canal and closed the Straits of Tiran (Mohit, 2019). The decision resulted in the invasion of Egypt by the UK, France, and Israel. It

was only after the intervention of the United Nations, the three forces withdrew from Egypt, allowing the country to reopen the Canal for commercial shipping. The political unrest, however, continued for a long time to come and the Canal was shut down by the Egyptian authorities in 1967 during Six-day War between Israel and Egypt. It is to signalize that this institutional adventure of the concession on the Canal resulted in discouraging a very long duration of a concession contract, in Comparative Law. Suez is relevant to various developments from a technical point of view. First of all, the disappearance of sailboats at the end of nineteenth century is associated to the opening of the Canal, given that this construction was difficult to pass by such ships (Guillaume, n. d.). More recently, closing the Canal (1967-1975) contributed indirectly to the imposition of gigantism of ships. The use of the route of the Cape of Good Hope could only be offset by the increase in the size of large carriers. The Canal is also relevant to geopolitical revolutions, given that it punctuated the discreet clashes between France and the United Kingdom, before the 1956 crisis sanctioned or revealed their decline, in favor of the USA and the Soviet Union. In its current status, the most important part of its legal regime consists in the "Rules of navigation", being available in the website of the Suez Canal Authority. Article 1 foresees that "*Transit through the Suez Canal is allowed to vessels of all nations subject to comply with the conditions stated in the present Rules of Navigation*". These rules determine the operation and the organization of the management of the Canal by fixing the competencies of the authorities of the Canal and the maritime administrative services being relevant to the navigation in it (Ahmed, 2015).

Besides, straits and canals are not about to leave the concerns of State leaders and maritime players, as the rise in traffic on the Suez Canal shows: from around thirty million tonnes at the end of the Second World War, transit rose to more than 900 million tonnes in 2013, just before new works in 2014 and 2015 to improve the flow of the passage (Guillaume, n. d.). In 2015, Egypt completed a major expansion of the Canal that saw the deepening of its parts and the construction of a second 35km-long shipping lane along part of the main waterway (Mohit, 2019). According to varying intensities, the influence of globalization and the interests of the great powers weigh on these sensitive places, and local territories can benefit from them and organize themselves around projects derived from market flows (Guillaume, n. d.). Singapore, where about 30% of world trade flows, is the most advanced figure.

However, it is also to make a reference to the case of the Panama Canal, which is comparable in many aspects to that of Suez. This construction depends particularly on the management of water, having an artificial big lake, Gatun Lake, as the main source of water for the waterway. A necessary modernization to cope with competition was held in a parallel way to the aforementioned technical works relevant to the Suez Canal. It is about a new canal and new locks (which opened in June 2016),

allowing the passage of neo-Panamax ships (up to 13,000 containers) against the traditional locks, permitting the passage of Panamax ships (up to 5,000 containers) (Guillaume, n.d.).

The project of the canal of Nicaragua to allow the passage of post-Panamax vessels (up to 25,000 containers) has been a proposed shipping route through Nicaragua to connect the Caribbean Sea and therefore the Atlantic Ocean with the Pacific Ocean. However, this technical work probably will not be constructed. Anyway, the Chinese proposals to overtake Panama with it testify to China's desire to assert itself as a great power (Guillaume, n.d.).

## **CONCLUSION: EGYPT, THE SYMBOL OF FREEDOM OF NAVIGATION**

Due to the presence of the Suez Canal, maritime traffic in Egyptian waters is very intense and subsequently Egyptian Maritime Law has a wider impact. This construction has proved to be of major importance not only in geopolitical and technical terms but also to juridical ones. The liberty of use of the Canal ties in with the most important rule of the entire Law of the Sea, which consists in the freedom at the high seas, particularly as far as navigation is concerned. The oldest current State of the world offers to mankind, particularly to the Greek nation which is the leader in terms of tonnage of owned ships of merchant navy, one of the four most important interoceanic passages, along with the Panama Canal, the Strait of Malacca and the Strait of Hormuz.

We consider that the freedom to transit through the Canal could be seen as a precursor of the sui generis regime of the Svalbard Archipelago, to which Egypt is an equal partner in virtue of Spitsbergen Treaty. The doctrine has not highlighted this tendency of liberty, which is localized in particular areas of the Law of the Sea. It is about a significant phenomenon beyond the high sea and is exemplified by the Suez Canal and the territorial waters of Svalbard, as these areas have Egypt in common. Last but not least, the liberalization went further in UNCLOS, as for the international navigation straights with the right to transit passage (instead of the right to innocent passage) as well as the eventual archipelagic sea lanes of archipelagic States (according to article 53 par. 2 of UNCLOS), with the "right of archipelagic sea lanes passage" which is equivalent to the right to transit passage. It results a one-century gradual tendency of liberalization of navigation in areas and zones different from the classical zone of high sea, against the national sovereignty of the coastal State involved (1888-1982).

Furthermore, Egypt has exploited in a very extended way the opportunities offered by International Law, by creating optional zones of the Law of the Sea, such as contiguous zone and EEZ, and also by offering the best possible protection to underwater antiquities, as foreseen by the UNESCO Convention. However, there are some legal and political issues to cope with, being relevant to the

defensive use of the contiguous zone and the question of ratification of the 1994 Agreement, which modified the initial version of UNCLOS.

As for the relations of Egypt with the Hellenic Republic, it has significantly upgraded them, from 2015 and on. Greece has managed to find the ally-neighbour it had been looking for rather in vain for decades, not to speak about the variety of historical features these countries have in common. This upgrade of relations between these famous civilizations may be conducive to socioeconomic development and political stability in the entire region of the Eastern Mediterranean and in a wider context. Similar remarks are valid in the matter of other Mediterranean countries, such as Greece and Italy, which are much more motivated to cooperate, particularly in the EU framework, being exemplified by Directive 2014/89/EU.

## DIGITAL TRANSFORMATION IN FOOD SMES: THE IMPACT ON BUSINESS MODEL INNOVATION AND INTERNATIONALISATION

Matarazzo, Michela<sup>1</sup>; Penco, Lara<sup>2</sup>; Profumo, Giorgia<sup>2</sup>

<sup>1</sup>DSEA, Guglielmo Marconi University, Rome, Italy

<sup>2</sup>DIEC, University of Genoa, Genova, Italy

### ABSTRACT

The present study examines the impact of digital transformation on business model innovation (with a focus on the customer value creation and co-creation) and internationalization in the context of small and medium-sized firms (SMEs) operating in the food industry. The study tries to answer the following research questions: 1) How is the digital transformation changing the consumer value creation and the co-creation process of SMEs operating in the food industry? 2) How is the digital transformation changing the internationalisation strategies of SMEs operating in the food industry? To answer these research questions, we present a multiple case study research on the digital transformation of three Italian food SMEs. We found that for all the selected SMEs digital instruments contribute to innovate their business model, creating new distribution channels and new ways to create (co-create) and deliver value to customer segments; moreover, the use in particular of social media becomes one of the most important drivers and the “prerequisite” for internationalisation. Our study contributes to the existing literature on business model and digital transformation for this type of SMEs, providing also insights for the internationalisation literature. In addition to the theoretical implications, this study provides some managerial implications to accomplish the digital transformation of SMEs operating in the food industry.

*Keywords: digital transformation, internationalization, food industry.*

### INTRODUCTION

In recent years, digital transformation is revolutionizing the way companies carry out their business, creating relationships with consumers, suppliers and other actors (Bresciani et al., 2018; Scuotto et al., 2019), and fostering business model innovation and internationalization processes. Digitalization is shaping the traditional interaction between consumers and businesses (Taiminen and Karjaluoto, 2014). In particular, consumers have access to dozens of media channels with whom they may actively and effortlessly communicate with firms and other consumers, and pass through rapidly increasing number of touchpoints in their customer journey, many of which are digital (Verhoef et al., 2019).

Extant literature has traditionally explored the implementation of digital technologies in large corporations (Cenamor et al., 2019) or in particularly innovative businesses, digital start-ups and high-tech giants (Ghiezzi and Cavallo, 2019), while specific studies focused on entrepreneurial SMEs operating in traditional industries are relatively scarce, nevertheless this type of firm is recognized as innovative and a contributor to economic growth in many countries (for instance: Scuotto et al., 2017; Li et al. 2017). However, to the best of our knowledge, understanding how entrepreneurial SMEs utilize new digital tools in order to “shape” the process of customer value creation and co-creation both in domestic and international contexts requires more in-depth investigation.

Hence, to fill the literature gap, we ask: How the digital transformation is changing the consumer value creation and the co-creation process of entrepreneurial/family SMEs operating in the food industry? And How the digital transformation is changing the internationalization strategies of SMEs operating in the food industry?

To answer these research questions, we present a multiple case study research on the digital transformation of three food SMEs. The choice of the food industry is related to the fact that it is experiencing increasing changes with growing pressures from consumers (Vrontis et al., 2016; Bresciani, 2017). Food firms are facing new challenges, such as the increasing competition and the establishment of new disruptive technologies, such as IoT and big data (Franceschelli et al. 2018).

The remainder of this paper is organised as follows. Section Two provides the theoretical framework useful to carry out the explorative research by addressing the extant literature on digitalisation, business model and internationalisation. Section Three explains the research design and method. Section Four describes the major empirical findings of the analysis and presents the principal outcomes. Finally, Section Five discusses the academic and practical implications, together with the concluding remarks.

## LITERATURE REVIEW

### *Digital transformation and business model*

Digital transformation has received an increasing attention over the last two decades (Cha et al., 2015; Warner and Wager, 2019; Rachinger et al. 2018; Morakanyane et al., 2017). Analysing the evolution of the digital technologies for firm’s strategies, innovation and business model, at the beginning, companies were mostly involved in the application of internal management information systems such as Enterprise Resource Planning or Customer Relationship Management (Boersma and Kingma, 2005). In recent years, new digital technologies, such as big data, artificial intelligence, 4.0 machines, are revolutionizing the “way companies do business” (Rothberg and Erickson, 2017).

However, digital technologies may enhance not only operational efficiency by optimizing process management, but also market orientation through advanced market knowledge (Cenamora et al., 2019). Companies are focused on the application of cross-boundary digital technologies (Li et al., 2017), aimed at transforming the way organizations create value and the way organizations and consumers interact and exchange value (Yadav and Pavlou, 2014). Digital technologies, in fact, improve communication with customers (existing and potential) enabling their requirements to be better understood and facilitating customized offerings and new products tailored on the specific needs of customers (Barnes et al., 2012).

Within the business model (BM) framework, literature has found that digitalisation modifies the entire structure of business models and the value architecture of a business (Volberda et al., 2017; Saebi et al., 2017). This is true not only in high tech and digital industries but also in the traditional ones (Ferraris et al., 2018; Warner and Wäger, 2019)

Several studies have also found that digitalization can influence and innovate BM in three different ways: optimization of the existing BM (e.g. cost optimization); transformation of the existing BM (e.g. reconfiguration of existing models, extension of the established business); and development of a new BM (new customers, new products/services) (Rachinge et al., 2018). Arnold et al. (2016) argue that BM changes can be differentiated into BM development and BM innovation (BMI). In these perspective, digitalisation leads to a BMI, i.e. “the changes made in the business logic for creating and capturing value” (Bouwman et al., 2018, p. 107).

More specifically, we are interested in examining how digital technologies could lead to BMI (Bouwman et al., 2017), with particular regard how they affect the value proposition and customer relationships (Arnold et al., 2016). The “mobile revolution”, in fact, with the increasing power of social media and of analytics, has promote a digital transformation of the customer value creation (Rachinge et al., 2018): new apps, new services, new platforms, new data and new devices “have become a crowded play-ground for all kinds of companies that want to tap emerging chances” (Zott and Amit, 2017).

In this perspective, scholarly attention has delved into the diffusion of digital technologies that are focused on the value proposition and customer relationships. In particular, social media (with the raising relevance of mobile devices) have radically created new ways of interacting (Taiminen and Karjaluoto, 2015), innovating the customer value propositions and organizing innovative delivery operations (Swani, et al., 2017). Augmented reality transforms how individuals interact with their physical environments (Ferreira et al., 2019), improving the hedonic value of experience (Kim and Forsythe, 2008) and providing users the ability to share their experiences on social networks (Muzellec

and O'Raghallaigh, 2018). In this scenario, also Big Data affect the marketing mix: product (Yadav and Pavlou, 2014).

#### *SMEs adoption of digital technologies throughout the overall customer lifecycle*

Social media and mobile applications have brought revolutionary new ways of implementing corporate brand communication strategies, encouraging interaction, participation, cooperation. They stimulate continuous dialogue with customers, influencing brand meanings and messages, and dictating product or service developments. Social media involves users generating content and connecting with people through a many-to-many, rather than the traditional "one-to-many", communication approach allowing customers create and be active participants in the process. Some authors (Sawhney et al., 2005) have already showed multitude of innovative, real-time technologies as central to develop dialogue with customers throughout the customer journey and to influence one's overall brand preference (Baxendale et al, 2015; Lemon and Verhoef, 2016).

Owed to the evolution of the consumer journey, that is expected to grow further, SMEs have to change their marketing practices by increasingly utilizing technological touch-points as main elements in their marketing communications and interactions in order to increase loyalty amongst current consumers and allows them to publicly advocate the brand.

SMEs have the chance to interact with their customers at any stages from the buying decision process to the post-consumption process by exhibiting their services and benefits in an entertaining, non-intrusive manner, engage with consumers in a user-friendly and enjoyable environment (Clatworthy, 2012).

Sashi (2012) proposes a customer engagement framework that establishes the unique role played by social platforms at different stages of the relationship life cycle, from pre-sales information to post-purchase dialogue: from creation of experiential value for consumers, increasing their interaction and their willingness to purchase a given brand to customer satisfaction and customer engagement.

Customer's highly positive emotions during the customer's journey and over time drive to brand advocacy (the interaction with others in their social networks to spread the word about their positive experiences with a product, brand, or company) and engagement (the inclusion of customers in the value co-creation) enhancing satisfaction of the needs of customers as well as firm, since they become fans in interactions with other current or potential customers.

#### *Digital technologies and SMEs internationalization*

Some scholars (Etemad et al., 2010) introduce the term "internetization" to refer to the process of increasing adoption, diffusion, and deployment of internet-based technologies and processes that increasingly serve as the back bone of internationalization, especially in the SMEs.

Increased use and investments in digital technologies lead to higher degrees of internationalization and growth (Davis and Harveston, 2000). One of the reasons is that they can provide a way to decrease the effects of liability of foreignness and resource scarcity, and herewith contribute to increase speed of internationalization (Arenius et al., 2005) and to widen market opportunities.

The platforms may help to succeed in international expansion by enabling firms to obtain access to a wider network that provides millions of potential consumers and market knowledge. These platforms alleviate barriers to entry such as psychic distance and help firms with financial resource constraints build up brand awareness at relatively low cost.

Firms adopting an international approach could exploit global market opportunities more rapidly and obtain significant competitive advantage (Zhou et al., 2007). Social media platforms offer their own built-in analytical services such as Facebook Analytics, Twitter Analyser and YouTube Analytics which provide information on traffic and popularity such as the number of followers, likes, comments, etc. Other tools provided by search engines such as Google Analytics and Google Alerts can be used to analyze site traffic and the amount of times a brand, company or product has been mentioned (McCann and Barlow, 2015). These analytical services play a role of paramount importance in gaining data and information useful to better understand foreign consumers and markets (Ciravegna et al., 2014; Fernhaber and Li, 2013) and to develop superior marketing capabilities that are the prerequisite to succeed internationally.

## **METHODS**

The empirical data for this study were collected by applying a multiple case study approach (Yin, 1994; Cunningham, 1997; Eisenhardt and Graebner, 2007). We carried out several in-depth and semi-structured interviews based on face to face meetings using a semi-structured questionnaire, which allows for comparisons across the selected companies, as suggested by Massingham (2004). We interviewed entrepreneurs and managers responsible for corporate and business strategy and digitalization. In particular, the questionnaire was aimed at evaluating the digital transformation in terms of: i) digital tools and distribution channel for the customer value creation (or co-creation) (for instance, Sashi, 2012); ii) impact on the business model innovation (Zott et al., 2011); iii) impact on internationalization (Etemad et al., 2010); iv) leadership and major trigger of digital transformation (Teece, 2007).

In addition to primary data from interviews, secondary data from documents (such as business publications, corporate presentations, internet-based information, and newspapers) were gathered. We triangulated these data with the primary data, analysing the results and their coherence and reinforcing the knowledge of each company.

*Cases' selection and companies' profiles*

In line with the exploratory research purposes, the cases have been selected not because they are a representative sample in statistical terms but because they are considered able to provide significant insights concerning the relationship between the digitalisation and the business model transformation, with a focus on internationalization in the Italian food industry. Table 1 summarizes the research cases in terms of profile of the companies, strategies, channels and used digital tools.

*Fratelli Carli* is a company mainly focused on Olive Oil and Mediterranean specialities (such as preserves in oil and sauces). It was founded in 1911. Its strategy is characterised by segmenting the market using the distribution channel which is exclusively based on home delivery. The company seeks a differentiation advantage in terms of product quality and customer service. Investments in CRM and digital marketing tools has led to a better brand position. Over the years, Fratelli Carli has diversified its portfolio by adding the line of cosmetics (the “Mediterranea” brand) to the traditional oil and food specialities (the core business). This diversification strategy has been driven by synergies in sharing the same channel, logistics system and customer relationships database.

Table 1. Profiles and used digital tools of the selected companies

*De Matteis Agroalimentare* is a producer of durum wheat pasta founded in 1993 by two entrepreneurial families operating in the construction business for more than 50 years. Initially it was just a mill with a small pasta factory, which then became a world player in the pasta industry, with a very significant growth rate. De Matteis pasta company is one of the few in Italy with its own mill and an integrated wheat-pasta production chain. It has a control laboratory inside the mill in order to select the best wheat and making sure it meets strict standards of product quality. The premium brand of the company “pasta Armando” is only made of 100% Italian durum wheat from the “Armando” production chain based on an agreement with more than 1,500 farmers and 16,000 cultivated hectares. Oliviero is a confectionary producer based in Monteforte Irpino founded in 1910. Its strategy is based on a high differentiation with a wide assortment of Made in Italy products ranging from crumbly or soft nougat chocolate to Easter eggs, marrons glacés and cereal bars, also organic and gluten free. The company is oriented to high quality using first choice materials and to food safety

## MAIN RESULTS AND DISCUSSION

The studied SMEs are established in a mature industry (food) with “traditional ways of doing businesses”, but all the companies have set up a digital transformation process for shaping, in particular, the relationships with their customers, changing the traditional business model, as emerging from Table 2. First of all, digitalisation leads all the companies to an omnichannel distribution, merging the on-line and off-line environments. Digitalisation allows the consumer to integrate different distribution channels, enhancing the purchasing experience, adding information and stimulating conversations consumer-company and consumer-consumer at each stage of the consumer journey. The new business models are therefore primarily influenced by a changing in the distribution channels based on the website, e-commerce and social media. Fratelli Carli was born as a B2C company and since its origin it was characterized by direct marketing, selling via printed flier/catalogue or phone, and home delivery. In October 1996, Fratelli Carli decided to invest in e-commerce with its website (“*it was a natural evolution*”). In the last years, they have invested also in physical shops (flagship stores) in order to bring the product closer to the consumer. Moreover, Fratelli Carli is actually partner of some digital Marketplaces (e.g. Amazon), especially for the Mediterranean brand. All the distribution channels (mailing/phone + e-commerce + digital platforms + physical stores) are integrated in a holistic way, in order to enhance the number of touchpoints and to accomplish the consumer along her/his consumer journey. Thanks to the digitalisation, De Matteis could develop and strengthen a direct relationship both upstream with the farmers and downstream with the modern distribution channels. Particularly, they built with the most advanced retailers “*a shared database where to upload all the technical information on the products. There are some platforms where the data can be uploaded directly by the suppliers*”

*and we are reaching a whole integration: the ownership of the information is shared, involving a significant change in the processes".* Since the 85% of the De Matteis's turnover is made by export and the company is present in 45 countries, the possibility to create a strong partnership with the major grocery retailers abroad, allowed the company to consolidate its position in the foreign markets. In addition, despite De Matteis has not developed the Amazon channel on its own, its products are sold on Amazon by its business customers (*"you finish to sell on Amazon regardless your specific willingness to do it"*), thus inducing the management to think about the opportunity to consider this marketplace to increase the market share, especially for the products of the premium brand "pasta Armando".

Following Vial (2019), our results confirm that SMEs use digital technologies to change their distribution and sales channels. According to the extant literature (for instance: Ciravegna et al., 2014; Fernhaber and Li, 2013), digitalization supports the internationalization strategy: in particular, social media and e-commerce platforms are able to reach and entertain a dialogue with new consumers belonging to international countries, useful for understanding the opportunities emerging from the markets. As regards if and how the selected companies use digital instruments, we found very interesting results. All the companies employ different types of digital instruments oriented to various subjects (consumers, distributors, suppliers) and with diverse aims. De Matteis has developed a particular supplier-oriented App *"which has the objective to talk to a huge community of farmers in order to give them both agronomic and commercial information....We alternate this kind of information with marketing ones, focused on communication initiatives related to the brand Armando in order to keep the two worlds of production and distribution connected"*. With this tool, they can easily know what is available in stock, see their orders' history, download the official marketing material, and send after-sales requests.

QR-Code is used only by Fratelli Carli: the QR-Code is applied on each product and is considered an "electronic label", useful in the purchasing or post-purchasing phases, in terms of product information (i.e. characteristics, ingredients, nutrition elements), traceability and valorisation of the branded products for the costumers.

Table 2. *Business models changes and impact on the internationalisation strategies of the digital transformation*

Despite De Matteis acknowledges that the QR-Code would be a natural step for an integrated supply chain like that of pasta Armando, there are many technical problems related to the packaging that presents very high adjustment costs. Fratelli Carli recognizes that App and chatbot can create high potentials, but they are not endowed with them (*"it is not easy to keep alive an App for us"; "in the past, we had a Forum... at the moment the chatbot is not a priority; we prefer to use and select social media that are consistent with our target"*).

For all the companies, the most important benefits stemming from digital transformation seem to be related to the cross-valorisation of Social Media, CRM and Big Data Analytics. According to Taiminen and Karjaluoto (2015), the results confirm that social media have radically created new ways of interacting and are actually considered the most important mean of communication and value co-creation within the business model. The selected companies, in fact, invested in particular in Instagram and Facebook; these instruments are aimed at implementing and improving corporate brand communication strategies, encouraging interaction, participation and collaboration with consumers. Social media encompass social networking, blogging, influencers engagement to promote the brand, paid advertisements, video and photo virally spread. For De Matteis, social media are giving the great opportunity to directly keep in contact with consumers, because food is a traditional product that requires the involvement of an intermediary to be distributed to the end market. Social media are the appropriate response to the dynamic change that the food sector is experiencing, that is characterised by a new kind of consumer that wants to connect with the product in order to live a unique experience. *"In relation to this trend, we use social media to make consumers live our world throughout the recipes and the several ways of cooking our pasta"*. An important role is also played by the testimonial Alessandro Borghese, one of the most important Italian food influencer, with several hundred thousand followers on his social pages. In addition, social media are the tools to make the consumer understanding the whole integrated chain of pasta Armando and the backstage of the product, such as the food safety and the quality of the wheat. Regarding the international markets, the company uses the social media of its foreign business customers to promote its products to a specific market target, for example to reach consumers that live close to the supermarkets where the products are distributed. *"We did this kind of promotion with Delhaize chain in Belgium and in Spain, where we advertised some videos through the Facebook pages of the large-scale retailer"*. Social media are also useful for Big Data Analysis. The activity of reading the comments and the consumer behaviour on social media, help the companies to shape the value creation on the basis of consumers' profiles; also product innovation is tested using Big Data, without waiting for insights from traditional marketing researches; moreover, it is possible to apply dynamic pricing based on changing consumer demand and to create personal promotions. De Matteis is developing a project of Artificial Intelligence to forecast the demand in order to plan the industrial

activities and to provide the product when is needed and in the right quantities, avoiding broken stocks. The model is based on some algorithms using company's historical data combined with external databases. In the USA the company is going to study the seasonality of the pasta market, by linking it to some national celebrations to forecast demand peaks and declines. Not all the cases report a positive experience with the analysis of Big Data: Sovet is investing with and an external partner in CRM and Big Data Analysis, but at the moment the results are not satisfactory.

On the basis of the previous results, it emerges how digitalisation is the driver of the changing of the key components of the business model, also for companies operating in the traditional business, confirming Ferraris et al. (2018) and Warner and Wäger (2019). Moreover, according to Ashley and Tuten (2015), digital technologies help SMEs to overcome the disadvantage of small size, allowing to generate and communicate content and engage consumers, as well as to develop brand presence quickly and at a much lower cost than ever before. This is especially true for international markets, where digital instruments are becoming essential for: engaging new customers, creating relationships and brand affection, directly selling the products abroad and better understanding of consumers' needs and changing attitudes.

## CONCLUSION

This study scrutinizes how entrepreneurial/family SMEs operating in the food industry have changed their business models, in terms of processes of consumer value creation and co-creation, and internationalization paths as a result of the digital transformation.

We decided to focus only on the digital tools "demand side", neglecting the appliance of digital technologies to the "supply side" of the business model. The context of analysis is represented by SMEs operating in the Italian food industry.

From the analysis of three case studies, it emerges that the investigated entrepreneurial/family SMEs are inclined to use digital instruments both in the distribution, the communication and the market analysis phases, shaping their business models. In particular, digital instruments (e.g. social media, augmented reality, chatbot) help the firms to modify the process of consumer value creation, generating new distribution channels that are integrated in an omnichannel perspective, accomplishing deeper and new relationships with the existing consumers and enlarging the covered markets, also at international level. Therefore, digital transformation is considered the first driver and the condition sine qua non for the internationalization strategy.

This study provides theoretical and practical implications. In terms of theoretical implications, first of all, this explorative study helps to enrich the business model and digital transformation literature for SMEs that is still a neglected area of research. Secondly, the focus on food enhances the knowledge

about the current application of digital marketing instruments for the business model innovation and internationalization of the firms operating in this mature traditional industry. Moreover, this research has significant managerial implications. Digital technologies help SMEs operating in traditional sectors, where firm's reputation, brand awareness and customer relationships are important competitive levers to reach success; the digital transformation is also a condition for internationalization, especially in B2C sectors where the brand awareness is crucial. In this vein, neglecting the digital instruments is very risky and may seriously compromise the survivorship of the firm.

Despite the importance of these empirical results and practical implications, this study presents some inherent limitations, which might be challenged in future research. First, the study is based on a multiple case study design that does not provide static generalizations, yet it offers a "stepping stone" to building new theory. In this sense, this study is a pilot study for other analyses. Further studies are needed to extend the number of case studies by including other types of SMEs. Second, the number of investigated variables could be expanded by adding other factors related to the digital transformation, such as the production/logistics (Industry 4.0) and the micro foundations of the organization (e.g HRM).

## BUSINESS DIPLOMACY: AN INEVITABLE REQUIREMENT FOR SUCCESSFUL INTERNATIONAL ENDEAVOURS

**Monteiro, Rui; Meneses, Raquel; Brito, Carlos**

Marketing and Strategy, University of Porto - Faculty of Economics, FEP, Porto, Portugal

### ABSTRACT

The purpose of this paper is to demonstrate the importance of Business Diplomacy in international business, namely how this strategic tool impacts on the overall operations of firms when doing business abroad. The methodology used is theoretical based on an historical, comprehensive and updated literature review, aimed to identify the effective intervention mechanisms that give basis to Business Diplomacy. The findings disclose a series of dimensions associated to Business Diplomacy, revealing a broad and strategic approach to managing foreign environments in all their scope (market and non-market actors), and at the same time the difference between Business Diplomacy and related concepts (ex: CSR), highlighting the effective add-value of this integrated approach. In this paper is clear the distinctive nature of this concept and its importance for firms to overcome the intrinsic challenges of doing business abroad, grounded on the concepts of co-evolution and shared value between the firm and its environment that characterizes the XXI century economy.

*Keywords: Business Diplomacy, International Business, Internationalization, Co-Evolution, Shared Value.*

### INTRODUCTION

One of the main challenges regarding International Business (IB), since the beginning of the work in this field (Kindleberger, 1969, Vernon, 1971) has been the study of theoretical frameworks and business practices that could help firms overcome the intrinsic challenges of doing business abroad (e.g., Hymer, 1976, Zaheer, 1995, etc.)

Internationalization models have also aim to reduce that inherent deficit associated to the foreignness status (Hadley and Wilson, 2003, Håkansson and Snehota, 1989, Johanson and Mattsson, 1988, Johanson and Vahlne, 1977, Johanson and Vahlne, 2009, Vahlne and Johanson, 2013, etc.)

In the meantime, studies in International Relations, concerning the field of Diplomacy, have been increasingly more related to economic issues (Economic/Commercial Diplomacy), and more recently to specific business practices of international firms, i.e., Business Diplomacy (Ruël and Wolters, 2016, Saner *et al.*, 2000, Steger, 2003, Yiu and Saner, 2017).

The relevance of Business Diplomacy (BD) can be in a way assessed following a special issue of the journal *Advanced Series in Management* of 2017 dedicated exclusively to this field entitled *International Business Diplomacy* (e.g., Marques, 2017, Sidibé, 2017, Windsor, 2017), where BD is portrayed as the “strategic management of interfaces between an enterprise and its external non-business counterparts that have an impact on its reputational capital and licence to operate (...) strengthen an enterprise’s ability to shape and influence its operational environment” (Yiu and Saner, 2017, p. 36).

The advent of this contemporary concept is based on the assumption, following the IB scenario where companies operate, that they cannot longer rely only on the best price or product in order to be successful, i.e., solely on market dimensions, they need to incorporate non-market dimensions in their overall strategy in order to be able to address the multiple elements that constitute the environment in which they operate and that increasingly affect their performance, thus the need for “their own representational mechanisms to manage the complex relationships that mark today’s global system” (Muldoon, 2005, p. 341), i.e., Business Diplomacy.

The MNC is therefore viewed as a global citizen, that needs to engage and manage all the actors that constitute and affect the environment in which it operates (that impacts on their overall performance), and through this way achieve its full potential, being this ability a central component of business management in the XXI century, where BD presents itself as the tool achieve this goal. Hence, the purpose of this paper is to demonstrate the importance of BD in international business, namely how this strategic tool impacts on the overall operations of firms when doing business abroad.

## **BUSINESS DIPLOMACY**

Although this field only began to be addressed at the academic level in the end of the 20<sup>th</sup> century, there are previous references to BD (Jackson, 1950, Herter, 1966) related to the new IB landscape after World War II, taking into account three major factors: the emergence of new state actors (e.g., processes of independence in Africa), increased international competition (Europe and Japan), and the end of the honeymoon phase that MNEs experienced from the early 1950s to the mid-1960s (Dunning and Lundan, 2008). Hence, the era of the footloose enterprise (Caves, 1996) was over, so there was a demand for “moving from business as usual to business with ethics, and from being a corporate raider to be a corporate resident” (Saner and Yiu, 2014, p. 313).

### *Concept*

Table 1: Definitions of Business Diplomacy

| Author(s)                               | Definition  |
|---|---|
| (Saner et al., 2000p, 85)               | "[I]nfluencing economic and social actors to create and seize new business opportunities; working with rule-making international bodies whose decisions affect international business; forestalling potential conflicts with stakeholders and minimizing political risks; and using multiple international forums and media channels to safeguard corporate image."   |
| (Steger, 2003, pp. 6-7)                 | "[A]n attempt to manage systematically and professionally the business environment in such a way as to ensure that 'business is done smoothly', basically with an unquestioned 'license to operate' and an interaction that leads to mutual adaptation between corporations and society."   |
| (Muldoon, 2005, p. 355)                 | "[Su]ccessfully managing complex interactions with governments, multilateral institutions, and global social movements."  |
| (Amann et al., 2007, p. 34)             | "[T]he attempt to manage the business environment systematically and professionally, to ensure that business is done smoothly, with an unquestioned license to operate and an interaction that leads to mutual adaptation between corporations and society in a sense of co-evolution."   |
| (Ordeix-Rigo and Duarte, 2009, p. 561)  | [T]he capability that some major transnational corporations develop to draft and implement their own programs, independent from the government's initiative, to pursue similar diplomatic aims.   |
| (Ruël, 2013, p. 41)                     | [T]he representation and communication activities deployed by international businesses with host government representatives and non-governmental representatives in order to establish and sustain a positive relationship to maintain legitimacy and a license to operate."  |
| (Saner and Yiu, 2014, p. 317)           | "[P]ertains to the management of interfaces between a MNE [Multinational Enterprise] and its external non-business counterparts (NGOs, CSOs, international organizations (IOs), national and local governments) that have an impact on the MNE's reputational capital and its ability to shape and influence its operational environment."  |
| (Søndergaard, 2014, p. 357)             | "[T]he ability to function effectively and simultaneously in a wide range of market conditions and to interact with external stakeholders such as governments, supranational institutions and global social movements."   |
| (Monteiro and Meneses, 2015, pp. 23-24) | [T]he actions (engage with multiple stakeholders, create long-term alliances, promote a triple bottom line business culture, uphold the corporate brand and reputation, increase transparency, act in international forums, etc.) undertaken by firms, when dealing with their surrounding environment (home and abroad), concerning multiple actors, market and non-market related, so as to overcome the intrinsic business constraints of doing business abroad, thus emerging as a strategic management mindset, in line with the overall strategy of the organisation, aiming for a win-win type of engagement." |
| (Alammar and Pauleen, 2016, p. 9)       | [T]he practice of establishing and maintaining positive relationships with internal and external business and non-business stakeholders, including employees, businesses, governments and civil society actors, to create and maintain legitimacy and a social licence to operate, create alliances, and shape and influence the environment."  |

Source: Adapted from Alammar (2018) and developed.

Nevertheless, some works in the 90s (e.g., Strange, 1992, Trice et al., 1995, London, 1999) it was only in the begging of the century with the seminal works of Saner *et al.* (2000) and Steger (2003) that BD gained a new breath (which continued and as grown ever since), portraying it, respectively, as a core competency for global companies, and as the strategy for a volatile and fragmented business environment. Table 1 presents the most relevant BD definitions.

Saner *et al.* (2000) states that for international businesses to improve their effectiveness they should develop their own form of diplomacy, as an integrated function inside the organization, in order to manage multiple stakeholders. As such BD is imperative to deal with foreign country expectations,

thus the need to “build bridges between core businesses and the complex political environments within which global firms conduct business” (Saner *et al.*, 2000, p. 80)

International businesses can prevent extra costs (e.g., settlements), lose business opportunities and market share (e.g., boycotts) and reputational capital (e.g., bad press), if firms are “equipped with adequate diplomatic know-how, political foresightedness and social competence” (Saner *et al.*, 2000, p. 82), i.e., BD.

According to this view BD is able to: create new business opportunities (e.g., through international agreements), help generate social capital (e.g., addressing host countries needs and expectations), and build relationships and social influence (e.g., through involvement in local communities) (Saner *et al.*, 2000).

Therefore, the goal of BD is “influencing economic and social actors to create and seize new business opportunities; working with rule-making international bodies whose decisions affect international business; forestalling potential conflicts with stakeholders and minimizing political risks; and using multiple international forums and media channels to safeguard corporate image and reputation” (Saner *et al.*, 2000, p. 85).

The other seminal work (Steger, 2003) states that BD is not about crisis management but about crises prevention, and that “companies are intertwined with surrounding society” (Steger, 2003, p. 6), i.e., the business environment (governments, international organizations, NGOs, investors, customers, retailers, employees, unions, communities, media, regulators, activists, etc.) that constitutes market and increasingly non-market forces.

Steger (2003) characterizes this scenario where businesses operate as a “goldfish bowl transparency” (p. 6), where perception is reality and if there is a problem anywhere in the world, it can have a global impact on the entire organization, being now the condition for international businesses to operate the need to have a “licence to operate” (Ibid, p. 7).

Amann *et al.* (2007) refers to BD as the need to “[T]he attempt to manage the business environment systematically and professionally, to ensure that business is done smoothly, with an unquestioned license to operate and an interaction that leads to mutual adaptation between corporations and society in a sense of co-evolution.” (Amann *et al.*, 2007, p. 34), with a mindset to detect and understand emerging issues, to look beyond the short-term profit and in a crisis prevention and not of a crisis management approach.

This concept of co-evolution is closely connected to another that is very aligned with grounded principles of BD that is *shared value*. Businesses are increasingly viewed as a major cause of social (ex: lower wages), environmental (ex: depletion of natural resources), and economic (ex: unemployment)

problems, perceived this way to prosper at the expenses of the community, being because of this the legitimacy of business more damaged today than ever before (Porter and Kramer, 2019).

A big part of the problem lies with companies themselves, which remained trapped in an outdated approach to value creation: optimizing short-term and financial performance vs a long-term and a sustainable growth, hence the need to bring “business and society back together” (Porter and Kramer, 2019, p. 328).

Porter and Kramer (2019, p.331) propose the principle of shared value, “policies and operating practices that enhance the competitiveness of a company while simultaneously advancing the economic and social conditions in the communities in which it operates” (Porter and Kramer, 2019, p. 331).

The above principle is one of the postulates of BD, “an interaction that leads to mutual adaptation between corporations and society” (Steger, 2003, p. 7), plus when is mentioned that firms “have failed to grasp the importance of the broader business environment surrounding their major operations” (Porter and Kramer, 2019, p. 332), this is also advocated by BD, “manage the business environment systematically and professionally, to ensure that business is done smoothly” (Amann *et al.*, 2007, p. 34).

The final goal of shared value is to generate a positive never-ending cycle of prosperity between the business and the community where is established, from whom it depends and affects/is affected, which implies a new rethinking about business propositions, for example, create innovative products that prudently increased access to home ownership vs supporting home ownership trough a fund financed by the firm (Porter and Kramer, 2019).

In sum (and again), shared value principles are closely connected to BD as the first states that its starting point is to “identify all the societal needs, benefits, and harms that are or could be embodied in the firm’s products” (Porter and Kramer, 2019, p. 335), and the second also advocates “influencing economic and social actors to create and seize new business opportunities” (Saner *et al.*, 2000, p. 85).

Another view of BD makes a direct correlation to the internationalization process, as an “activity of interaction with the external environment in favour of the interests of the company (...) privately and also at the government level (...) as the main focus for the company designing its internationalization through the initiation or increase of export of their products, promoting him in the midst of international trade” (Fuhr and Paixão, 2009, pp. 10-11).

The current size and complexity of MNCs, according to Sarfati (2009), should drive their focus beyond the market, hence they need to “coordinate its market objectives with its objectives in relation to governments and the organized society” (Sarfati, 2009, p.1), perceived this way BD as a “multinational strategy to deal with all global corporate stakeholders” (Ibid, p. 12), which should address four basic elements: market, government, society and information, regarding both primary (e.g., marketing and operations) and support activities (e.g., human resources and infrastructures).

According to the view of Ordeix-Rigo and Duarte (2009) MNCs need to secure through BD a “status that goes beyond a license to operate” (Ordeix-Rigo and Duarte, 2009, p. 555), a need to “show their citizenship and their responsibility toward society” (Ibid, p. 556), hence the need to actively engage with society, a role beyond the classic dimension of generating products/services, employment and wealth, by creating institutions (e.g., foundations), granting support (e.g., sponsoring local social projects), all of this in an osmosis way and not in a unilateral process of the corporation towards society.

The emphasis on reputation is also highlighted by Demirdjian (2007), stating that this dimension in today’s global society can make or break a business, thus it is imperative for corporations to engage in a strategy that comprises the demands of the multiple stakeholders that constitute the market and affect the bottom line of the firm in order to survive, separating from its country’s image and employing their own separate diplomacy (BD).

The importance of managers in BD is also crucial following the need for an “mediating conflicts and advancing business interest by negotiating and forging networking with key players in the global market including government officers, religious and labor leaders, and influential non-governmental organizations” (Ali, 2009, p. 258), being the position in the international stage of the CEO of large MNCs equivalent today (and sometimes ever greater) than some government officials.

Following a growing number of local and international NGOs, international businesses are due to face significant demands and expectations so if “equipped with adequate diplomatic know-how, political foresightedness and social competence” (Saner *et al.*, 2000, p. 82), i.e., BD, they are able to better manage conflicts such as the case of the Shell Oil conflict in Nigeria or the Chinese investment in Myanmar (Mogensen, 2017).

BD not about crisis management but about crisis prevention because it aims to secure, in an early stage of engagement that “companies are intertwined with surrounding society” (Steger, 2003, p. 6), i.e., the business environment (governments, international organizations, NGOs, investors, customers, retailers, employees, unions, communities, media, regulators, activists, etc.).

But BD is not only about crisis prevention or crisis management, it aims first and foremost to leverage the firm ability to create new business opportunities (through international public and private agreements), to create social capital (addressing host countries needs and expectations), build networks of relationships (government bodies, international rule makers, etc.), aiming to ensure a sustainable, positive-sum and long-term favourable external environment to operate.

The performance of the MNCs are today deeply related to the ability of managing its business environment, perceiving this way a new form of social contract regarding businesses vis-à-vis society,

hence the need for “their own representational mechanisms to manage the complex relationships that mark today’s global system” (Muldoon, 2005, p. 341).

The IB field since its origins is deeply related to the need of supporting firms overcome the intrinsic challenges of doing business abroad and the concept BD is rooted in that specific concern. The evolution of the MNC status in IB and consequently the need for a growing emphasis on relationships, promoted the emergence of the concept of BD, so both areas are strongly interconnected.

In sum, BD represents a strategic management tool that enables the firm to manage the external environment in which it operates, regarding multiple actors (market and non-market related), that increasingly affects its ability to conduct business abroad (and consequently its overall performance), so is clear the need and relevance for the corporation to be equipped with a tool that enables it to manage this multifaceted and international set of challenges.

#### *Intervention mechanisms*

Following the above characterization and scope of BD is now essential to detail the tool in practice, i.e., the specific management mechanisms underlined in this concept in order to further ahead assess in what extent those instruments are used and are relevant, when adopted by the firm to overcome, manage and/or minimize the challenges previously identified of the internationalization process, thus ultimately, its level of usefulness/impact on the performance of the firm.

The intervention mechanisms of BD are summarized in Table 2, being all of them tools under its perceived role and scope, based upon an extensive literature review (Monteiro and Meneses, 2015) were all this tools were associated to the concept of BD, i.e., what it advocates and incorporates, being this assortment of instruments the portrait, in all its extension, of the full scope and add value of an effective practice of BD.

Table 2: Business Diplomacy

| Intervention Mechanisms  |
|--|
| Act in international forums  |
| Create a positive environment about the business and its impact on society |
| Create social capital, accumulate contacts and build social influence      |
| Creating alliances with key players in the global marketplace              |
| Engage with multiple stakeholders  |
| Enhances the adaptation process to other cultures                          |
| Increase transparency of decision-making                                   |
| Leveraging capabilities through economic diplomacy                         |
| Negotiate, promote long-term commitments, aim for win-win situations       |
| Protect the corporate brand and reputation                                 |

|   |
|---|
| Support a triple bottom line business culture |
|---|

Source: Monteiro and Meneses (2015)

The mechanisms mentioned in Table 2, following past empirical studies (e.g., Monteiro and Meneses, 2015, Saner and Yiu, 2005), can be more or less present/relevant (and differ depending on the sector or the firm).

Based on the list presented in Table 2, we can compile the BD mechanisms in the following main groups/subjects, and then detail each of them in terms of the goals proposed: Act in International Forums and take advantage of Economic Diplomacy; Adopt a Triple Bottom Line culture; Create Social Capital and Increase Transparency; Engage with Multiple Stakeholders; Enhance Culture Adaptation; Establish Alliances and Integrate Networks; Protect the Corporate Brand/Reputation.

Act in International Forums, concerns the ability of the firm to be present/represented at supra-national forums, such as the specialized agencies of the United Nations (World Intellectual Property Organization, International Labour Organization, etc.), but also public-private initiatives such as the World Economic Forum (Davos), where many of the rules, standards, etc. of IB are forged (e.g., Saner and Yiu, 2005, Sarfati, 2007).

Hence, it is imperative for firms (ex: through national/regional associations) to be present and thus be able to participate and give their input concerning the framework in which they will operate, that will have a critical impact on their international business's activities and thus performance.

The above dynamic, if possible, should be aligned with the Economic Diplomacy of the home state of the firm, i.e., concerted positions (public and private) in terms of the agenda regarding supra-national decisions where the state plays a major role in defining IB rules and standards with other parties (other states or supra-national bodies). For example, at the EU level, in the most assorted number of subjects (taxes, health and safety, competition, etc.), that will have a direct impact on the firm IB activities (Monteiro and Meneses, 2015).

The following group of BD mechanisms, Triple Bottom Line, i.e., the need for the firm to go "beyond the traditional measures of profits, return on investment, and shareholder value to include environmental and social dimensions." (Slaper and Hall, 2011, p.4), is naturally integrated in this field because it entitles the same grounded principles of BD (e.g., Muldoon, 2005, Saner and Yiu, 2005).

The environmental and social dimension comprehends the need to incorporate in the overall business strategy issues such, at the environmental, air and water quality, energy consumption, natural resources, etc., and regarding the social dimension is about (at the community or region level) education, access to social resources, health and well-being, quality of life, etc. (Slaper and Hall, 2011), being this dimension aligned with the co-evolution concept mentioned above between business and society (Amann *et al.*, 2007).

Another BD mechanism group is the need to Create Social Capital and Increase Transparency, and regarding the first is about the need for the firm, through effective actions in the field (ex: establish a foundation, support a charity institution), to gain the trust and confidence of its stakeholders, and in that process, build social capital (credits) to better manage the situations that will come along concerning their doubts, fears, suspicious, etc. (e.g., Ali, 2009, Ordeix-Rigo and Duarte, 2009).

Regarding Increase Transparency concerns the importance for the firm to state its goals and road-map to achieve them, to be clear and open with all the stakeholders that will be affected (directly and indirectly) by the firm plan of action, otherwise it will be perceived (by default) as a position of misleading that will inevitably and with unforeseeable negative consequences will affect its overall performance following a negative reaction of its stakeholders (e.g., Ordeix-Rigo and Duarte, 2009, Steger, 2006).

One of the forms to increase transparency is to have in place a communication plan to address some basic questions/natural concerns of the local actors such as: who is this firm?, why is it here?, how its presence will affect my life and of the community?

Another BD mechanism group is the imperative need to Engage with Multiple Stakeholders, i.e., to build a stakeholder's map (business and non-business related) that directly and indirectly will be affected by the firm business activity, identifying their concerns and expectations, and based on that assessment, be proactive in engaging with them, aiming to generate the best possible operation environment for the firm to operate, that at the same time will not condition the full potential of the firm and have all the stakeholder's concerns and expectations addressed (e.g., Ali, 2009, Amann *et al.*, 2007).

The following mechanism of BD is Enhance Culture Adaptation, the need for the firm to take in consideration the culture were its conducting its business and that is crucial to adapt its positioning (Saner and Yiu, 2003), because it cannot simply replicate the approach from own cultural context to another, hence the need for adaptations, i.e., to tailor the response/message to the receiver in each case taking in consideration different cultural frameworks from one location/country to another (Hofstede, 1991). If the firm does not take this singularity in consideration it takes the risks of the message be misinterpreted and subsequently result in some sort of losses, jeopardizing this way the goal of a good relationship with all its stakeholders.

The following BD mechanism group is about Establishing Alliances and Integrate Networks, and regarding the first is about identifying and then establish key partnerships aiming a positive sum and long-term relationships, in order to more efficiently, take advantage of the existing structures/organizations (e.g., Muldoon, 2005, Watkins, 2007), being this dimension related to the concept mentioned above of shared value between (Porter and Kramer, 2019).

The need to Integrate Networks, i.e., the insidership status, is a key condition in order to prevent one of the key liabilities of the internationalization process (Liability of Outsidership), being the goal to have mutual benefit network relationships, alongside on the most add value condition of belonging to the network: to share and access knowledge of several parties that otherwise would take a long time and would be very expensive, and in some cases, even unreachable (e.g., Hohenthal *et al.*, 2014, Vahlne and Johanson, 2013).

The last BD mechanism group is Protect the Corporate Brand/Reputation, being this a growing challenge/risk for MNCs to manage due to condition mentioned before that businesses operate in a “goldfish bowl transparency” (Steger, 2003, p. 6), where the scrutiny is constant and able to be conducted by anyone (nevertheless a more professional approach by NGOs and Media at large). Hence the work, of decades sometimes, can vanish in a split second with a post on social media regarding a misconduct of the firm, anywhere and at any time in the world (e.g., Demirdjian, 2007, Eskew, 2006). Thus, in order to minimize these risks, is crucial for the firm to have in place strong and fast replay mechanisms to prevent this exposure and at the same time to react to campaigns that aim to jeopardize (unfairly) its brand and reputation.

In sum, BD embodies much more than first (wrong) perception of some new arrangement (old wine, new bottle) of stakeholder management. It embodies that dimension alongside others (cf. Table 2), being its distinctive attribute the proactive strategic management mindset in relation to all actors (related and on related to the market), at local, regional, national and supranational level (political, economic, social, etc.), aiming to secure (by adapting, changing, etc.) the best business environment framework where it operates, in order to reach its full potential, free from any sort or form of shackles that can prevent the firm of accomplishing its goals.

## CONCLUSION

Despite all the developments in the IB environment in the last decades and advances in the theoretical frameworks and business practices regarding the challenge of internationalization process, a condition remains unchanged: firms, when engaging with foreign markets, continue to face significant specific and inherent challenges (maybe even greater today than in the past).

IB today happens in a complex and global business environment, driven by globalization, but substantial differences remain (institutional frameworks, social conditions, cultural values, etc.), hence the advent of BD, that aims to ensure the best (sustainable and long-term) business framework in each and every geography where it conduct its business.

BD presents itself as a set of actions undertaken by firms, when dealing with their foreign surrounding environment, concerning multiple actors, market and non-market related, aiming to overcome the

intrinsic business constraints of doing business across the border, presenting thus as a strategic management mind-set.

In this paper is clear the distinctive nature of this concept and its importance for firms to overcome the intrinsic challenges of doing business abroad, grounded on the concepts of co-evolution and shared value between the firm and its environment that characterizes the XXI century economy.

In sum, the firm can no longer rely only on the best price or product in order to be successful, i.e., solely on market dimensions, they need to incorporate non-market dimensions in their overall strategy in order to be able to address the multiple actors that constitute the environment in which they operate and that increasingly affect their performance, thus the need for their own representational mechanisms: Business Diplomacy.

## BRAND LOVE, EWOM AND RELATIONSHIP MARKETING: AN EMPIRICAL STUDY

Moreira, Joana<sup>1</sup>; Rua, Orlando Lima<sup>2</sup>

<sup>1</sup>ISCAP/P.PORTO, Porto, Portugal

<sup>2</sup>CEOS.PP/ISCAP/P.PORTO, Porto, Portugal

### ABSTRACT

The main goal of this study is to analyze the impact of brand love in eWOM and relationship marketing using social media as an interaction tool. Due to the large competition in the nowadays market, business needs to bet on differentiation to influence the clients to choose their brand. Thus, the elaboration of this research was made a theoretical study of the existing literature about Relationship Marketing, Brand Love, eWOM and social media. The empirical study was made using MaduGYM as a case study through a quantitative approach. The research instrument used was a questionnaire that contained 33 questions with a Cronbach's alpha value of 0.925 the target audience were the customers of MaduGYM. Data were analyzed using the quantitative methodology of structural equations using Partial Least Squares. The results obtained by the research shows that in the perception of customers of the MaduGYM brand love can influence positively the eWOM and relationship marketing strategies using social media as an interaction tool.

*Keywords: Brand love, e-WOM, communication, relationship marketing, social media.*

### INTRODUCTION

This study aims to analyze the impact of brand love in eWOM and relationship marketing using social media as an interaction tool.

Authors as Gracia, Ariño, and Blasco (2013), Reichheld (2000), Sondoh (2007) and Wijwaya (2020) presented the importance of the concept of the brand, brand loyalty and brand equity in the Relationship Marketing, but as Carrol and Ahuvia (2006) defends, Brand Love is a presage of happiness for the brand, which means that exist many customers that are loyal to the brand but don't have a feeling of love for them. We can say that loyalty can be one of the results of love for the brand, but it is not exclusive. Having this in mind, it's proposed in this research to go further, and instead of studying the effect of brand loyalty and brand equity, study the impact of brand love on relationship marketing and how brand love may have result in brand trust and brand equity.

Clark and Melancon (2013), Filipek (2019), Lipsman (2011), Rozwell (2010) are some authors that studied the impact that concepts as word-of-mouth and social media has in the relationship marketing, with the increase of the utilization of the social media in the customers and organizations day-to-day, eWOM as the result of the junction between word-of-mouth and social media (Jeong & Koo, 2015) is an important concept to study for the development of relationship marketing strategies drive to the online impact using social media as a tool to this development.

An evidence-based approach is necessary to explain the way that E-WOM influences the ability of the customer to trust and be loyal to a company, developing a feeling of love for a brand. As a result of that commitment, dedicated customers can become increasingly spokesperson or brand representatives (Fullerton, 2005 apud Gonçalves, 2019) what makes a customer easier and cheaper to maintain. Batra, Ahuvia, & Bagozzi (2012) defends that brand love is more inclusive and can more easily predict brand loyalty and business outcomes.

Batra, Ahuvia, and Bagozzi (2012) defend that is needed more research about how the components already identified of brand love can interact between them, Wijawa et al. (2020) suggests the development of research involving marketing variables to identify the effects of relationship marketing on the long-term sustainability, Rodrigues (2012) identifies the need of the study of the impact of social media platforms as Facebook in other marketing fields, Erkan and Evans (2016) suggests the study of the eWOM impact in anonymous platforms directed to a group that includes people of different ages that can have a different perspective of the use of social media and Gracia et al. (2013) defends that is needed the development of more research focused in the study of the relation between eWOM and relationship marketing from a customer perspective to be able to identify the importance of virtual environments for the client.

Having in count the suggestions of the previously mentioned authors and the gaps founded in the previous literature was identified the following research question: *How brand love positive enhances the results of eWOM and relationship marketing?*

## **THEORETICAL FRAMEWORK**

### **Brand love**

The first step to understanding what is brand love and how it's a different concept from the other types of brand emotions is to understand the concept of love that costumers use when they say that is in love with a specific brand or product (Fehr, 2006; Shaver et al., 1987), for that, it will be defined the different types of brand emotions during this chapter, also it will be studied how they connect between them.

According to Schultz, Barnes, and Azzaro (2015), brands are the primary connectors between the customer and the organization and the key ingredient for developing successful relationships between them. The brand represents a guarantee of quality, origin, and performance, and therefore increases the perceived value of the consumer and reduces the risk and complexity that are integral to the purchase decision (Blackett, 2004).

Mindrut, Manolica, & Roman (2015), affirms that without the brand, the product or service loses some meaning because it cannot be associated with what affects the purchasing process. The most important marketing function is brand building, consumers are directly confronted with brand products, and purchase the product or service depends on that, and it's because of that marketing makes purchasing decisions much ahead of the actual exchange. A decision of purchase or not a product or service will be made by prior positioning of the product brand itself in the customer's mind (Bačevac et al., 2019).

#### Electronic word-of-mouth (eWOM)

Nowadays electronic word-of-mouth (eWOM) is considered an influential marketing instrument (Bickart & Schindler, 2001; Kumar & Benbasat, 2006; Zhang, Craciun, & Shin, 2010) and can be considered as the evolution of traditional word-of-mouth with the development of the online word. The junction between WOM communication and social media networks have "*altered this face-to-face communication into computer-mediated WOM communication*" (Jeong & Koo, 2015, p. 2).

Electronic Word-of-Mouth (eWOM) can be defined as any positive or negative communication or observation made by the customers, the potential, actual or former customers, about the elements of the brand, as the product and name of the company, which will be available in the social media where the individual persons and organizations can see (Hennig-Thurau et al., 2004, p 39) due to (1) an elevated quantity, (2) distribution, (3) perseverance and visibility, (4) anonymousness and duplicity, (5) prominence of attitude, and (6) public commitment (King et al., 2014). Hu and Ha (2015), categorize eWOM into four different categories based on the difference of functions and communication forums: (1) specialized eWOM - refers to customer reviews posted on the comparison-shopping or rating websites which do not engage in product selling, (2) affiliated eWOM - refers to customer reviews affiliated with retail websites, (3) social eWOM - indicating any information related to brands/products exchanged among the users of social networking sites and (4) miscellaneous eWOM - which includes brand/product information exchanged on other online social media platforms such as blogs and discussion boards.

The opinion of the consumers that usually manifest their opinions and reviews using eWOM is more likely to be taken into account by their pairs (Bhandari & Rodgers, 2018). because "a negative or

positive attitude toward the product or service will influence customers' future purchase intentions by allowing them to compare the product or service's actual performance with their expectations" (Yang, 2017). These costumers also gain confidence in their knowledge about the products which consequently allows them to make better and more informed purchases (Bronner & Hoog 2011; Cheng & Loi 2014; Goldsmith & Horowitz 2006; Hennig-Thurau & Walsh 2003). That is why most of the organizations use electronic word-of-mouth (eWOM) as a tool to simulate present and/or future sales, despite the difficulty of successfully manage and elevate costs (Elliott et al., 2012).

### *Relationship marketing*

Relationship marketing can be defined as a strategy to lure, recognize, maintain, and enhance customer relationships to create consumer value through marketing activities (Cheng & Lee, 2011; Wijaya et al., 2020) and also is the understanding that the company needs to improve business process, communication, technology, and human resources maintaining business strategy and costumers focus (Tjiptono et al., 2006). Thus, by increases success in marketing and its products and/or services and, consequently, achieving customer loyalty (Aroeira, Dantas & Gosling, 2016). Antunes and Rita (2008, in Mendes, 2019) present the following pillars for the creation of relationship marketing: (1) the relationship: marketing must be focused on creating, maintaining and developing customer relations, (2) the interactivity of the parties: the relationship between organization/customer for delivery and creation of both parties requires a strengthening of emotional ties, namely, the communication between the two and (3) the long term: to create, maintain, and develop the relationships of both is necessary time (time-space).

Engaging in a long-term relationship with customers, allows marketers to have a clear view of customer segmentation and therefore program differentiation to match the potential revenue with service offerings by decreasing customer defection rate. Learning more about customer's needs is essential to achieve better customization of products and services. Furthermore, establishing permanent relationships with customers can help organizations maintain customer retention - that is less costly than acquiring new ones - repetitive purchase behavior, loyalty programs focus on customer's that results in generating revenue for an extended period (Rust, Moorman & Dickson, 2002; Hennig-Thurau et al., 2006; NG, 2010).

In fact, according to Odabasi (2013), the advantages of relationship marketing can be summarized in three main variables that are used to measure company performance about the level of customer satisfaction: commitment, empathy, reciprocity, and trust: (a) the advantages resulted from close relations formed and carried out with costumers, (b) the advantages derived from the improvements

in customer satisfaction that could come out from the practice's relationship marketing and (c) financial benefits that relationship marketing can provide for organizations;

### *Hypotheses derivation*

Electronic word-of-mouth (eWOM) is considered an influential marketing instrument (Bickart & Schindler, 2001; Kumar & Benbasat, 2006; Zhang, Craciun, & Shin, 2010) because offers a way to identify consumers' needs and perceptions and even a cost-effective in a way to communicate with them (Nieto et al., 2014) by changing their costumers' behaviors. It's considered as an evolution of traditional word-of-mouth with the use of social media as an interaction tool. This happens because social media helps to influence more customers and allows unlimited interactions, given the customer the opportunity of becoming a co-creator of publicity and have the ability of reach a large number of customers and potential customers right away and having in count the interests of the customers (Filipek, 2019). Brand Love is defined as the level of emotional connection that a satisfied customer feels about the name or product of a specific brand (Ahuvia, 2005) and this can be developed through the use of eWOM strategies. The fact that Brand Love positively influences Word-of-Mouth shows that when a customer has an emotional connection to a brand, it is expected that they will pass on their experience positively (Carroll & Ahuvia, 2006). Thus, the first hypothesis is presented:

H1: Brand love has a positive impact on eWOM.

Relationship Marketing can be defined as the understanding of the client has a central element in the way companies run their business (Almeida & Pereira, 2014), and the retention and customer loyalty are an increasing priority for the companies. This leads the companies to invest in getting to know the customer better to conquer their loyalty (Palmatier, 2008). According to Carroll and Ahuvia (2006), Brand Love has a strong focus affective. Brand Love had an impact on consumer loyalty to the brand and in the will to pay a premium price for their products (Park, et al., 2006). Also, and as a result of that commitment, dedicated customers can become increasingly spokesperson or brand representatives (Fullterton, 2005). Thus, the second hypothesis is presented:

H2: Brand love has a positive impact on relationship marketing.

## **METHOD**

### *Data collection plan*

To be able to answer the proposed hypotheses the instruments of research chosen have as a base a methodology that the customers will be able to answer at distance and that possibility several persons answering at the same time. The solution obtained was the questionnaires structured in the online

platform Google Forms directed to the sample of customers of the gymnasium. It will be used scales to structure the questionnaire with 4 main groups: general information, brand love, eWOM, and social media and it will be shared in the Facebook platform used by the staff of the gymnasium and the customers.

The instrument chosen was the questionnaire survey, in the sense that no variable was manipulated and all data related to the variables were collected at the same time (Bryman & Cramer, 2012).

Thus, the main advantages pointed to this method are: 1) it allows the collection of large amounts of data, and, since they are standardized, it facilitates the comparison between them and 2) it allows the generalization of the sample results to the population. However, this method is not without its drawback: 1) weight and cost; 2) the superficiality of the answers due to the standardization of the questions; 3) individualization leads to a loss of social relationships among respondents; and 4) the difficulty in controlling the response time, which often admits delays in the investigation process (Campenhoudt & Quivy, 2008).

#### *Measures and instrument*

This study uses well-validated scales from previous studies to operationalize the key constructs and adapted them to the particular context of our empirical setting.

*Independent variable* – Brand love's construct was assessed by Carroll and Ahuvia's (2006) scale.

*Dependent variables* – (1) eWOM was measured using Gracia, Ariño & Blasco (2013) and Harrison-Walker (2001) scales. Concerning relationship marketing, commitment's dimension was measured by Meyer and Allen's (1997) scale, trust by Lopes and Nohara's (2009) scale, satisfaction by Aaker (1996), Oliver (2014) and Seithaml et al.'s (2014) scales and, finally, relationship by Reichheld and Sasser (1990), Hutz and Souza (1998), Kotler (2000), Sheth and Parvatiyar (2000) and Zineldin's (2006) scales.

The questionnaire is composed by 4 main groups and 33 closed questions where it measures the degree of love felt by brands through 33 questions, using a rating scale from 1 to 7 (1 – strongly disagree; 7 – strongly agree).

This survey was carried out through the Google Forms platform, an online platform that allows the preparation of documents, such as surveys, their sharing, and dissemination, as well as monitoring the evolution of the data. The survey was online from April 21, 2020, until May, 4, 2020.

## RESULTS

### *Partial least squares*

The structural equation model is designated as a multiple regression method to establish relationships between variables (Marôco, 2010), with a minimum relational value of 0.7 to ensure that it is greater than the error variance (Carmines & Zeller, 1979).

Through the stability and internal consistency based on Cronbach's alpha, the reliability of the variables used in the investigation is calculated, with a minimum required level of 0.7 (Nunnally, 1978; Chin, 2010).

In the present study, Cronbach's Alpha levels were reached between 0.880 and 0.941, as shown in Table 1, which is considered very good and excellent (Pestana & Gageiro, 2008).

| Constructs             | Cronbach' Alpha | p values |
|------------------------|-----------------|----------|
| Brand love             | .880            | .000     |
| Relationship marketing | .911            | .000     |
| eWOM                   | .941            | .000     |

Table 13. *Cronbach's alpha of multidimensional variables*

The reliability coefficient was also used to test construction validity (Chin, 1998). As can be seen in Table 2, using the parameters of Gefen & Straub (2005) that defend a minimum level of 0.6, the variables exponentially exceed the reference value.

| Constructs             | Composite reliability | p values |
|------------------------|-----------------------|----------|
| Brand love             | .933                  | .000     |
| Relationship marketing | .930                  | .000     |
| eWOM                   | .958                  | .000     |

Table 2. *Composed reliability of multidimensional variables ( $\rho_c$ )*

In this test, both the analysis of convergent validity is carried out, where the indicators represent only one construction (Reinartz et al., 2009), as well as the discriminant validity.

In the present research study, the method proposed by Fornell and Lacker (1981) was used, which proposes the use of the average variance extracted (AVE) with a minimum value of 0.5 to prove convergent validity. As it is possible to observe in the next table, only the positioning did not obtain the required value.

| Constructs             | AVE  | p values |
|------------------------|------|----------|
| Brand love             | .682 | .000     |
| Relationship marketing | .508 | .000     |
| eWOM                   | .849 | .000     |

Table 3. *Convergent validity of the model*

The discriminating validity is determined by construction and is related to the level at which it differs and stands out from the rest of the model's constructions, making it necessary therefore the lack of correlations with other latent variables.

It can be gauged through the principle that all cross loads cannot be higher than a load of each indicator. On the other hand, the Fornell – Larcker (1981) criterion defends that it must be AVE that must be superior to the variance between the constructions of the same model.

Referring to the separation of Chin's explanatory power (1998) between moderate and substantial, it is possible to observe in Table 4 that satisfactory results were obtained regarding the validity of discrimination and, consequently, that the constructions are significantly different.

| Fornell-Larcker Criterion | Brand love | Relationship marketing | eWOM |
|---------------------------|------------|------------------------|------|
| Brand love                | .826       |                        |      |
| Relationship marketing    | .717       | .713                   |      |
| eWOM                      | .681       | .585                   | .922 |

Table 4. *Discriminant validity of the model*

According to Table 5, only two hypotheses were not significant according to Chin (1998) who defend a minimum structural coefficient of 0.2. The bootstrapping technique was used to calculate the relative strength of each exogenous construction.

| Hypotheses       | Original Sample (O) | Sample Mean (M) | Standard Error (STERR) | T Statistics ( O/STERR ) | p values | Results   |
|------------------|---------------------|-----------------|------------------------|--------------------------|----------|-----------|
| H1: BL --> +RM   | .717                | .732            | .050                   | 14.355                   | .000*    | Supported |
| H2: BL --> +eWOM | .681                | .685            | .060                   | 11.322                   | .000*    | Supported |

Legend:

BL – Brand love; eWOM – Electronic word-of-mouth; RM – Relationship marketing.

\*  $p < 0.001$ .

\*\*  $p < 0.05$ .

Table 5. *Effects of path coefficients*

In the following figure, it is possible to observe the final structural research model, taking into account the direct effects.

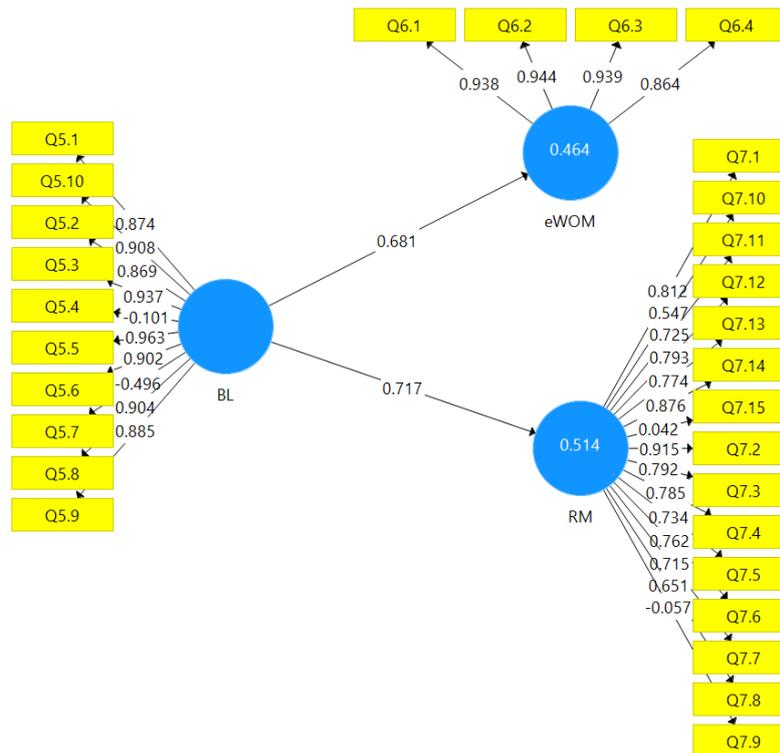

Figure 1. *Structural research model*

## DISCUSSION

The proposed operational research model included three constructs: (1) Brand love, (2) eWOM, and 3) Relationship marketing. The following hypotheses of the investigation were tested:

*H1: Brand love has a positive impact on eWOM.*

The results show the positive impact of brand love on eWOM and therefore this hypothesis is supported, to agree with the proposed studies (Carroll and Ahuvia, 2006; Filipek, 2019; Kudeshia et al., 2016). According to Carroll and Ahuvia (2006), Brand Love positively influences Word-of-Mouth which shows that when a customer has an emotional connection to a brand, it is expected that they will pass on their experience positively. With the use of social media as an interaction tool this transmission of satisfaction can influence more customers and allows unlimited interactions between the customers what shows to be an advantage for the organizations (Filipek, 2019). Also, according to Kudeshia et al. (2016), the relationship between brand love and eWOM has a strong positive connotation. This was supported by the results obtained through the data gathering which means that it's possible to confirm the veracity of the first hypothesis.

The hypothesis of being accepted demonstrates that companies can develop more efficient eWOM strategies if customers feel love for the brand.

*H2: Brand love has a positive impact on relationship marketing.*

The second hypothesis was validated to verify the influence of brand love in relationship marketing with the understanding of the customer as a central element in the way organizations run their business, this leads to the need to understand better the needs of the customers with the goal of conquest the love of the client, that will have an impact on the behavior of the client before the brand (Almeida and Pereira, 2014; Palmatier, 2008; Park, et al, 2006). However, it had a few studies that support the positive impact of Brand Love in Relationship Marketing, instead, the literature review for the impact of brand equity, brand loyalty and brand trust in relationship marketing are extensive (Aaker, 1996; Kanti, 2014; Reichheld, 1994; Rundle-Thiele et al., 2001; Sondoh et al., 2007; Wijawa, 2020) but as Batra, Ahuvia and Baggozi (2012) and Carroll and Ahuvia (2006) defends, brand love compared with other consumer brand relationship constructs, is more inclusive and can more easily predict brand loyalty and business outcomes, which leads to a better understanding by organizations, of the real needs of customers.

## CONCLUSIONS

Nowadays, there is an increasing interest in the subject and in the practice of physical activity that is increasingly part of the daily lives of individuals in our society. According to Calmeiro and Matos (2004), physical activity is considered a health behavior in which its regular practice is directly linked to the prevention of diseases, namely cardiovascular diseases, obesity, hypertension, diabetes, colon cancer, and osteoporosis. In fact, and according to the same authors, the practice of regular physical activity also presents psychological benefits in addition to physical ones, such as, for example, the reduction of the state of anxiety and mild depression, and its beneficial emotional effects are evident in all ages and genders.

In the digital environment it is possible to identify the existence of a fitness generation and a new trend in wellness. They are people who are concerned with body aesthetics, food, and mind. With the increase in the competitiveness of the fitness and wellness sector, the importance of devising strategies to avoid the loss of customers increases, since obtaining new customers causes high costs for companies. Their retention and loyalty may be essential at a financial level in the medium and long term for the company. With this increase in demand until today, it is up to the gyms and health clubs to adapt their responses with the objective of customer satisfaction, retention, and loyalty (Caldeira, 2006a).

To be able to achieve these goals, Brand Love, considered as the level of emotional connection that a satisfied customer feels about the name or product of a specific brand (Ahuvia, 2005) associated with

eWOM and relationship marketing strategies, allows organizations to act and respond in the best way to emerging issues such as customer satisfaction and loyalty.

Relationship marketing can be defined as a strategy to lure, recognize, *maintain, and enhance customer relationships to create consumer value through marketing activities* (Cheng & Lee, 2011 cited by Wijaya et al., 2020) and is the understanding that learning more about customer's needs, is essential to achieve better customization of products and services. The success of relationship marketing will make consumers trust in the organization. This condition encourages a good and loyal relationship between the organization and the customers (Wijawa et al., 2020). Electronic word-of-mouth (eWOM) is considered an influential marketing instrument (Bickart & Schindler, 2001; Kumar & Benbasat, 2006; Zhang, Craciun, & Shin, 2010) because offers a way to identify consumers' needs and perceptions and even a cost-effective in a way to communicate with them (Nieto et al., 2014) by changing their costumers' behaviors.

The eWOM and relational marketing strategies influenced by Brand Love can impact more customers if the organizations use Social Media as an interaction tool. This because it's used to build relationships with the consumers, create communities, distribute content, collect feedback from customers and support their brand (Michaelidou, Simagka, & Christodoulides, 2011) what helps to enhance the customer relationship. Unlike the traditional strategies of marketing, social media, allows unlimited interactions, given the customer the opportunity of becoming a co-creator of publicity and have the ability of reach a large number of customers and potential customers right away and having in count the interests of the customers (Filipek, 2019).

The quantitative study carried out during this work is limited to the study of a specific gym, MaduGYM to obtain a non-probabilistic sample for convenience. In this way, it was possible to analyze the impact of brand love on relationship marketing and eWOM strategies in this organization in particular.

Thus, we can identify the theoretical implication of this work as the validation of the importance of organizations keeping in mind the use of brand love, eWOM, and relationship marketing by supporting the previously developed literature and the results presented.

The implications that this study has brought to practice are the way the company will put into practice, marketing management strategies with customers as the target, keeping in mind the studied concepts of brand love, eWOM, and relationship marketing.

Some suggestions for the company will be to keep in mind a greater concern for customer loyalty that it already has instead of the concern of acquiring new customers. This way you will have more customers available to pay a premium price, and the customers will be the promoters of the company.

However, we can say that the limitations of this study are the sample size, the non-probable sample for convenience, the reduced time to develop the study due to meeting deadlines, and the little literature review found on the relationship of the study variables.

For future lines of investigation, I advise the application of this study in all gymnasiums to obtain a probabilistic sample.

Bearing in mind the scarce literature review on the subject, I advise the development of more studies related to other types of organizations, both in terms of services and products.

Over the past few decades, we have seen a variation in the needs and wants of customers, and even in the way the company relates to them. The formal and impersonal relationship was in the past, replaced by a more informal and personal relationship. To be able to apply the same, brand love, eWOM, and relationship marketing are current concepts that organizations must keep in mind to be able to keep up with the evolution of the times.

## CSR STRATEGIES AND STAKEHOLDER ENGAGEMENT IN ITALIAN FOOTBALL CLUBS

Mura, Rita; Vicentini, Francesca

Dep. of Movement, Human and Health Sciences, University of Rome "Foro Italico", Rome, Italy

### ABSTRACT

The paper aims to provide the groundwork for an investigation on corporate social responsibility (CSR) strategies in Italian Football clubs, focusing specifically on the kind of strategies they are implementing to engage with specific stakeholder groups. Accordingly, the purpose of the paper was to identify: 1) CSR implementation and communication strategies in Italian professional sport clubs; 2) the tools and methods used to engage with stakeholders.

We used qualitative and quantitative data on the CSR strategies and stakeholder engagement policies of 20 professional Italian football clubs that took part in the 2017-2018 and 2018-2019 seasons. We first analysed social engagement communication in general and successively investigated the implementation of associated actions. We collected data from the official websites of the clubs and from official reports' content analysis. The results confirmed previous studies (Picariello and Trendafilova, 2013) where it was argued that CSR policies in Serie A lacked a specific structure. In terms of implementation, we came across few and random social initiatives. CSR communication analysis was essential in identifying distinctive types of stakeholder engagement policies and practices. Although a large part of Italian football clubs continued to show unwillingness in adopting social policies, the few that set out CSR strategies and stakeholder engagement policies acknowledged the strategic and organizational relevance of such action, contributing to improving reputation as well as the trust of fans and other stakeholders. The study represents an initial overview of stakeholder engagement and communication in Italian professional sport.

*Keywords: Stakeholder engagement, CSR strategies, sports management, sports organization*

### INTRODUCTION

Our study aimed at providing the groundwork for the investigation of Corporate Social Responsibility (CSR) strategies in Italian Football clubs, specifically focusing on the kind of strategies that have been implemented to engage with specific categories of stakeholders. Accordingly, the purpose was to identify: 1) CSR implementation and communication strategies in Italian professional sport clubs; 2) the tools and methods used for stakeholder engagement.

There has been a growing interest for Corporate Social Responsibility (CSR) in the area of sports management (Godfrey *et al.*, 2009; Bradish and Cronin, 2009; Babiak and Wolfe, 2009; Paramio-Salcines *et al.*, 2013; Walzel and Robertson, 2016) due to its increasing importance for many sports clubs. Indeed, CSR has become essential for the enhancement and diffusion of brands (Blumrodt *et al.*, 2012; Hur *et al.*, 2014; Baena, 2018), and the development and strengthening of fan loyalty (Walters and Tacon, 2010), just to cite a few examples. A brief review of related literature suggested that CSR policies affected different areas and subjects. CSR activities benefitted internal organization, by developing a strong sense of community (Bradish and Cronin, 2009); the local communities, through direct engagement (Mynard *et al.*, 2009; Banda and Gultresa, 2015; Trendafilova *et al.*, 2014); the environment, by promoting the diffusion of environmental management initiatives (Babiak and Trendafilova, 2011; Trendafilova *et al.*, 2014; McCullough and Kellison, 2016); governance, by adopting CSR tools aimed at promoting accountability and transparency (Senaux, 2008; Hamil *et al.*, 2010; Walters and Hamil, 2013; Kolyperas *et al.*, 2015). Literature showed that CSR was strictly related to how an organization interacted with a wide range of stakeholders (Carroll, 1991; Wood, 2010). Consequently, a key consideration in the context of CSR was understanding how to manage stakeholders and engage with them.

## **CSR AND STAKEHOLDER ENGAGEMENT IN SPORTS ORGANIZATIONS AND FOOTBALL CLUBS**

Dealing with CSR issues has become an essential requirement for sports organizations. Most sports clubs that focused on CSR matters – those that were to some extent more diligent and foresighted – eventually adopted specific CSR strategies and policies.

CSR and stakeholder management were considered as strictly associated to each other. Stakeholder identification, engagement and involvement were identified as the three key aspects of stakeholder management (Low and Cowton, 2004). More specifically, stakeholder engagement mainly focused on how organizations communicated and entered into dialogue with stakeholder groups. Research showed this kind of engagement did not grant stakeholders decision-making powers. Stakeholders were not allowed to engage in any form of decision-making but only allowed to exert some form of influence on the organization.

Several studies focused on the relationship between stakeholders and social responsibility in sport organizations. For instance, Breitbarth and Harris (2008) analysed different types of sports organizations: professional football leagues and football clubs, sporting federations in England, Germany, Japan and the United States. The study highlighted a conceptual model to create value, financial, cultural, human (e.g., for NGOs), and in terms of reassurance (Breitbarth and Harris, 2008).

Walker and Kent (2009) showed the relationship between CSR and the fans' perception of its relevance. The conceptual model was based on four CSR issues: philanthropy, community engagement, youth education and health. Results showed how CSR affected reputation and fan consumer behaviour. CSR thus emerged as an integral part of the corporate mission and properly communicated. Previous studies analysed the concepts of corporate social responsibility, responsiveness and citizenship in relation with the activities reported by organizations in the sports industry. Walker and Parent (2010) analysed the websites of nearly 100 sport entities to provide both typicality and systematic variety of teams, leagues, and organizations to reveal general social involvement practices in the industry. They concluded that social involvement varied considerably in the sport industry and that such variation could be partially explained by geographical reach, stakeholder influences, and the business operations pursued by the organizations (Walker and Parent, 2010). Walker *et al.* (2010) highlighted the importance of the Internet as a new means for organizations to communicate with their stakeholders. For this reason, messages dedicated to ethical, environmental, and other social initiatives have increased in popularity. The study analysed CSR-related content distributed by teams to their stakeholders. Despite adopting different approaches to CSR, the results showed that many of the teams' communication strategies were similar in terms of content, self-reference, stakeholder issues and message orientation (Walker *et al.*, 2010).

More specifically, interest in CSR and stakeholder management within football clubs has grown rapidly in recent years. Most of the studies were dealt with British clubs (Michie and Oughton, 2005; Walters and Chadwick, 2009; Walters and Tacon, 2010; Walters, 2011; Healy and McDonagh, 2013; Morrow, 2013); French clubs (Cicut *et al.*, 2017; Senaux, 2004, 2008) and Turkish (Sarıkaya *et al.*, 2012) clubs; or on a wider selection of European (Walters and Tacon, 2013) or World clubs (Breitbarth and Harris, 2008). As Cicut *et al.* (2017) pointed out, several studies focused in identifying the clubs' stakeholder groups (Boon, 2000). Some scholars showed that key stakeholder groups defined the action of managers (Senaux, 2008). For this reason, researchers have focused their attention on the management of clubs either from the point of view of governance (Michie and Oughton, 2005) or, more specifically, by investigating specific stakeholders groups (Healy and McDonagh, 2013) or by dealing with a specific questions associated with social responsibility (Breitbarth and Harris, 2008; Walters and Chadwick, 2009; Walters and Tacon, 2010). Other research dealt with such topics as the construction of stadiums (Walters, 2011), market value volatility of clubs (Sarıkaya *et al.*, 2012) or information disclosure to stakeholders (Morrow, 2013). Walters and Tacon (2010) closely linked the concept of social responsibility to stakeholder management strategies in the UK football industry. The authors scrutinised the actions and responses of organizations as well as stakeholders, identifying the most important categories among them. A study on Charlton Athletic and Brentford revealed that the

football clubs by establishing a charitable structure involving socially responsible activities in the areas of health, education, social inclusion and community integration produced specific advantages, including the easing of community tensions, improved reputation management and brand building, besides a better relationship with the local authorities (Walters and Chadwick, 2009). This showed that football clubs could establish stronger commercial partnerships and stronger player identification through the implementation of citizenship-orientated activities by implementing a stakeholder engagement model based on the creation of a community trust model of governance.

In short, CSR research showed that sports clubs, especially football clubs, needed to expand the role of stakeholders in corporate CSR processes if they wanted to improve their efforts to build legitimacy, a positive reputation and lasting stakeholder relationships (Morsing and Schultz, 2006). Additionally, stakeholder engagement represented a way to improving the effectiveness of an organization and to creating (social) value.

## RESEARCH METHOD

Our study investigated how Italian Serie A football clubs implemented and communicated CSR policies and engaged with stakeholders (e.g., general public and fans), during the 2017-2018 and 2018-2019 seasons, by using the Francois *et al.* (2019) framework.

The 20 Serie A clubs were divided into four groups: alfa (A), beta (B), gamma (Γ) and delta (Δ). Clusters were set in relation to the average final positioning of each club in the last five seasons (from 2014-2015 to 2018-2019) and a score from 1 to 20 was assigned to each club. As reference, we considered the final position of clubs in each championship. These were added up and the result divided by the number of clubs participating in Serie A from the 2014-2015 to the 2018-2019 season. Final ranking was divided into four groups, each one consisting of five clubs:

- Group A: from the 1st to the 5th positions,
- Group B: from the 6th to the 10th positions,
- Group Γ: from the 11th to 15th positions,
- Group Δ: from the 16th to 20th positions.

The groups have been listed in Table 1.

| A                 |     | B              |     | Γ               |      | Δ                |       |
|-------------------|-----|----------------|-----|-----------------|------|------------------|-------|
| Juventus FC       | 1   | AC Milan       | 6.8 | US Sassuolo     | 10.4 | Cagliari Calcio  | 15    |
| Napoli SSC        | 2.8 | ACF Fiorentina | 8.2 | Bologna FC      | 13.5 | S.P.A.L.         | 15    |
| AS Roma           | 3.2 | US Sampdoria   | 8.2 | Genoa CFC       | 12.4 | Empoli FC        | 15.25 |
| FC Internazionale | 5.4 | Atalanta BC    | 8.8 | AS ChievoVerona | 14   | Parma Calcio     | 17    |
| SS Lazio          | 5.8 | Torino FC      | 9.2 | Udinese Calcio  | 14.4 | Frosinone Calcio | 19    |

Table 1. *Serie A clubs by groups and average positioning (from 2014-2015 to 2018-2019)*

### Data collection

Data was collected from the clubs' official websites (Breitbarth and Harris, 2008; Walker and Parent, 2010) in September and October 2019. In addition to the web sites, data was drawn from official reports' content analysis (sustainability reports, annual reports, strategic plans, CSR and social impact reports) published in the 2017-2018 and 2018-2019 seasons. An additional analysis was carried out by searching for specific key words ("CSR", "social responsibility", "social engagement", "sustainability") in the homepage.

#### *Data analysis*

A qualitative and a quantitative approach was carried out. In order to analyse the two dimensions of CSR (communication and implementation) and the tools and methods of stakeholder engagement, we adopted variables from previous studies (Francois *et al.*, 2019; Lindgreen and Swaen, 2010). We considered ten variables suggested by Francois *et al.* (2019) setting them out below in greater detail:

1. The choice of media clubs adopted to communicate their social engagement strategy to stakeholder group (e.g., fans and community). We distinguished between traditional media (web sites) and social media (in particular, Facebook and Twitter).
2. Reporting as a key tool of social responsibility communication (Idowu and Towler, 2004). We highlighted the presence of sustainability and CSR/ethics reports.
3. Vocabulary, distinguishing between "soft" and "hard" communication. Vocabulary, we recall, is considered "soft" when social policies are described employing terms relating to values and ethos. While communication is "hard" when "activities are presented as having clear objectives and described using terms relating to strategy" (Francois *et al.*, 2019).
4. Partner communication is on the other hand "strong" if a club regularly referred to partners involved in an initiative, while it is 'weak' when a club does not mention the involvement of partners.
5. Global CSR communication. According to a twofold concept of CSR, it can be "altruistic" or "strategic" (Porter and Kramer, 2006; Walker and Parent, 2010).

CSR implementation variables were the following:

1. Number of social initiatives. In line with recent studies (Rosca, 2011; Francois *et al.*, 2019), the variable aimed at quantifying the club's social activities through a rating scale. Our study used a scale that ranged from "few" to "many" (where "few" applied to the number of initiatives from 0 to 3, "moderate" from 4 to 5 and "many" from 6 and upwards).
2. Social engagement. The following categories of social activities were established specifically to sports (Walker and Kent, 2009; Walker and Parent, 2010): community investment, diversity, environment, health, philanthropy, youth education, other (Francois *et al.*, 2019).

3. Scope of social engagement. A distinction was made between local/national and international initiatives (Kolyperas and Sparks, 2011; Walker and Parent, 2010).
4. Means of delivery. The study showed whether clubs relied on external structures (e.g. foundations or, in Italy, so-called ONLUS) and internal resources (e.g. internal departments) to implement CSR (Kolyperas *et al.*, 2016).
5. Partner involvement. This variable was related to the degree of partners involvement in social policies (we used a rating scale from “weak” to “strong”) (Lindgreen and Swaen, 2010).

We defined the modalities contained in each of the variables in order to clarify the different situations that emerged. We sought to define ‘mutually exclusive modalities’ and ‘non-mutually exclusive’ modalities (Francois *et al.*, 2019). This solution allowed us to code these modalities and convert them from qualitative data into quantitative data.

## RESULTS

CSR communication results have been summarized in Table 2. As for the media channels variable, dedicated tabs or menus were not available in nearly half the clubs (Fiorentina, Frosinone, Napoli, Parma, Sampdoria, S.P.A.L., Torino and Udinese). While all clubs have official websites, only three clubs (Internazionale, Milan and ChievoVerona) set up dedicated websites to promote and communicate CSR. Although, 100% of the clubs utilized social networks (Facebook, Twitter, Instagram, YouTube, etc.) to engage with their stakeholder (especially fans), only a few clubs (Roma, Bologna, Cagliari, ChievoVerona, Internazionale and Milan) relied on social networks (especially Facebook) to communicate their social initiatives. As for social/sustainability reporting, only Milan and Juventus published an annual sustainability report, in compliance with recent GRI Standard international guidelines (Global Reporting Initiative, 2016). Eleven clubs presented their ethical code on the website. Most clubs (7) adopted a “soft” vocabulary inspired by their value system; only three clubs (Genoa, Juventus and Milan) employed a “hard” vocabulary, presenting CSR policies with clear objectives and using specific terms relating to strategy. With regard to partner communication, seven out of twenty clubs systematically mentioned partners who took part in social activities (“weak” communication). Lastly, seven clubs adopted a “strategic” CSR policies (because their CSR supported the club’s core strategy), while five clubs developed “altruistic” CSR initiatives not linked to the club’s strategy.

|                          | A | %    | B | %   | Γ | %   | Δ | %   |

Table 2. Descriptive statistics for CSR communication in Serie A (divided into A, B, Γ e Δ groups)

In terms of implementation, CSR action was not clearly organized with initiatives being few and non-recurrent (Table 3). Eleven out of twenty clubs pursued community investment action; six clubs encouraged respect of diversity, while only two clubs endorsed environmental policies. Interestingly, the clubs' most widespread type of social engagement was "youth education", considering the importance of football among the younger age groups. While the scope of activities tended to be mostly local or national, four clubs also developed international social activities. Seven clubs established non-profit organizations (foundations and ONLUS) to deliver social initiatives, while five clubs established internal departments to this purpose. Finally, most of the clubs (55%) did not apply partner integration policies, while only four clubs involved (in a "strong" way) partners in their initiatives.

Table 3. Descriptive statistics for CSR implementation in Serie A (divided into A, B, Γ e Δ groups)

## DISCUSSION

Our results confirmed previous studies (Picariello and Trendafilova, 2013) which argued that CSR policies in Serie A lacked a specific structure.

Even if clubs in Group A (Table 1) (i.e. Juventus, Milan, Internazionale) were considered high-performing sports clubs, in our study this was not so closely connected to the results in terms of CSR activities and stakeholder engagement. The analysis of CSR communication was crucial in identifying distinctive types of stakeholder engagement policies and practices addressed to specific stakeholder groups. Public information on social media, CSR reports and websites in general addressed specific groups of stakeholders, namely the wider public, local communities and fans. While clubs acknowledged the importance to share sport (and corporate) information with stakeholders (e.g. sporting results and events, player information etc.) and engage with them through social networks, half of the clubs did not use any social network to communicate their specific social initiatives. Another form of social engagement analysed in this study was the use of reporting. In fact, only two clubs

published formal CSR or sustainability reports. According to scholars, social reporting was widely leveraged as a tool for stakeholder engagement. Social reporting in fact fostered accountability enabling external stakeholders to assess the club's performance. Another form of social reporting was represented by the ethical code (Caulfield, 2013), the document containing the principal statements of values that drive the club's operation, including corporate ethics, the rules of conduct employees are expected to follow and the corporate responsibility guidelines that govern relations with stakeholders. Although social reporting was considered an important tool of stakeholder engagement, in most cases the modes of communication were one-way, giving little chance for stakeholders to respond (Walters and Tacon, 2013). Clubs mostly provided "soft" communication, where initiatives were described using terms relating to the ethos and values of sport.

In terms of implementation, a key aspect of CSR was represented by club initiatives in predominantly local society. Atalanta B.C., for example, established the "Atalanta Fund" to finance social projects in its geographical area, while beneficiary of Genoa C.F.C.'s social responsibility action for the 2017-2018 season was the Gaslini Institute, the largest paediatric hospital in northern Italy. Napoli SSC, on the other hand, launched through "SSC Napoli Charity" a charitable program, which supported non-profit associations operating in the Campania region. A notable exception to this local focus of CSR was provided by Juventus, which for several years acted to foster integration and to combat discrimination in Africa (e.g. the project for the "Reintegration of Child Soldiers in Mali and Central African Republic"). Another example was represented by the activities carried out by "Inter Campus" on giving the "Right to Play" to thousands of less fortunate children since 1997. These approaches were essential in the stakeholder engagement process (Greenwood, 2007; Noland and Philips, 2010; O'Riordan and Faibrass, 2014) and went a long way in creating a trust-based relationship with the stakeholders.

Social engagement essentially focused on youth education, community investment, health, philanthropy (only two clubs endorsed environmental policies). It should be pointed out that all clubs pursued social activities in the area of youth education. This is very significant because it provided further proof of the role of sport, which more than any other potential vehicle, contains qualities that make it a powerful force in effecting positive social change (Smith and Westerbeek, 2007).

In considering the "means of delivery" of social initiatives, a heterogeneous framework emerged. For years, clubs have recorded successful experiences in CSR by leveraging either internal or external resources (e.g. foundations). For instance, Milan established the "Milan Foundation" in 2003 (a public charity linked to the wider scope of Gruppo Milan's Corporate Responsibility and Sustainability) with the aim of bringing about positive change in society and expressing solidarity to the more vulnerable segments of society. Another recent example was "Roma Cares," a non-profit organization established

by A.S. Roma in 2014 with the aim of promoting education and positive values in sport that was engaged in activities within local communities for the benefit above all of less affluent young people. The importance of such external charitable organizations was clarified in the Brown *et al.* (2006) study where the authors wrote: "Community departments at football clubs should seek to develop organizational and financial independence from their clubs. This will protect them from fluctuations in performance at clubs and provide them with freedom to develop their own ways of working." (Brown *et al.*, 2006).

## CONCLUSIONS AND PERSPECTIVES

The successful implementation of social policies (Chatzoglou *et al.*, 2017) can deliver several benefits for football clubs such as the development of long-term loyalty, legitimacy, trust and brand equity, which can contribute to the development of competitive advantage and improve financial performance (Walters and Chadwick, 2009). This paper represents an initial analysis on the implementation of CSR practices and stakeholder engagement tools in the sports industry by shedding more light on professional Italian football clubs.

Further detailed analysis could examine social engagement strategies carried out for specific stakeholder categories (e.g., sponsor or government). In addition, more detailed and transversal research should help to identify the organisational processes involved in CSR within sport.

# LITERATURE REVIEW ON THE DIFFERENCES IN KNOWLEDGE DEVELOPMENT BETWEEN FIRMS FROM EMERGING AND DEVELOPED MARKETS

Nelaeva, Alena; Nilssen, Frode

Nord University, Norway

## ABSTRACT

Literature regarding knowledge development during internationalization has been extensively advanced in the context of developed and more recently emerging markets. However, this literature is fragmented, which hinders ability to compare challenges of knowledge development for firms from different contexts. Therefore, in this literature review we focus on how firms from emerging markets acquire, absorb and use this knowledge, and how the same process happens for firms from developed countries. We assess and compare this literature in the leading international business, management, marketing, and strategy journals during the past decade. The results from 52 reviewed papers indicate that there are significant differences in knowledge development strategies of firms from different contexts. The reason is that firms initially start internationalization with different amount of knowledge due to specifics of national contexts and the position of firms in international arena. We summarize how acquired knowledge influences further strategic decisions of firms during internationalization and offer several avenues for further research in the field.

*Keywords: knowledge development, organizational learning, literature review, emerging markets, developed markets*

## INTRODUCTION

Knowledge development is a key process for successful internationalization, during which firms gradually search, acquire, integrate and use knowledge about foreign markets (Johanson & Vahlne, 1977). The rich body of literature which explores the ways in which firms learn about new markets can be broadly divided to the following streams: (a) knowledge search and acquisition, for example through foreign direct investments (FDI), international joint ventures (IJV) or partnerships (e.g. Li *et al.*, 2015; Park & Harris, 2014); and (b) the ways of applying the acquired knowledge, which are usually presented with the absorptive capacity perspective and argue about difficulties firms face

with transferring knowledge between companies, subsidiaries, and countries, and using it inside the company (e.g. Demir & Söderman, 2007). These literature streams are mostly advanced on examples of firms from developed markets (Burgess & Steenkamp, 2006). Only in the middle of 2000s, the number of studies made in emerging markets (EMs) started to increase (Paul & Benito, 2018).

There are evidences that the antecedents and processes of knowledge development are dependent on the national context of the organization (Meyer, 2007; Michailova & Hutchings, 2006), and we know that contexts of developed and emerging markets differ dramatically (Marquis & Raynard, 2015). Therefore, this paper rests on the thought that the same process of searching, acquiring, and absorbing knowledge differs significantly between firms from EMs and firms from developed markets. However, how it differs remains an open question, mainly because the two streams of the literature are fragmented from each other in a way that the theories and findings from developed markets are not fully generalizable to EMs context (Banerjee *et al.*, 2015), but also because nobody has attempted to compare the findings of the streams. Without understanding of how knowledge development happens for firms from different contexts, it is complicated to derive practical guidelines to help firms during this process and to understand important directions for further research.

Drawing on this reasoning, the present paper aims to systematize and compare literature on knowledge search, acquisition and its strategic use among firms that originate from two different contexts: EMs and developed countries. Therefore, following the main discussion of the field, we ask the following questions: (1) *how do firms from EMs search, absorb, and use knowledge about targeted markets, and how the same processes are done in firms from developed countries;* (2) *what is the difference between the processes and its outcomes in different contexts;* (3) *how could the knowledge development literature be further advanced.* To pursue our goal, we make a systematic review (Tranfield *et al.*, 2003) of 52 articles from leading international business journals for the past decade.

This review offers in-depth analysis of what is known about knowledge development for firms from different contexts and suggests areas for future research by highlighting unanswered questions of the present knowledge. By this review we aim to advance international business literature by integrating and comparing two streams of research, fragmented from each other. We assume it will help to conceptualize the field and help future research to formulate more plausible research questions and models.

The remainder of the paper proceeds as follows. In the next part, we describe how we selected the articles for the review. Further, we present findings from the sample, by showing the scope, the main

theoretical concepts, and the variables of interest. We proceed with the discussion, where we give answers to the research questions. We conclude by giving our thoughts on possible avenues of further development of the field.

## METHODS

The schematic description of the methodological steps may be found in Appendix 1; below we describe each step in more detail. We show the nature of the review and the search protocol: reviewed journals, time span, inclusion criteria, and the selection process.

The aim of this review is to systematize and compare two fragmented streams of literature on knowledge search, acquisition and its strategic use. To ensure quality of the papers included into the review, we concentrated our search on the leading international business, marketing, management, and strategy journals: Journal of International Business Studies (JIBS), Strategic Management Journal (SMJ), Journal of World Business (JWB), International Business Review (IBR), Journal of Marketing (JMar), Journal of Marketing Research (JMR), Marketing Science (MS), European Journal of Marketing (EJM), Academy of Management Journal (AMJ), Academy of Management Review (AMR), Administrative Science Quarterly (ASQ), and Journal of Management (JMan). We do acknowledge that other related articles are published outside these journals. But these journals are considered to be the leading in the field and publish work that has the highest impact.

To be able to compare the two streams of research, we needed firstly to identify the relevant time span. In doing so, we relied on Paul and Benito (2018) in their note that EM firms rapidly increased the scale and pace of their business outside the home countries only in the beginning of 2000s, meaning that empirical research exploring EM firms appeared even further. We made a test search, which showed that only starting 2007 the number of articles made in EMs' context considerably increased. Therefore, the present review spans one decade, starting from 2007 until 2017.

Next, we identified the relevant keywords. We recognize that scholars use several terms to define EMs, thus we used the most common ones in our search: emerging, developing, and transition market/country. The rest of the keywords relate to knowledge development process during internationalization: international strategy, internationalization, knowledge development, and organizational learning. The keyword search in paper abstracts and titles using Web of Science database yielded 335 potentially relevant articles.

Studies eligible for review had to fulfill the following inclusion criteria. Firstly, it should clearly present one of the contexts: a) a firm from EMs internationalizing or already working in developed countries, or b) a firm from a developed country, which internationalizes, or already has businesses in EMs. Secondly, a paper should discuss and make conclusions related to aspects of knowledge development presented above. Thirdly, an article should have an empirical perspective, which means include data analysis and statistical tests.

To select relevant papers, we read the abstracts and in cases when it was not possible to judge about relevance after reading the abstract, we continued on the full paper to assess if it was appropriate for the review. Some articles clearly focused on aspects of knowledge development (e.g. Li *et al.*, 2015), while others explored different questions, however presented findings attributable to knowledge development process as an indirect outcome of the paper (e.g. García-Canal & Guillén, 2008; Gubbi *et al.*, 2010) Both types of papers were included into the review, because our aim was to find articles that present findings regarding knowledge development process. We excluded papers, which did not meet the inclusion criteria: the papers, which did not clearly presented the context (e.g. Bingham & Davis, 2012) and the papers that did not make any conclusions/discussion related to aspects of knowledge development (e.g. Chan *et al.*, 2010; Demirbag *et al.*, 2011; Heidenreich *et al.*, 2015; Lu & Ma, 2008). We as well excluded articles, which had state-owned enterprises or business groups as a unit of analysis because knowledge development process in such companies and private-owned firms differs significantly. Finally, 52 articles were included (the full list of included papers is available in Appendix 2) and its allocation among the journals is presented in table 1 (not including the journals where the search did not yield a result, as JMR, MS, EJM, AMR, JMan).

|           | JIBS | SMJ | JWB | IBR | AMJ | ASQ | JMark | Total |
|-----------|------|-----|-----|-----|-----|-----|-------|-------|
| 2007-2017 | 13   | 6   | 16  | 14  | 1   | 1   | 1     | 52    |

Table 1. Results of the search by journals

## SCOPE AND THE DESCRIPTION OF THE ARTICLES

### *The scope of the review*

Table 2 shows the regions and countries which were presented in the sample as well as the context of the articles. Some articles studied relationships between companies from two points of view (e.g. Banerjee *et al.*, 2015), thus there is a cross-posting in calculations.

Articles, which cover the first context, were more interested in questions of how firms from China (11 studies), India (5 studies) and other Southeast Asian countries internationalize to various developed countries. Indeed, India and China are the two most populated and fastest-growing countries in the region. Other countries did not receive much attention: two articles from Latin America, one from BRIC and Russia cannot shed light on patterns of learning and knowledge development in the regions. As we see, the articles usually did not specify targeted countries or studied multiple destinations. In the second context, many articles were focused on China as well, describing how firms from various developed countries do business there. Other Asian countries received smaller attention. Several articles were focused on countries from Central and Eastern Europe, which represent a very interesting region because of its Soviet past and rapid change to the market-based economy. If we analyze the papers' countries of origin, we see that the biggest part is done in the US (5 articles),

following Japan (4 articles), and Scandinavia (3 articles). In general, for the second context, the scope is more diverse and targeted countries are usually specified.

|                   |                   | 1st context: a firm from an EM internationalizing or already working in developed countries           |  |       |           |         |  |          |
|-------------------|-------------------|---|--|-------|-----------|---------|--|----------|
| Targeted country  | Initiator country | UK  | Scandinavian countries (Sweden, Denmark) | Japan | Australia | Germany | Not specified or multiple destinations |          |
| China             |                   |   | 1  |       | 1         | 1       | 8                                      |          |

Table 2. Regions/countries and contexts of the sample articles.

In total, the sample contains 27 articles made in the first context group, 18 articles made in the second context group, and 7 articles that develop conclusions for both contexts (for example as Yildiz and Fey (2016) discuss M&As between Sweden and China and give conclusions for both countries).

#### *Main theoretical concepts*

Scholars use many different theoretical perspectives and concepts to describe knowledge development process of firms internationalizing to host countries. Usually, they combine several perspectives from different fields to study this dynamic and complicated process. Often it is a perspective from organizational learning and institutional theory (hereinafter OL and IT respectively). It is quite expected because there are strong linkages between external institutions and the process of firm's learning, moreover it is argued that the three characteristics of institutions underpin OL (Levitt & March, 1988). There were many articles that do not distinguish a particular theoretical perspective, but relied on the current discussion in the related field (e.g. Elia & Santangelo, 2017; Xia *et al.*, 2009). The overview of the used theoretical perspectives is presented in table 3. Further below we describe each theoretical perspective in more detail and say how scholars use each of them separately, what questions they aim to answer, and what conclusions they find.

#### *Organizational learning theory*

OL is used in almost each study either as a major theoretical perspective or as an additional theoretical lens. Many scholars do not distinguish a certain perspective of OL in the articles; however, there are

several perspectives, which were in focus: 1) knowledge-based view; 2) LLL (linkage, leverage, and learning); 3) experiential learning; 4) catch-up strategies; and 5) absorptive capacity.

*Knowledge-based view* (KBV) has a very broad theoretical span and studies different types of knowledge and capabilities of a firm, which help to gain, absorb and integrate external knowledge to create competitive advantage and minimize future risks and uncertainties in foreign operations (Lu *et al.*, 2014). There are three papers in the sample, which explicitly stated the use of KBV. All of them study EMs context, covering such countries as Argentina (Corredoira & McDermott, 2014), Latin America in general (Dau, 2013), and China (Lu *et al.*, 2014). The papers are focused on studying the questions of how home institutions help/hinder firm's internationalization and how firms can learn from foreign MNEs. Scholars find that home government support, pro-market reforms, and well-developed host country institutions significantly reduce risk in international operations. They argue that for firms from EMs, it is important to acquire useful and transferable knowledge in their international operations because such knowledge can help them to build competitive advantage over their competitors at the home market.

| Theory                  | Perspective                           | The aim of the perspective  |
|-------------------------|---------------------------------------|---|
| Organizational learning | KBV (knowledge-based view)            | Studies different types of knowledge and capabilities of a firm, which help to gain, absorb and integrate external knowledge to create competitive advantage and minimize future risks and uncertainties in foreign operations. |
|                         | LLL (linkage, leverage, and learning) | Studies how firms internationalize by leveraging their resources, especially learning.  |
|                         | Experiential learning                 | The process of knowledge accumulation from previous experience and using it in future decisions.  |
|                         | Catch-up strategies                   | Asks how to utilize acquired knowledge to upgrade existing competencies and procedures.   |
|                         | Absorptive capacity                   | Studies how firms recognize the value of new, external information, assimilate and apply it to reach the organization's goals.  |
| Institutional theory    | Liability of foreignness              | Unfamiliarity with local culture and other aspects of local markets, lack of information, networks or political influence in the host country, which causes a competitive disadvantage for new entrants.                        |
|                         | Psychic/ cultural distance            | Factors, existing in the external environment (e.g., norms and values) that affect the perceptions of individuals.  |

|  |                      |   |
|--|----------------------|---|
|  | Institutional change | Change in the national environment of a country, which creates uncertainty and increases risks. |
|--|----------------------|---|

Table 3. Theoretical perspectives used in the sample articles

**Linkage, leverage, and learning** (LLL) model studies how firms internationalize by leveraging their resources, especially learning. LLL framework explains how firms that lack a strong resource base engage in rapid internationalization to get access to needed resources. Only three papers from EMs' context, one from China (Tan & Mathews, 2015) and two from India (Bangara *et al.*, 2012; Thite *et al.*, 2016), explicitly use LLL framework. Firms from EMs engage in linkage with players from developed markets via partnerships and acquisitions to get access to intangible resources, market opportunities, and management talent (Thite *et al.*, 2016). They leverage acquired knowledge to address firm-specific weaknesses and liabilities and learn from a more advanced partner (Tan & Mathews, 2015; Bangara *et al.*, 2012).

**Experiential learning** – a widely used perspective which study the process of knowledge accumulation from previous experience and using it in future decisions. Experiential learning is a first-hand, direct experience, gained from international operations (Tuschke *et al.*, 2014). The issues of experiential learning are more of focus in research made in a developed market context. Papers are focused on issues of learning in M&As and IJVs and when experiential learning and prior experience is more beneficial. Perkins (2014) shows that prior experience pays most consistently when the institutional environment of a new targeted country is similar to institutional environment of the country where the experience is from. Moreover, when firms try to apply irrelevant experience in a new country, the risk of failure increases, because managers overestimate performance outcomes. García-Canal and Guillén (2008) find that firms that originate from regulated industries accumulate their knowledge and skills to internationalize to politically unstable countries. Their previous experience of operating in politically unstable countries makes firms prone to use lobbying and bribing. It is also found, that political knowledge has a positive impact on competitive advantage for firms that work in EMs (Jiménez *et al.*, 2014), and a greater diversity of perceived political environments leads to a more positive attitude towards political risk. Another article shows that developed market firms with larger international experience tend to choose non-equity expansion modes when entering EMs because that way they can engage in experiential learning before making heavier investments (Wooster *et al.*, 2016). When comparing the usefulness of direct and indirect experience in the context of German FDIs to Eastern Europe, Tuschke *et al.* (2014) conclude that direct, first-hand experience is more beneficial with entries to EMs. In general, scholars from both contexts confirm that prior experience helps in international operations; however, firms from EMs are more

dependent on experience and are more sensitive to negative experience (Zhou *et al.*, 2016). Kim, Hoskisson, and Lee (2015) study Korean multinationals and show that it is better to internationalize to resource-poorer countries if a firm wants to take advantage of experiential learning efficiently. They also conclude that, nevertheless, expansion to developed countries brings needed market knowledge; learning is more complicated and takes longer time, due to other important constraints the firms need to deal with. Hong and Lee (2015) bring another perspective into the same context of Korean MNEs, arguing that experience reduces cultural uncertainty only when it is transferrable to other contexts. Thus, general knowledge is more efficient in international operations, because it is less country-specific.

Studies, which apply *catch-up strategies* do not use it as a standalone or a major perspective, but as an additional lens to ask how to utilize acquired knowledge to upgrade existing competencies and procedures (Lamin & Livanis, 2013). There are many reasons firms undertake catch-up strategies. For example, MNEs from EMs pursue strategic asset-seeking FDI to acquire knowledge-based resources like technology and managerial know-how, and catch-up with world leaders (Cui *et al.*, 2014). Also, headquarters from EMs want to have “reverse” knowledge flow from a subsidiary in a developed country with the aim of competence exploitation (Anderson *et al.*, 2015; Awate *et al.*, 2015). Catch-up helps to learn from observations and environmental scanning, thus it is the best strategy for firms that want to imitate easily observed technology (Lamin & Livanis, 2013). Four papers utilize catch-up perspective: two from EMs, and two that show perspective of firms from both types of markets.

*Absorptive capacity* is “a firm’s ability to recognize the value of new, external information, assimilate and apply it to reach the organization’s goals” (Cohen & Levinthal, 1990) and it is also called as knowledge transfer. There are many articles studying issues of absorptive capacity and knowledge transfer from both context groups. Scholars from EMs are interested in the following questions: how external forces (for example home country institutional conditions, psychic distance between countries, etc.) influence the efficiency of absorptive capacity (Corredoira & McDermott, 2014); what knowledge types are easier to absorb (Gunawan & Rose, 2014); what internal mechanisms a firm can develop to enhance absorptive capacity (B. I. Park & Choi, 2014); what personal qualities help managers to learn more efficiently (J.-Y. Park & Harris, 2014). Demir and Söderman (2007) explore Swedish JVs to China and ask how prior experience influences learning ability of a firm. Scholars from both contexts found several similar patterns. Firstly, home country institutional conditions may help or hinder absorptive capacity. For example, for Argentina, Corredoira and McDermott (2014) find that government support institutions, as public research institutes and training centers, facilitate learning and absorptive capacity of local firms. Local firms need these institutions to provide them with

valuable information, industry data, international trends and standards, which is complicated for firms to collect on their own. Secondly, specific internal organizational practices and managers' personal qualities may help to enhance absorptive capacity. Both J.-Y. Park and Harris (2014) and Demir and Söderman (2007) confirm that prior experience and knowledge from a specific host country enhances learning ability. Also, several articles studying cross-border acquisitions show that knowledge acquisition may be enhanced by open communication between the partners (B. I. Park & Choi, 2014), as well as by giving autonomy to a subsidiary (Wang *et al.*, 2014). Moreover, many authors find evidence that geographical distance negatively influences absorptive capacity; it was also confirmed for psychic distance (e.g. Yildiz & Fey, 2016). Gunawan and Rose (2014) found that for firms from EMs it was easier to absorb second-hand (indirect) knowledge, acquired from buyers, competitors, and the government.

#### *Institutional theory*

IT was not used as a one-standing perspective; it was always combined with some perspectives from OL. IT is helpful to shed light on questions of institutional differences between the home and host countries, institutional voids, cultural distance, etc. The combination with learning perspectives helps to trace dependence between knowledge development and institutional differences, which is crucial for studying such different contexts as developed and emerging countries. Below we outline the main theoretical lenses of IT used in the sample articles as well as scholars' claims and conclusions.

In general, scholars confirmed that distance between countries influence their propensity to learn: it is easier to learn for firms from geographically close countries, which share historical and social connections (B. I. Park & Choi, 2014); high differences in national and organizational cultures between partner firms hinders absorptive capacity (J.-Y. Park & Harris, 2014).

The biggest part of the articles addresses issues of *liability of foreignness* and *psychic distance* and asks how firms can overcome it. These questions were equally presented in both contexts. Liability of foreignness relates to unfamiliarity with local culture and other aspects of local markets, lack of information, networks or political influence in the host country, which causes a competitive disadvantage for new entrants (Lamin & Livanis, 2013). The finding, that foreign entrants tend to agglomerate to overcome liability of foreignness and get access to knowledge spillovers, is true for firms from both contexts (Lamin & Livanis, 2013; D. Tan & Meyer, 2011). Articles made in developed market context find that perception of differences motivates managers to learn about the culture and informal institutions (Abdi & Aulakh, 2012), the development of such market-specific knowledge further, decreases psychic distance (Dikova, 2009). Firms can get access to tacit knowledge as business

climate, culture, or structure of the market system, through partnerships and joint ventures with local firms, and use the partner's goodwill to overcome institutional distance (Owens *et al.*, 2013). Firms from EMs need a different type of knowledge to reduce cultural uncertainty – general international knowledge (Hong & Lee, 2015). Acquirers from EMs suffer from liability of foreignness and perception of psychic distance more than firms from developed countries (Zhou *et al.*, 2016). In partnerships between firms from emerging and developed markets, this asymmetry in perception of psychic distance may create divergent effects on knowledge transfer and organizational commitment. It happens because partners from EMs are more willing to implement organizational practices of the partner from a developed market, than vice versa (Yildiz & Fey, 2016). Firms from EMs can deal with this challenge and enhance inward learning by giving autonomy to the partner from a developed country (Liou *et al.*, 2016; Wang *et al.*, 2014). For example, they can mitigate liability of foreignness by sharing control with the local management and sharing work with local employees (Klossek *et al.*, 2012). Firms from developed markets also use the strategy of reduced organizational control, however with another aim: to minimize information and production costs by learning from their partners (Sartor & Beamish, 2014).

Another perspective of IT used in the sample is *institutional change* and its influence on entry strategies. This question was in focus for firms from developed markets that internationalize to EMs, which is not surprising since issues of institutional change are more relevant for unstable institutions of EMs (Rottig, 2016). Xia *et al.* (2009) find that when firms choose between a hierarchical and a less-involved entry (focused on building relationships, e.g., partnership) in countries with high uncertainty, more experienced firms tend to choose a hierarchical mode to get control, while firms that want to learn about the market, choose relational entry. This study focused on the behavior of firms from the US, going to Central and Eastern European (CEE) transition economies. Findings of another study, which was also made among firms from the US, but targeting Latin America and the Caribbean, contradict to the previous example. Wooster *et al.* (2016) give evidence that more experienced firms acknowledge the importance of market-specific knowledge and will choose a non-equity entry to engage in experiential learning prior to making heavier investments. This contradiction may be partly explained with findings from another study: Lahiri, Elango, and Kundu (2014) found that higher institutional distance forces firms to engage in full acquisitions. We wanted to check this argument and looked at Hofstede's cultural distance index to compare United States with some countries from CEE and Latin America regions. However, according to the indexes, it is impossible to judge that CEE countries are more culturally distant from the U.S. than Latin American countries ("Hofstede Insights - Country comparison,"). But we can assume then, that the U.S. based firms might perceive CEE countries as more distant, than Latin American countries.

We may summarize that scholars studying knowledge development of firms from EMs want to understand what types of knowledge and capabilities will help firms to minimize risks in foreign operations, how to offset their resource deficiency, and what strategies can help them to acquire knowledge from abroad and absorb it efficiently. Scholars from developed markets are interested in questions related to the development of international experience, what type of experience is more useful, what influences learning ability of a firm, and how to deal with institutional uncertainty of EMs.

The findings from the sample, allowed us to present a schematic description of the knowledge development process, and the strategies firms pursue in figure 1. We describe the points of the figure in more detail in the discussion part.

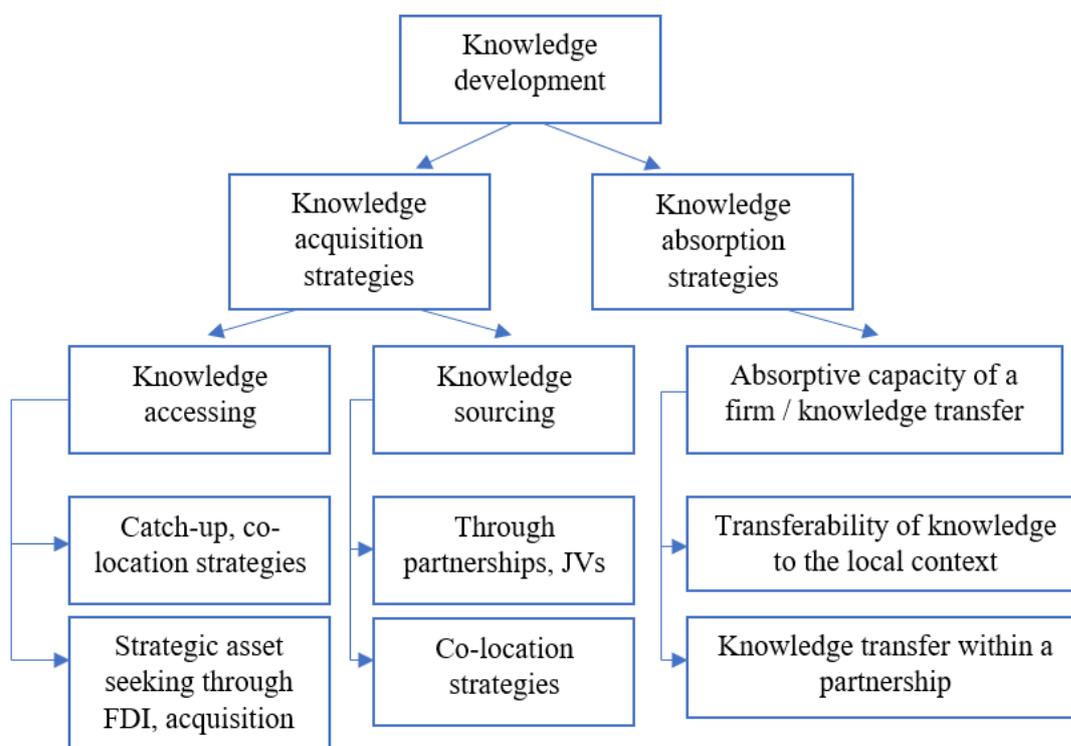

Figure 1. Schematic description of knowledge development strategies

## DISCUSSION AND FUTURE RESEARCH

In this paper, we aim to answer the questions of how organizations from different contexts acquire, absorb, and use knowledge about targeted markets and what outcomes this knowledge creates. The studied contexts are fundamentally different: the 1<sup>st</sup> context covers firms from EMs, which

internationalize or already work in developed countries, while the 2<sup>nd</sup> context embraces the opposite – firms from developed countries, starting or continuing business in EMs.

*What strategies do firms from EMs apply when search, absorb, and use knowledge about targeted markets, and what strategies are used by firms from developed countries?*

The literature about knowledge development process is quite diverse; however, we were able to distinguish two main strategies of knowledge development from the sample articles: a) knowledge acquiring strategies, and b) strategies of knowledge absorption.

#### *Knowledge acquiring strategies*

Firms undertake knowledge acquiring strategies to get tacit (D. Tan & Meyer, 2011), intangible, new-to-the industry (Levin & Barnard, 2013) knowledge and cutting-edge capabilities (Anderson *et al.*, 2015), which can be later used to get market access, upgrade firm's capabilities and practices (Gubbi *et al.*, 2010), and get competitive advantage at home market.

Scholars distinguish between “knowledge accessing” and “knowledge sourcing” strategies. To explain the difference between the strategies we may drive a parallel with Levinthal and March (1993), who discuss the difference between exploration and exploitation of knowledge. The authors write that exploration is the “pursuit of new knowledge”, while exploitation is the “use and development of things already known”. Sample articles use knowledge accessing concept when study behavior of firms from EMs, which internationalize to acquire new knowledge. Knowledge sourcing is used in the context of firms from developed countries, which go abroad to enhance their knowledge base with market-specific information.

a) As was said above, the term *knowledge accessing* is used in EMs context. The goal of this strategy is to have “reverse” knowledge flow, for example from subsidiaries, established in developed countries (Awate *et al.*, 2015). Firms from EMs use knowledge accessing strategy to catch-up with industry leaders and build competitive advantage. They pursue strategic asset-seeking to access tangible and intangible resources, including tacit knowledge and know-how, that are both difficult to trade through market transactions and take time to develop internally (Gubbi *et al.*, 2010). Firms use FDIs and acquisitions to have reverse knowledge transfer (Anderson *et al.*, 2015), to get access to best practices, to become more competitive and create firm-specific advantages (Cui *et al.*, 2014), and to compensate for the weak home country institutions (Elia & Santangelo, 2017). When EM firms are able to escape from the home country's unfavorable institutional environment and operate in more

efficient conditions, they can concentrate on building knowledge and developing their competencies (Deng, 2009).

b) Scholars studying firms from developed markets use *knowledge sourcing* term. Some papers describe it as a strategy of “teaching” firms’ subsidiaries in EMs (Awate *et al.*, 2015). When firms from developed countries internationalize to EMs, they need to adapt to local institutions. Thus, they prefer partnerships and joint ventures to acquire information about host country’s regulatory and social frameworks (Owens *et al.*, 2013) and to develop their internal organizational structure and capabilities topical in the targeted country (Abdi & Aulakh, 2012). Co-location with peers from the same country of origin helps to acquire tacit and sensitive information about the targeted market (D. Tan & Meyer, 2011).

From the above we see, that there are different types of knowledge that firms look for: new knowledge vs. additional, market-specific knowledge. This difference shows that firms from EMs initially lack knowledge, while firms from developed markets do not.

#### *Strategies of knowledge absorption*

We see that firms have different strategies for acquiring knowledge, depending on the country of origin, available resources, prior experience, and the type of information required. These aspects influence the next stage of the knowledge development process - transfer of the acquired knowledge to the company, its absorption inside the company and application in local conditions. Below we discuss which aspects influence knowledge transfer strategies in each context.

a) Issues of absorptive capacity are of high focus in articles made in EMs context. The high interest may demonstrate that it is more challenging for firms from EMs to transfer knowledge than to get access to it. There are many reasons why it is not so easy for firms from EMs to apply foreign knowledge at home. Many studies highlight issues of unpreparedness and lack of support from local institutions and organizations (e.g., local suppliers) (Corredoira & McDermott, 2014), lack of resources to apply new technologies and innovation. Thus the main feature of acquired knowledge should be its transferability to the local context (Dau, 2013). For firms from EMs, it is easier to absorb second-hand, and indirect knowledge, which they can get from the buyers in developed markets, and competitors (Gunawan & Rose, 2014). General international knowledge, which is easy to observe and copy, is more transferable between different contexts, which is why this type of knowledge is of focus among firms from EMs (Hong & Lee, 2015). The efficiency of the transfer also depends on the firm’s affiliation: whether it is a state-owned or a private firm. In EMs state-owned firms usually have better

political connections, which can help to benefit from collaboration with foreigners, but inhibit the ability to absorb foreign knowledge because of firm's hierarchical structure and organizational inertia (Chen & Tan, 2016). Conversely, private entrepreneurial firms have flexible organizational structures that foster learning culture, which makes acquired knowledge effective. To enhance absorptive capacity EM firms may hire "returnees", people who studied or worked in developed markets and have returned to the home country. These people possess valuable knowledge about regulations and traditions of host countries alongside with knowledge of home country norms, thus making the knowledge absorption process more effective.

b) There are only several studies, which address knowledge transfer issues in the context of firms from developed markets. However, they instantly show that the core of the challenges for knowledge transfer is different than for firms from EMs. Mostly, these papers study issues of knowledge transfer within a partnership. The papers show that developed countries have a higher status in the international arena, which is an advantage in many cases, but has important challenges when it comes to knowledge transfer. Perception of higher status causes overconfidence among managers and hinders the willingness to implement practices from "knowledge-inferior" partner (Yildiz & Fey, 2016), which may negatively influence the profitability of a partnership and lack of commitment. Institutional heterogeneity of EMs imposes additional challenges. Even geographically and culturally close EMs may significantly differ from each other, which creates issues with knowledge transfer. Acquisition of new market-specific knowledge is resource consuming. Moreover, even within-country regions may differ, which increases institutional hazards for firms from developed markets. In contrast, EM firms do not face this problem, because developed countries' institutional environments are more homogeneous.

*What is the difference between the strategies and its outcomes in different contexts?*

Based on the above, we see that firms from developed and EMs start internationalization with different knowledge base and experience. It goes along with the findings of Banerjee *et al.* (2015) who show that the stage and pattern of business evolution for firms from EMs differs significantly from the stage and pattern of firms from developed countries. When we compare the core questions and the findings of knowledge accessing vs. knowledge sourcing papers, we see that firms from EMs need novel knowledge, while firms from developed markets need to enhance already existing knowledge base. Firms from developed markets do business in EMs for many decades, which gave them "knowledge advantage". At first, it influences the type of information firms look for in international markets. To get general understanding about international markets, companies from EMs engage in

indirect learning and collect second-hand experience, which is easier to acquire and transfer to the home country. However, EM firms should be careful when choosing a source of information. For example, local suppliers in EMs have little international experience and cannot provide valid information (Gunawan & Rose, 2014). In contrast, compatriots, who work in developed countries, may give valuable novel knowledge (Levin & Barnard, 2013). Experienced firms from developed countries already possess general international experience from their predecessors, that is why they look for market-specific information for entering EMs and collect it through first-hand experience and experiential learning (Tuschke *et al.*, 2014). Local knowledge is important for EM firms as well, but during more “involved” types of entries, for example, FDI. Localized knowledge decreases uncertainty and is advantageous when MNEs are willing to overcome host regulatory uncertainty and achieve managerial efficiency (Fan *et al.*, 2016).

Companies engage in different entry modes due to different needed outcomes. Firms from EMs apply strategic asset seeking FDIs and acquisitions to acquire technologies and overcome the firms’ resource and home country’s disadvantages (Gubbi *et al.*, 2010). Firms from developed countries make acquisitions in EMs when it is possible to transfer their capabilities to the targeted firm and enhance innovation. The need for market-specific information influences their entry mode, thus these firms engage in partnerships more often.

The outcome and usefulness of the acquired knowledge mainly depend on the absorptive capacity of an organization. Firms from both contexts have its challenges with the effectiveness of knowledge transfer. Lack of support from home institutions forces firms from EMs to look for general knowledge, which does not provide any specific information about a country. If EM firms need more in-depth knowledge, e.g., technology or managerial capabilities, they prefer to enter the targeted country with an FDI or an acquisition. These modes are resource consuming, risky, and involve governing difficulties. Due to the liability of foreignness issues, EM firms give autonomy to their partners in developed markets, which increases the “reverse” knowledge flow, but decreases commitment and market presence. For firms from developed countries, the outcome is different. Higher international experience and status gives these firms initial competitive advantage and better position in a partnership. They do not need to pursue hierarchical modes of entry, since they are not interested in EMs’ technologies and know-how. Firms from developed countries prefer joint ventures and partnerships with locals to learn specific information about the market, its’ institutional arrangements, and ways of doing business. These modes of entry are less resource consuming and easier to govern, which makes learning more effective. The main aim is to “teach” knowledge-inferior partners to enhance innovation and profitability of the venture.

There is a very important difference in the perception of liability of foreignness by firms from different contexts, which influences their future strategic decisions. For firms from developed countries liability of foreignness appears as unfamiliarity with local procedures and culture. They may overcome it with specific entry strategies, like joint ventures, and modifications of organizational structures. The sample shows that firms from developed countries successfully apply these strategies. Firms from EMs perceive different aspects of liability of foreignness: lower status in the eyes of host country's customers and partners, and negative heritage associated with the home-country institutions. These issues are much more complicated to overcome, and the strategy of giving autonomy to the subsidiaries may help, but in the short-run. It may take a lot of time to build reputation and market presence.

*How could the knowledge development literature be further advanced?*

Based on the questions and findings of the sample articles, we propose the following avenues of further theoretical and methodological development.

We believe, the first issue that may help firms (especially from EMs) to strengthen their international positions is exploring *relationship between home country institutions and local organizations, and knowledge development*. Some papers are built on a claim that unpreparedness and underdevelopment of EMs' local institutions influences different aspects of the knowledge development process, including how firms acquire, absorb, and use knowledge. The main challenge for firms from EMs is to apply in local context knowledge gained from MNEs from developed countries (Corredoira & McDermott, 2014). Thus, for this knowledge to become useful and help firms to upgrade its capabilities and processes, they need support from local organizations and the government. Future research may look at this question more closely and discuss what particular institutions and organizations may enhance firms' absorptive capacity and how.

The questions of the role of local institutional environment in the knowledge acquiring process are of high importance. Reviewed papers showed that many EM firms try to overcome their "late-comers" disadvantage with hierarchical entry modes to directly acquire technologies and capabilities of firms from developed countries. However, hierarchical entry modes are risky and resource consuming, and require extensive market knowledge, which is complicated to collect on firms' own. It is important to understand whether certain organizations can help to decrease uncertainty by providing information, industry data, and standards of host markets. Is it also a matter of having a good network at home and the use of the firm's political capabilities? We believe, that the use of political strategies is a promising avenue in the international business research because both, emerging and developed countries are

becoming more and more politically regulated. Scholars claim that more diverse experience from different political environments leads to a more positive perception towards political risk and decreases uncertainty (Jiménez *et al.*, 2014). They emphasize the importance of framing political strategy as an opportunity to learn, rather than a threat. However, in China state-owned firms, in spite of having better political networks and thus better access to resources, have lower absorptive capacity due to organizational inertia (Chen & Tan, 2016). Thus, it is unclear what pros and cons political strategies have, and what are the determinants, measurement, and consequences of political capabilities in different contexts.

The next question, which was mentioned between the lines is: *are there types of knowledge and experience more beneficial/useful than others in different contexts*. Issues of applicability and transferability of knowledge to different countries were of researchers' interest in both contexts. Only one article found the clear distinction that general international experience (GIE) is more beneficial when a firm works in developed countries, and country-specific experience (CSE) is more useful in EMs (P.-Y. Li & Meyer, 2009). The authors make this conclusion in the context of Taiwanese subsidiaries working in emerging and developing countries, however, it is unclear whether this conclusion is universal. Are there types of GIE that is valuable in EMs, and CSE that is beneficial in developed markets? In addition P.-Y. Li and Meyer (2009) claim that GIE and CSE create different types of capabilities, which may have different impact on the firm's future strategy. However, it is unclear what types of capabilities and what is more useful in different countries. Scholars claim that developed markets are more institutionally homogeneous, thus knowledge and experience gained in one developed market is transferable to another developed market to some extent, while in EMs the situation is more complicated. But we know developed countries that are very different from each other, e.g. Israel and Norway, so will GIE work in both countries? Also maybe there are types of CSE that can work in many different markets? It is unclear are there other aspects inside or outside an organization that influence transferability of knowledge. In addition, articles, which discuss location strategies say that co-location enables firms to engage in observation and environmental scanning, and benefit from demonstration effects (Lamin & Livanis, 2013). They also say that in developed markets local firms do not pay much attention to location-specific activity, while in EMs locals actively agglomerate to get access to knowledge spillovers (D. Tan & Meyer, 2011). Does it mean that there is a difference between types and usefulness of knowledge spillovers in developed and emerging markets? In what way this knowledge may be used in future and how it influences liability of foreignness. Future research may look at these issues.

Issues of *managing international JVs and partnerships* are of high interest among the sample articles. Firms from both contexts use non-hierarchical entry modes to get access to tacit knowledge and technologies, learn the host market's norms and regulations. However, as we discussed above, there are many unanswered questions and challenges. For example, several articles discuss how firms from EMs use the strategy of giving autonomy to a subsidiary in a developed country to overcome different challenges. But these studies present autonomy delegation strategy only from the short-term point of view. Longitudinal studies can shed light on questions of the costs and benefits of the strategy in the long run, and how the strategy influences commitment and efficiency of a partnership over the years.

Other challenges arise from the *psychic and institutional distance between the parties and perceived liability of foreignness*. Scholars claim that high psychic and institutional distance hinders absorptive capacity and effectiveness of learning, and generates a lack of understanding between the partners (B. I. Park & Choi, 2014). Firms from high-status countries show unwillingness to implement organizational practices of the lower-status partner (Yildiz & Fey, 2016). However, we do not know what are the antecedents and long-term consequences of psychic distance and liability of foreignness perceptions, and what capabilities firms from low-status countries may develop to build legitimacy in a partnership.

There is a claim in the literature that firms from EMs do not follow internationally accepted internationalization model of gradual knowledge development (Johanson & Vahlne, 1977). We also noticed it in our sample, that firms from EMs often use involved, hierarchical internationalization modes to acquire knowledge and capabilities faster. Thus, we call for advancing the current theoretical perspectives and research models and frameworks to analyze knowledge acquisition strategies of firms from EMs. Since home country institutional environment plays an important role in firms' internationalization decisions (Scott, 2014), we assume that combination of several perspectives (e.g. perspectives from organizational learning and institutional theory) will add plausibility and robustness and enhance further theoretical development.

To enhance the reliability of the research, there is a need for greater geographical diversification of research settings. Most research from EMs was done in China and India, the countries which are institutionally and culturally different from other EMs, as Africa, Middle East, South America, and Eastern Europe. Studies showed that antecedents and outcomes of knowledge development process vary in different regions of the world. However, we do not know why it differs and how home country institutional conditions influence the process.

The major part of the papers used quantitative methods to achieve generalizability goals. However, by using quantitative methods, scholars ignore important features of qualitative research: in-depth understanding of a phenomenon and its antecedents and outcomes. Papers from the sample which did use a qualitative approach, made important conclusions, which were not possible to make using a quantitative approach. It is important to know about cases of failures because it may unfold a firm's internal capabilities and external triggers which prevent learning and lead to negative outcomes.

## CONCLUSIONS

In this review we compared two fragmented streams of literature on knowledge development during internationalization. Our focus has been on the processes of knowledge acquiring, absorption, and further use for firms from emerging and developed countries. We also highlighted unanswered questions in existing literature and suggested directions for further research to advance our knowledge on the field. A number of important conclusions are summarized here:

A firm's country of origin highly influences antecedents, strategies, and outcomes of the knowledge development process. Firms from developed countries have "knowledge advantage" and possess general knowledge about international markets derived from many decades of doing business abroad. It influences their strategies of acquiring knowledge and the type of knowledge that they need. Firms from EMs act as latecomers and are forced to apply more involved and risky internationalization strategies to develop their knowledge base faster and catch-up with the leaders. Due to local institutional conditions, it is harder for firms from EMs to absorb knowledge acquired in developed countries. Moreover, firms from EMs suffer from liability of foreignness to larger extent than firms from developed markets, due to lower status of their home countries.

## APPENDIX 1: METHODOLOGICAL PROTOCOL

1. The aim of the review: to systematize and compare literature on knowledge development (including knowledge search, acquisition, integration and strategic use) among firms that originate from two different contexts: from EMs and from developed countries.
2. Criteria for country allocation to an EM category or to a developed country:

The list of 64 emerging countries from Hoskisson, Eden, Lau, and Wright (2000). As the authors summarized, to be included into the “emerging” category, a country should address the following criteria: legal and governmental institutions in a country are underdeveloped and less market-supporting comparing with North America and Europe, and the level of income is middle with a high level of GDP. In total, 64 countries were classified as EMs. Despite some of the countries has evolved from the “emerging” to high-income status since the 2000s (e.g., Hong Kong, Singapore, etc.), it is still perceived to be different from North America and Europe regarding norms, regulations, and traditions. Thus these countries remain in the list.

3. Initial criteria, defining the content of the review:
  - Systematic review process;
  - Empirical papers, thus including data analysis and statistical tests;
  - Time span: 2007 – 2017 inclusive;
  - The leading IB, strategy, management, and marketing journals: Journal of International Business Studies (JIBS), Strategic Management Journal (SMJ), Journal of World Business (JWB), International Business Review (IBR), Journal of Marketing (JMar), Journal of Marketing Research (JMR), Marketing Science (MS), European Journal of Marketing (EJM), Academy of Management Journal (AMJ), Academy of Management Review (AMR), Administrative Science Quarterly (ASQ), and Journal of Management (JMan).
4. Search Method (stage 1):
  - A full search of all related articles across the targeted journals;
  - Web of Knowledge database;

- Inclusion criteria by general keyword search;
- Initial focus on abstract and title;
- Keywords: emerging, developing, transition market/country, international strategy, internationalization, knowledge development, and organizational learning.

The search transcript for Web of Knowledge advanced search: TS=((emerging econom\* OR emerging countr\* OR developing countr\* OR transition\* countr\*) AND internation\* strateg\* OR internationaliz\* AND organiz\* learning) AND SO=(journal of international business studies OR strategic management journal OR journal of world business OR international business review OR journal of marketing OR journal of marketing research OR marketing science OR european journal of marketing OR academy of management journal OR academy of management review OR administrative science quarterly OR journal of management). Language: English. 2007-2017.

First sample: n = 335

5. Exclusion criteria:

- An article does not clearly represent the context of the study, thus is unclear where the article originates from and what is the targeted market/country;
- Theory, analysis and/or conclusions do not relate to the knowledge development process, in spite of the use of the relevant keywords;
- If a unit of analysis of a paper are state-owned enterprises or business groups, as knowledge development process in such companies and private-owned firms differs significantly;
- Conceptual, review articles.

6. Search (step 2). Manual reading of all papers and judging for inclusion/exclusion based on the parameters mentioned in clause 5. The second (final) sample for the analysis: n = 52.

## APPENDIX 2: ARTICLES INCLUDED INTO THE REVIEW

| Title   | Author(s)                            | Year | Context  | Theory  | Research question   | Main findings  |
|---|--------------------------------------|------|--|---|---|--|
| Journal of International Business Studies   |                                      |      |  |   |   |  |
| Accessing vs sourcing knowledge: A comparative study of R&D internationalization between emerging and advanced economy firms  | Awate, S., Larsen, M., & Mudambi, R. | 2015 | R&D internationalization of EMNEs and DMNEs (wind power industry) (India vs Denmark) | OL: catch-up, accessing vs sourcing knowledge                             | The study of EMNE R&D internationalization by comparing it to that by DMNEs in the context of an emerging, knowledge-intensive industry   | The greenfield R&D subsidiaries of the DMNE are initially at a lower knowledge level than their headquarters. The primary knowledge flow is in the form of a “teaching” flow from headquarters to the subsidiaries. In contrast, the EMNE is more likely to experience that its foreign R&D subsidiaries are at a higher knowledge level than the headquarters. Thus the main drivers of headquarters’ innovation catch-up are the “reverse” knowledge flows from these subsidiaries to the headquarters. EMNE headquarters’ innovation catch-up, which relies more on knowledge accessing, is harder and slower as compared with a DMNE R&D subsidiary that relies on knowledge sourcing. |
| Adaptation, bridging and firm upgrading: How non-market institutions and MNCs facilitate knowledge recombination in EM        | R. A. Corredoria, G. A. McDermott    | 2014 | Argentinean auto parts suppliers to MNE subsidiaries                                 | KBV: upgrading competencies through accessing knowledge and resources. AC | How knowledge from MNEs helps to upgrade capabilities, improve products and processes? How local institutions help/hinder absorptive capacity?  | Multiple strong ties to resource-rich organizations and institutions had a consistently positive impact on supplier process upgrading. Upgrading depends less on access to technologies, more on the ways local organizational and institutional networks help firms to absorb it – importance of creating supporting institutions to provide information, industry data, trends and standards, which is difficult to collect on firms' own.   |
| Agglomeration, catch-up and the liability of foreignness in emerging economies.   | Lamin, A., & Livanis, G.             | 2013 | Foreign and domestic firms’ R&D labs in India  | OL: acquiring knowledge through catch-up and location choices. IT: LOF    | Does the liability of foreignness or catch-up dominate location decisions (co-locating or not? and with whom) of domestic and foreign firms in EMs?   | Both foreign and domestic prefer to agglomerate with same- and cross-industry firms to have access to knowledge spillovers. Co-location enables firms to engage in observation and environmental scanning, and benefit from demonstration effects. Co-location is a strategy for those aiming to imitate technology that can be easily observed.   |
| Are the extent and effect of psychic distance perceptions symmetrical in cross-border M&As? Evidence from a two-country study | Yildiz, H. E., & Fey, C. F.          | 2016 | M&As between Sweden and China  | OL: knowledge transfer. IT: LOF, psychic distance                         | (a) how do relative status characteristics affect low- and high-status group members' perceptions of the extent of psychic distance between one another, (b) how do psychic distance perceptions affect post- | Larger distance is more likely to generate a lack of knowledge and understanding of each party's ways of doing business, leading to alienation, stress, and lack of commitment to the combined organization. Chinese respondents showed a stronger willingness to implement a Swedish acquirer's organizational practices compared with vice versa. It says that relative economic development levels of home and host countries is a significant  |

|   |   |      |  |  |  |   |
|---|---|------|--|--|--|---|
|   |   |      |  |  | merger reactions, learning, and behavior?  | determinant of the extent of knowledge flows between sender and recipient units. Psychic distance perceptions could impede the success of post-merger integration.  |
| Autonomy delegation to foreign subsidiaries: an enabling mechanism for emerging-market multinationals                     | Wang, S. L., Luo, Y., Lu, X., Sun, J., & Maksimov, V. | 2014 | Chinese MNEs in developed and developing countries   | OL: subsidiary autonomy, springboard perspective. IT: LOF      | How does autonomy help to overcome LOF and enhance learning?   | Subsidiary autonomy assists EM firms in overcoming LOF, enhances learning and inward FDI, necessary in overcoming resource and capability voids. It as well distances the subsidiary administratively from the negative heritage associated with home-country institutions.   |
| Connections to distant knowledge: Interpersonal ties between more- and less-developed countries                           | Levin, D. Z., & Barnard, H.                           | 2013 | South Africa to developed countries (UK, US, Australia)                                    | OL: accessing/transfer knowledge                               | When business knowledge obtained from interpersonal ties (with compatriots now living in a more-developed country) is more useful than locally sourced knowledge?    | It is especially useful to seek knowledge abroad when the manager is in need for new-to-the-industry knowledge (the novelty of knowledge), and also when the manager already has strong ties with the contact abroad (the strength of the relationship); otherwise, the logistical and other difficulties of obtaining this new knowledge are too great, and we find that the manager would be better off contacting someone locally.   |
| Country-of-origin and industry FDI agglomeration of foreign investors in an emerging economy.                             | Tan, D., & Meyer, K. E.                               | 2011 | FDI in Vietnam   | OL: knowledge acquisition through location strategies. IT: LOF | Which foreign investors are likely to co-locate with FDI firms with the same country-of-origin rather than with foreign industry peers and under what circumstances? | Country-of-origin agglomeration is particularly relevant for gaining sensitive and tacit knowledge, for investors who perceive extensive institutional voids, and for those who lack local knowledge. Foreign entrants agglomerate to a greater extent than domestic firms, because foreign firms suffer from LOF, which affects their location strategy. In developed markets local firms do not pay much attention to location-specific activity, while in EMs locals actively agglomerate to get access to knowledge spillovers. |
| Do country-level institutional frameworks and interfirm governance arrangements substitute or complement in international | Abdi, M., & Aulakh, P. S.                             | 2012 | Partnerships of US' firms with firms from institutionally distant countries (37 countries) | OL: learning through partnership. IT: LOF                      | Potential of formal contracting and relational governance to overcome the formal and informal institutional gap  | Firms may offset the cultural barriers through learning. Informal arrangements developed at the relationship level have the capacity to overcome the difficulties engendered by dissimilarities in the informal institutional environment. In contrast, institutional and partnership-level formal arrangements are found to have a complementary relationship in which the positive relationship between contractual governance and performance is undermined at higher degrees of institutional hazard (dissimilarity).           |

|  |   |      |  |  |  |   |
|--|---|------|--|--|--|---|
| business relationships?  |   |      |  |  |  |   |
| Do international acquisitions by emerging-economy firms create shareholder value? The case of Indian firms   | Gubbi, S. R., Aulakh, P. S., Ray, S., Sarkar, M. B., & Chittoor, R. | 2010 | Cross-border acquisitions from India (mainly to US, UK, Germany) | OL: SAS acquisitions, asset-exploitation perspective       | International acquisitions facilitate internalization of tangible and intangible resources that are both difficult to trade through market transactions and take time to develop internally.                   | EM firms use internationalization as a spring-board to acquire strategic assets from diverse markets to overcome their disadvantages and become more competitive. Acquisition gives access to best practices, which gives valuable learning and opportunity to transform their routines.  |
| Failure to Complete Cross-Border M&As  | Zhou, C., Xie, J., Wang, Q.   | 2016 | Inbound and outbound M&A in BRIC                                 | OL: prior entry experience, experiential learning. IT: LOF | Factors, affecting the completion of cross-border M&A; how the impact of these factors differs in M&As to EMs and from EMs   | Acquirers from EM suffer from liability of foreignness more than the ones from developed countries. Past successful experience helps both, but acquirers from EMs going to DMs are more dependent on past experience, because they experience higher internal learning barriers.  |
| International experience and FDI location choices of Chinese firms: The moderating effects of home country government support and host country institutions. | Lu, J., Liu, X., Wright, M., & Filatotchev, I.                      | 2014 | FDI of Chinese firms to developed countries                      | OL: prior entry experience; KBV. IT                        | How government support of FDI projects and host country institutional environment interact with prior entry experience by Chinese firms.   | Home government support and well-developed host country institutions reduce the importance of prior entry experience and significantly increase the likelihood of FDI entry into a host country (home government support to the higher extent).   |
| Learning across geographic space: Pro-market reforms, multinationalization strategy, and profitability   | Dau L. A.   | 2013 | Latin American firms going to DMs                                | OL: knowledge acquisition, KBV                             | Pro-market reforms tend to increase the profitability of developing country firms, because they increase the competitiveness of local markets, allowing firms to increase their market-experiential knowledge. | The positive effect of pro-market reforms on profitability is higher for firms that operate internationally and in more advanced countries, because such firms acquire market knowledge that they can use to respond to reforms at home, which gives them advantage over other local firms. Importance of accessing useful and transferable knowledge to respond to reforms at home and get competitive advantage over other local firms. |

|  |   |      |   |   |   |   |
|--|---|------|---|---|---|---|
| Offshoring innovation to emerging markets: organizational control and informal institutional distance.   | Sartor, M. A., & Beamish, P. W.         | 2014 | Japanese MNEs' subsidiaries in EMs                            | OL: knowledge sourcing. IT: informal institutions | How differences in the informal institutions influence MNEs' strategy with respect to subsidiaries established to offshore innovation   | Knowledge sourcing - establishing subsidiaries in EMs to get access to new product and process innovation, global talent pools, and avoid institutional differences. An increase in technological uncertainty and demand uncertainty causes an MNE's preference for reduced organizational control to minimize costs by learning from the partners. |
| Strategic Management Journal   |   |      |   |   |   |   |
| Confidence in learning: Inter-and intraorganizational learning in foreign market entry decisions.  | Li, J., Qian, C., & Yao, F. K.          | 2015 | U.S. manufacturing firms investing in China                   | OL: prior entry experience                        | 1) How the number of previous entries (made by investors) affect the level of confidence of later entrants in imitating them. 2) How learning from target firms varies with the learning firm's experience in the host country. | A firm's location decisions are influenced by learning from a reference group. The firm doesn't necessarily copy the most frequently used practices but learns from decisions made by the more experienced investors. For firms with experience in the host country learning from others becomes less important.                                    |
| Generic and specific social learning mechanisms in foreign entry location choice   | Belderbos, R., Olffen, W. V., & Zou, J. | 2011 | Japanese electronics firms' entries into Chinese provinces    | OL: knowledge acquisition through location. IT    | Why do firms cluster in specific locations abroad?  | Firms' location decision is dependent on the type of information they need. If they need to assess economic feasibility of entry, they locate with agglomeration and apply assessment learning. If they need to reduce firm-level uncertainty and increase legitimacy, they follow specific prior investors, thus apply bandwagon learning.         |
| Risk and the strategy of foreign location choice in regulated industries   | García-Canal, E., & Guillén, M. F.      | 2008 | Spanish firms in Latin America                                | IT, OL: experiential learning, prior experience   | Firms operating in regulated industries respond to the presence of risks in foreign locations in different ways depending on the nature of the risk and their own characteristics.  | As firms gain international experience and compare the post-entry performance of investments in countries with different levels of policy instability, they become more reluctant to enter countries that are politically unstable.   |
| When Experience Meets National Institutional Environmental Change: Foreign Entry Attempts of U.S. Firms in the Central and Eastern European Region | Xia J., Boal K., Delios A.              | 2009 | US firms to Central and Eastern European transition economies | IT: institutional change. OL: prior experience    | When a change in a national institutional environment does occur, do experienced entrants follow the same entry pattern established by their previous entries, or do they make a divergent change?                              | Firms with entry experience tend to resist environmental change, that favors a hierarchical entry strategy over a relational entry strategy. Relational entry experience provides a basis for how to select a partner, acquire knowledge, and resolve coordination problems. This knowledge is transferable in the same or similar context.         |

|   |  |      |   |  |  |   |
|---|--|------|---|--|--|---|
| Whose experience matters in the boardroom? The effects of experiential and vicarious learning on emerging market entry.                 | Tuschke, A., Sanders, W. M., & Hernandez, E. | 2014 | German firms' FDI in EEs (Eastern Europe)                       | OL                                       | Experiential vs vicarious learning. Which ties matter most and how it influences learning outcomes?  | In novel situations such as emerging market entry, the focal firm seems to be most likely to act upon rich and fine-grained information provided by top managers of other firms that bring first-hand experience. Thus, experiential learning is more important in novel situations.  |
| Why strategic factor markets matter: "New" multinationals' geographic diversification and firm profitability                            | Kim, H., Hoskisson, R. E., & Lee, S. H.      | 2015 | Korean new MNEs (NMNEs) in developed and developing countries   | OL: SAS, experiential learning           | Examining firm profitability differences among NMNEs pursuing geographic diversification into two distinct types of geographic locations   | When NMNEs pursue geographic diversification into resource-poorer host countries, they are able to exploit their homegrown, firm-specific advantages and to take advantage of experiential learning efficiently. Learning is more complicated and takes longer time in resource-rich countries, however, experiential learning through diverse exposure to many resource-rich host countries helps NMNEs adapt to new resource environments better. |
| International Business Review   |  |      |   |  |  |   |
| Absorptive capacity development in Indonesian exporting firms: How do institutions matter?  | J. Gunawan, E. L. Rose                       | 2014 | Indonesian manufacturing-sector exporters (53% export to Japan) | IT, OL: AC / knowledge transfer          | How firms operating in a challenging institutional setting learn about entering international markets by using both sources of learning: internal (first-hand or direct experience) and external (second-hand or indirect). What type of knowledge is more beneficial? | Indonesian manufacturing exporters rely more heavily on second-hand experience for the development of their understanding about international markets. It suggests that the Indonesian institutional environment plays an important role in shaping how firms learn to internationalize, because Indonesian exporters rely mainly on local suppliers, who have little international experience.   |
| An event study of home and host country patent generation in Chinese MNEs undertaking strategic asset acquisitions in developed markets | Anderson, J., Sutherland, D., & Severe, S.   | 2015 | Chinese outward FDI to US, Japan, and EU                        | OL: SAS, knowledge accessing through FDI | Are Chinese MNEs able to absorb and exploit acquired foreign strategic assets?   | EMNEs try to move quickly to the technological frontier, using non-incremental learning processes by directly acquiring cutting-edge capabilities from their developed market counterparts to 'catch-up'. Strategic asset rich subsidiaries enjoy superior bargaining power over their "knowledge-inferior" parents and enjoy greater autonomy.   |

|   |   |      |  |   |   |   |
|---|---|------|--|---|---|---|
| Control mechanisms of MNEs and absorption of foreign technology in cross-border acquisition   | B. I. Park, J. Choi                                     | 2014 | Korean firms, acquired by MNEs from Europe, the US or Japan. Cross-border M&A  | OL: AC, knowledge transfer                                    | What control mechanisms (management and operational) positively affect knowledge absorption from MNEs in cross-border acquisitions?   | Subsidiary's knowledge acquisition depends on factors associated with management control mechanisms. Open communication is the most obvious knowledge transfer approach. Propensity to learn is higher for geographically close countries, which share historical and social connections.   |
| Equity commitment under uncertainty: A hierarchical model of real option entry mode choices   | Wooster, R. B., Blanco, L., & Sawyer, W. C.             | 2016 | The US to Latin America and the Caribbean (28 countries)                       | OL: prior acquisition experience                              | Entry mode choices under environmental uncertainty  | Firms with higher international experience are more likely to choose non-equity expansion mode in the form of representative offices to engage in experiential learning prior to making heavier investments. Learning can reduce both endogenous and exogenous uncertainty.   |
| Foreign knowledge acquisition through inter-firm collaboration and recruitment: Implications for domestic growth of emerging market firms | Chen, P. L., & Tan, D.                                  | 2016 | Chinese firms with IPO. Collaboration with firms from more developed countries | OL: knowledge acquisition                                     | The impact of the two mechanisms of knowledge acquisition, i.e., inter-firm collaboration and returnee recruitment, on the performance of emerging-market firms in the local market | To speed up the learning process, EM firms often acquire advanced technology and managerial skills from developed countries. Hiring returnee managers can serve as an important source of foreign knowledge for EM firms. Entrepreneurial firms' flexible organizational structures may foster a cooperative and learning culture, which makes acquiring returnees' knowledge effective. In contrast, privatized state-owned firms are less likely to change due to organizational inertia, which, in turn, inhibits their capability of absorbing knowledge from hiring returnees. |
| Institutional forces in adoption of international joint ventures: Empirical evidence from British retail multinationals                   | Owens, M., Palmer, M., & Zueva-Owens, A                 | 2013 | British MNEs in South-East Asia  | IT. OL: knowledge sourcing                                    | Factors that influence the decision to adopt international JV by MNEs   | Learning through international JVs gives access to tacit knowledge, market knowledge, host country regulatory and social frameworks. The knowledge is used to build legitimacy, overcome liability of foreignness.  |
| Internationalization of emerging Indian multinationals: Linkage, leverage and learning (LLL) perspective                                  | Thite, M., Wilkinson, A., Budhwar, P. and Mathews, J.A. | 2016 | Indian MNEs investing to developed countries                                   | OL: LLL   | How the case study organizations have evolved themselves to become credible global players by leveraging on their learning  | Major acquisitions are made mainly in developed markets for intangible asset seeking and market opportunity seeking. Indian companies are engaging in overseas acquisitions to primarily gain access to customers in new geographical markets more quickly, to gain advanced technologies or products, and to acquire management talent with the mind-set and skills to operate businesses in more advanced or competitive conditions.  |
| Leadership positioning among U.S. firms investing in China  | Wooster, R.B. and Paul, D.L.                            | 2016 | US firms investing in China  | OL: prior experience. Awareness, motivation, capability (AMC) | How AMC characteristics influence international investment decisions?   | Willingness to be first movers in a new geographic market likely stems from confidence that the learning from existing multinational operations transfers to a new geographic region. Further, this stock of learning enhances capability to pioneer new foreign investment.  |

|  |  |      |  |  |   |   |
|--|--|------|--|--|---|---|
|  |  |      |  | framework.                                 |   |   |
| Localized learning by emerging multinational enterprises in developed host countries: A fuzzy-set analysis of Chinese foreign direct investment in Australia | Fan, D., Cui, L., Li, Y. and Zhu, C.J. | 2016 | Chinese FDI to Australia                                   | OL   | What motivates EMNEs to engage in localized learning in developed host countries?   | The efforts of establishing local networks are more desirable and advantageous if Chinese MNEs are willing to overcome local trade barriers, host country regulatory uncertainty, and achieve managerial efficiency.  |
| Microfoundations for learning within international joint ventures  | Park, J.Y. and Harris, S.              | 2014 | UK's Tesco IJV with Korean Samsung. Case study of Homeplus | OL: AC / knowledge transfer                | What are the capabilities, actions and decisions that help IJV managers to learn from their partners, to develop capability from that learning, and to build the absorptive capacity needed to do so. | Prior knowledge and experience, as well as the underlying educational level of the IJV managers, appeared to help the AC of the IJV and its speed of learning. Learning between partners from different national contexts is inhibited by different ways of social interaction and different understandings. If the partners have different organizational cultures, developing AC is especially complex. |
| Performance of foreign subsidiaries: Does psychic distance matter?   | Dikova, D.                             | 2009 | FDIs of West-European MNEs to Central and Eastern Europe   | OL: prior experience. IT: psychic distance | How prior experience helps to deal with psychic distance?   | A possession of market-specific information means that the investing firm understands the specific market and its characteristics such as business climate, culture, structure of the market system, and individual customers. It stimulates organizational learning about the new market and ultimately eliminates the effect of psychic distance.   |
| Skills and complexity in management of IJVs: Exploring Swedish managers' experiences in China  | Demir R., Soderman S.                  | 2007 | Swedish JV to China (9 case studies)                       | OL: AC                                     | Experience of Swedish managers in Chinese-Swedish IJVs in China   | The learning ability of the firm is based on (a) the specific institutional properties of the home country, (b) the firm's ability through internal practices and communication systems to overcome knowledge transfer inertia, and (c) the accumulated knowledge of host country characteristics.  |

|  |  |      |   |  |  |  |
|--|--|------|---|--|--|--|
| The evolution of strategic asset-seeking acquisitions by emerging market multinationals                              | Elia S., Santangelo G. D.                | 2017 | BRIC acquisitions in the Triad (US, EU, Japan)                                | OL: SAS. IT  | The extent to which EMNEs engage in SAS acquisitions in advanced countries in relation to the strength of their home- and host country national innovation system (NIS).                       | EMNEs used SAS acquisitions as a compensation strategy for their relatively weak home-country NIS in the early phase of their internationalization, and that more recent SAS acquisitions by EMNEs are supported by relatively stronger home-country NIS. The weaker the host-country NIS, the greater the intention to engage in SAS in the early phases of internationalization.   |
| What does location choice reveal about knowledge-seeking strategies of emerging market multinationals in the EU?     | Jindra, B., Hassan, S. S., & Cantner, U. | 2016 | FDI from EMs to EU (UK, Germany, Spain, Italy, etc.)                          | OL: knowledge acquisition through location choices | To which extent EM MNEs are attracted by agglomeration economies and knowledge externalities?  | Foreign entry by firms from EMs is more likely, when a given region is characterized by a diversified industry structure in comparison to all other alternative regions. Investors from EMs use FDI to implement knowledge and asset seeking type of strategies in order to increase/enhance their ownership specific assets.  |
| Journal of World Business  |  |      |   |  |  |  |
| Accelerated internationalization and resource leverage strategizing: The case of Chinese wind turbine manufacturers. | Tan, H., & Mathews, J. A.                | 2015 | Chinese wind turbine manufacturers' internationalization to developed markets | IT. OL: LLL  | How firms from EMs globalize at an accelerated pace  | Accelerated internationalization of many EMMNEs has been facilitated by their LLL strategies. They all seemed to first enter the field by forming various types of partnerships with companies from developed countries in order to tap into sources of technological knowledge (linkage); they then quickly built their capability by capturing opportunities arising from the technological and market dynamics and exploiting advantages of both its foreign partners and itself (leverage); and they learned from technological leaders which ultimately lead to indigenous innovation that are adapted to the local context (learning). |
| Chinese enterprises in Germany: Establishment modes and strategies to mitigate the liability of foreignness          | Klossek, A., Linke, B. M., & Nippa, M.   | 2012 | Chinese FDI (acquisition or greenfield) to Germany                            | OL: prior experience. IT: LOF                      | To identify and to describe how entry mode choice impacts the strategies adopted by Chinese firms to cope (or not to cope) with the specific institutional and competitive hurdles in Germany. | Accumulation of experience and knowledge helped Chinese firms manage their market entrance into Germany. Knowledge and experience from previous relationships may be especially helpful for firms who enter a market through acquisition.  |
| Contextualizing experience effects in international business: A study of ownership strategies                        | Li, P. Y., & Meyer, K. E.                | 2009 | Taiwanese subsidiaries in developed and emerging countries                    | OL: prior experience                               | Examining the effects of international experience on MNEs' ownership strategy across a range of developed and developing economies   | In Europe, where institutions and the general business environment are more stable and transparent, investors would be able to apply their knowledge acquired in other countries. These benefits arise more from general international experience (GIE), rather than country-specific experience (CSE), because it can be transferred to other locations. Thus, GIE is more valuable in  |

|  |   |      |   |   |   |   |
|--|---|------|---|---|---|---|
|  |   |      |   |   |   | developed countries, while CSE in EMs.  |
| Cross-border acquisition in services: Comparing ownership choice of developed and emerging economy MNEs in India                             | Lahiri, S., Elango, B., & Kundu, S. K.  | 2014 | Cross-border acquisitions in India from DCs and EMs.  | OL. IT: institutional distance  | How service MNEs from developed and EMs differ in their acquisition behavior?   | Due to prior experience and greater international competitiveness (comparing to EMNEs), MNEs from developed countries begin their foreign expansion by initially sharing ownership and control. The likelihood of full acquisition over partial acquisition becomes stronger when transactions involve high institutional distance.   |
| Emerging economies and institutional quality: assessing the differential effects of institutional distances on ownership strategy            | Liou, R. S., Chao, M. C. H., & Yang, M. | 2016 | Ownership strategies (cross-border M&As) of EMNEs (mostly BRIC countries) in developed and developing countries | OL: knowledge acquisition through partnership. IT: institutional distance | Differential effects of formal and informal institutions on EMNEs' ownership strategies   | Acquisitions afford the EMNEs opportunities to work with the local partner and access their knowledge about the market. EMNEs tend to secure higher ownership control to enjoy the governance efficiency when they conduct acquisitions in a country with better developed formal institutions and lower their equity participation and rely on the acquired firms to alleviate the legitimacy threat when they acquire a target in a country with large informal institutional distance. |
| Emerging market multinational companies' evolutionary paths to building a competitive advantage from emerging markets to developed countries | Kotabe M., Kothari T.                   | 2016 | 59-years longitudinal analysis of 16 companies from China, India  | OL  | How the EMNEs build their competitive advantage from home markets to developed country markets over time?                           | The knowledge and experience gained by EMNEs through their relationships with trade associations, institutions of higher education and MNCs in the home nations, enables them to enter into partnerships and sometimes even acquire firms from developed countries. The overall pattern of successfully entering developed economies involves putting emphasis on learning and knowledge sharing that leads to the innovation of the product and process.                                 |
| Institutional duality and political strategies of foreign-invested firms in an emerging economy  | Zhang, Y., Zhao, W., & Ge, J.           | 2016 | Foreign-invested firms from developed and developing markets in China   | OL  | How the complex institutional environment surrounding foreign-invested firms affects their corporate political strategies in China. | Foreign-invested firms from developed Western markets can learn about local political arrangements (guanxi) and adopt firm-based political tactics to engage the host government through collaboration with domestic or foreign business associations.  |

|  |   |      |  |                        |  |  |
|--|---|------|--|------------------------|--|--|
| Integration and responsiveness in subsidiaries in emerging economies   | Meyer, K.E.,<br>Su, Y.S.                              | 2015 | FDI of West Europe and North America to Poland and Hungary             | OL                     | For which subsidiaries does a transnational strategy enhance subsidiary performance? Which strategy helps to integrate knowledge from all the subsidiaries?  | The competitive advantage of the transnational MNE is to a large extent created by organizational learning that connect, integrates and exploits this geographically dispersed knowledge. Transnational strategy is a good answer for MNEs with many subsidiaries in different countries, because it helps to integrate and use knowledge from all of them.  |
| Legitimacy and accelerated internationalization: An Indian perspective   | Bangara, A.,<br>Freeman, S.<br>and<br>Schroder, W.    | 2012 | SMEs founded in India, their FDIs to developed markets                 | OL: LLL                | How do EM SMEs build their legitimacy in Western markets to accelerate their internationalization?   | By using committed modes of entry early in their internationalization, which builds legitimacy, SMEs from EMs can access financial resources in Western markets to overcome their liabilities (newness, foreignness, emergingness and outsidership). LLL strategy facilitates accelerated internationalization of SMEs.  |
| Outcomes of learning through JVs for local parent firms in transition economies: Evidence from Russia                | Mihailova I.  | 2014 | Russian JV parent firms  | OL                     | Benefits of learning for JV parent firms in EMs.   | Local companies in EMs are more in need for market-based managerial capabilities than for technological ones. Knowledge and capabilities about how to operate in market conditions are no longer in high demand for local firms in EMs as it was argued earlier.   |
| Reducing cultural uncertainty through experience gained in the domestic market                                       | Hong, S. J., &<br>Lee, S. H.                          | 2015 | Korean MNE in different markets  | OL: knowledge transfer | Do firms with related experiential knowledge face less cultural uncertainty in the host country and therefore are more likely to enter the country than those firms without such foreign-market knowledge? | Transferrable knowledge (both direct and indirect) reduces cultural uncertainty. General knowledge is more effective and important for international business, because can be applied everywhere.  |
| Selecting the country in which to start internationalization: the non-sequential internationalization model          | Cuervo-Cazurra, A.                                    | 2011 | Moroccan firms going to different countries                            | OL                     | Which type of knowledge is beneficial in what internationalization strategies?   | In the home country a firm is able to develop dimensions of knowledge that are useful to overcome the difficulties of internationalization. A firm that operates in a B2B industry and that has an alliance with a foreign company in the home country is more likely to select a non-sequential internationalization.   |
| The influence of political risk on the scope of internationalization of regulated companies: Insights from a Spanish | Jiménez, A.,<br>Luis-Rico, I.,<br>& Benito-Osorio, D. | 2014 | Spanish MNEs in politically unstable markets (sample of 119 countries) | OL                     | Whether political risk has a diverse impact on internationalization strategy dependent on the particular industry to which the company belongs.  | A greater diversity of political environments has a positive impact on the scope of internationalization of Spanish MNEs. It will be stronger in those companies belonging to industries subjected to higher levels of regulation by the authorities, because such previous experience helps firms to create and develop political capabilities. More diverse experience leads to better (more positive) perception/attitude towards political risk. |

|   |                                    |      |   |                           |  |   |
|---|------------------------------------|------|---|---------------------------|--|---|
| sample  |                                    |      |   |                           |  |   |
| The interactive effect of time and host country location on Chinese MNCs' performance: An empirical investigation   | Yuan, L., Pangarkar, N., & Wu, J.  | 2016 | Chinese MNEs going to developing and developed countries          | OL                        | Examining the effects of internalization on performance in the immediate term as well as performance changes over time                                     | Expansion into developed countries results in a negative performance impact in the immediate term, but because of learning effects, MNCs' performance improves over time. To leverage the learning opportunities that developed countries provide, managers of developing country MNCs must proactively acquire knowledge from all potential sources, including customers, competitors, and regulators.   |
| What drives firms' intent to seek strategic assets by foreign direct investments? A study of emerging economy firms | Cui, L., Meyer, K. E., & Hu, H. W. | 2014 | Chinese FDI   | OL: catch-up, SAS         | What factors contribute to the level of SAS intent in internationalizing EM firms? What drives firms to engage in competitive catch-up with world leaders? | SAS FDI involves the acquisition of knowledge-based resources that exist outside the firm's boundaries such as technology, brands, and managerial know-how. SAS FDI is intended to renew a firm's core-competences by enabling radical improvements to its current knowledge base and competitive position. SAS FDI is extensively used by EM MNEs to aggressively catch-up with world leaders.   |
| Why do Chinese firms tend to acquire strategic assets in international expansion?                                   | Deng, P.                           | 2009 | Chinese M&As in developed markets                                 | IT, OL                    | Why more and more Chinese firms are investing especially in developed economies to acquire strategic assets typically by aggressive M&A?                   | By escaping to and operating in an institutionally more efficient, transparent and encouraging environment, firms are able to concentrate on building their knowledge basis and developing and upgrading their competitive advantages. M&A could help Chinese firms to engage in exploratory learning through establishment of partnerships with foreign sellers in developed markets, thus acquiring country-specific knowledge and leapfrogging to higher value activities.   |
| Administrative Science Quarterly  |                                    |      |   |                           |  |   |
| When Does Prior Experience Pay? Institutional Experience and the Multinational Corporation                          | Perkins, S.                        | 2014 | Foreign investments (mostly from DMs) in Brazil, telecom industry | OL, experiential learning | The conditions under which prior internationalization experience leads to performance  | The findings suggest that variations in learning contexts affect organizations' learning curves. Prior experience pays most consistently when the institutional environment is similar. Environmental context is integral to the organizational learning process and similar contextual factors are critical to learning outcomes. When firms try to apply irrelevant experience in a new country (not similar to country where the experience is from), the risk of failure increases, because managers overestimate |

| Journal of Marketing  |  |      |  |                                 |   |  |
| Indirect learning: How emerging-market firms grow in developed markets? | Banerjee, S., Prabhu, J. C., & Chandy, R. K. | 2015 | Indian firms in DMs, and U.K. firms in India             | OL. Knowledge acquisition       | Whether indirect learning (learning from the experience of others) plays a crucial role in explaining the phenomenon of EM firms that succeed in DMs? | In contrast to DM firms, which learn from their own experience, EM firms learn indirectly about how to compete in developed markets by acquiring this knowledge from leaders, competitors, and network members. The stage and pattern of business evolution is different in EMs than in DMs. E.g. EM firms often lack knowledge of how to compete in DMs and do not have the luxury of learning over time from their own direct experience in DMs, as internationalization occurs much later and in a more compressed time period. |
| The Academy of Management Journal                                       |  |      |  |                                 |   |  |
| Economic Distance and the Survival of Foreign Direct Investments        | Tsang, E. W. K., & Yip P. S. L.              | 2007 | FDIs from Singapore to more and less developed countries | OL. Exploration vs exploitation | Does the economic distance between a home country and a host country have any effect on the hazard rates of FDIs?                                     | Acquisitions represent a more efficient way than greenfields to get access to strategic assets and greenfields are in little help if firms are interested in resource exploration in more developed countries. Acquiring a local firm confers immediate access to its social networks, an advantage that can take a long time to develop otherwise.  |

## INTERNATIONALIZATION PATTERNS OF GERMAN START-UP FIRMS FROM THE CLEANTECH INDUSTRY

Neubert, Michael

Provadis School of International Management and Technology, Frankfurt, Germany

### ABSTRACT

The purpose of this multiple-case study is to explore the perceptions of the founders of CleanTech firms about the internationalization behavior of these firms using the establishment chains of the Uppsala model (UIPM) as conceptual framework. The research design is based on the purpose of this study. This study uses a multiple-case study research design to get a better understanding about the internationalization behavior of CleanTech firms. Data was collected through six interviews of subject-matter experts and corporate documents to allow for triangulation. Data analysis revealed four themes to answer the research question. The findings suggest that CleanTech firms seem to prefer an incremental internationalization process and show a prudent internationalization behavior: (1) German CleanTech firms prefer to penetrate their home market first before considering internationalization. (2) The CleanTech firms use export market entry forms to enter neighboring markets. (3) The management teams seem to have little experience and expertise in the development and execution of international strategies. The two limitations sample size and methodology limit the generalizability of the results. The results of this multiple-case study bestow major significance toward practice. Investors like government funds or business angels, need to understand when a CleanTech firm has the potential for internationalization. Founders need the respective knowledge, experience, and resources, as do coaches working at accelerators and incubators to support these CleanTech firms in the design and the execution of their international strategies. This study contributes to the international entrepreneurship literature by illustrating the internationalization behavior of German CleanTech firms.

*Keywords: CleanTech, Renewable Energy, Sustainability, Uppsala Model, Export, International Entrepreneurship.*

### INTRODUCTION

CleanTech firms receive increasing interest from private and public investors (Doblinger, Surana, & Anadon, 2019). Due to the limited size of their home market and the public support (e.g., funding,

coaching), they should internationalize early and fast after the development of their minimal viable products, to become profitable and large enough to compete successfully with their international counterparts (Neubert, 2017). Therefore, it is necessary to better understand the internationalization behavior, the internationalization patterns and the processes of these CleanTech firms and how they differ from other high-tech firms (Asemokha, Ahi, Torkkeli, & Saarenketo, 2019) from other countries (Neubert, 2017; Neubert & Van der Krogt, 2018).

The purpose of this multiple-case study is to explore the perceptions, views, and opinions of the founders and senior executive managers of CleanTech firms about the internationalization processes and behavior of their companies using the establishment chains of the Uppsala internationalization process model (UIPM) (Vahlne & Johanson, 2017; Neubert, 2018) as conceptual framework. This study follows a call for research from Neubert and Van der Krogt (2018) to study the internationalization behavior and processes of high-tech firms from other industries and countries and two calls of research from Perényi, Á., & Losoncz, M. (2018) about the internationalization of social entrepreneurs and sustainable firms like for example from the CleanTech industry, and how and why young firms internationalize.

This paper is structured as follows: After this introduction, the literature review covers the most recent papers about the internationalization of CleanTech firms and the conceptual framework used in this study. The third chapter presents the nature of the study. This includes the research methodology, the sampling strategy and the sample description, the research question, as well as data collection and analysis methods. The results are presented in the fourth and discussed in the fifth chapter. This paper will conclude with a list of key findings, an analysis of the impact of the research results for academics, policymakers, and practitioners, as well as recommendations for further research.

## **LITERATURE REVIEW AND CONCEPTUAL FRAMEWORK**

The purpose of the multiple-case study is to explore the perceptions, views, and opinions of the founders and senior executive managers of CleanTech firms regarding the internationalization processes and behavior of these firms. This takes place as a conceptual framework by using the market distance and the market commitment establishment chains (Neubert, 2018) of the Uppsala internationalization process model (UIPM) (Vahlne & Johanson, 2017).

The UIPM distinguishes two establishment chains (Vahlne & Johanson, 2017). The market distance establishment chain describes an incremental market development process (see Table 1). CleanTech firms are expected to enter incrementally into new foreign markets depending on the lowest cultural, administrative, geographical, and economic distance between their home and the target market or the highest country familiarity (Clark, Li, & Shepherd, 2018). As the CleanTech firms of our sample are all

based in Germany, the first market entries might be expected in the same free-trade area, thus the European Union.

| Establishment Chains    | Market Commitment   |  |
|-------------------------|---|--|
|                         | Low   | High   |
| Low                     | Low risk market entry mode (e.g., export) to neighboring countries (e.g., EU) | High risk market entry mode (e.g., wholly-owned subsidiary) to neighboring countries |
| Market Distance<br>High | Low risk market entry mode to far away countries (e.g., China)                | High risk market entry mode to far away countries                                    |

Table 1: Establishment Chains of the UIPM as Theoretical Framework Source: author

The market commitment establishment chain shows that CleanTech firms are expected to enter new foreign markets with low risk market entry forms, for example, with different export modes (see Table 1). With increasing market knowledge and relationship development (Vahlne & Johanson, 2020; Vahlne & Bhatti, 2019), the CleanTech firms are expected to dedicate additional resources to this market (e.g., establish a branch office or a wholly-owned subsidiary) based on a decreasing liability of foreignness and outsidership as well as a better understanding about how to transfer their firm-specific advantages to this market (Neubert & Van Der Krogt, 2017; Neubert, 2017). This networking and learning ability drives the speed of internationalization (Neubert & Van der Krogt, 2018; Yamin & Kurt, 2018) depending on the level of digitalization of international decision-making processes as well as the international experience and expertise of the entrepreneur (Neubert, 2018; Coviello, Kano, & Liesch, 2017).

Besides the establishment chains of the UIPM, high-tech firms in their early stages of internationalization might also show uneven and discontinuous internationalization patterns (Kriz & Welch, 2018) or use different internationalization strategies (e.g., an opportunity-based market entry strategy (Neubert & Van der Krogt, 2020), or the Born Global or Lean Global Start-up model (Monaghan, Tippmann, & Coviello, 2020; Neubert, 2018; 2017). This occurs especially when they are from small and open economies (SMOPECs) (Neubert, 2018). As Germany can't be considered as a SMOPEC, this study uses only the conceptual framework of the UIPM.

## RESEARCH METHODOLOGY

The choice of the research method is based on the purpose of this study. The purpose of this study is to explore the perceptions, views, and opinions of the founders and senior executive managers of CleanTech firms as concerns the internationalization processes and behavior of their CleanTech firms. This study uses a multiple-case study research methodology to get an in-depth and holistic understanding about this specific phenomenon and to explore new themes and relations between them

using different sources of evidence, which may be transferable to similar cases (Yin, 2018; Merriam & Tisdell, 2019).

The following research question is based on the purpose and the nature of this study:

What are the perceptions, opinions, and views of the founders and senior executive managers of CleanTech firms about how their CleanTech firms internationalize?

Our purposeful sampling approach sought to recruit one senior executive manager and founder of each of the six CleanTech firms, which have successfully completed an accelerator program funded by the European Institute of Innovation and Technology (EIT) in 2019 (<https://eit.europa.eu/>) (see Table 2). All CleanTech firms are university spin-offs, which participated in the accelerator program to develop their business models and products, to get funding, and to acquire their first clients. Thus, they are deeply embedded in their national ecosystems. The CleanTech firms are part of the CleanTech Industry and offer innovative products to manage electric power grids with different sources of energy, to collect data about traffic and air pollution, to recycle batteries, and to store energy (Neubert, Rams, & Utikal, 2020).

Table 2: Case Study Firms Source: author

The six subject matter experts (SMEs) are all senior executive managers and founders of CleanTech firms with at least three years' experience as entrepreneurs. They hold university degrees in science and started their business ideas as university spin-offs. During the accelerator program, they developed the skills to manage a CleanTech firm successfully.

Data was gathered in October 2019 through a series of six video-telephonic, semi-structured interviews of senior managers and founders of CleanTech firms (including a reflective field journal to note observations about what is said and what is not said, consciously and unconsciously, direct and indirect) and through corporate documents such as business plans, strategic papers, product descriptions and client portfolios to allow for triangulation (Yin, 2018). The video-recorded interviews were transcribed electronically using the QDAS software NVivo and sent to the interviewees for member checking to strengthen the credibility and confirmability of the data (Merriam & Tisdell, 2019). Data analysis started with a careful analysis and complete immersion in the data. Data coding occurred with the QDAS software NVivo followed by a with-in and cross case analysis to explore similarities and differences (= replication logic according to Halkias & Neubert, 2020; Yin, 2018). The outcome of

the qualitative interviews was triangulated with archival documents in the form of the case study's business plans, strategic papers, product descriptions, and client portfolios (Yin, 2018) to enhance the dependability of the findings (Ravitch & Carl, 2019). The four themes emerging from the data analysis will be presented in the next chapter.

## RESULTS AND FINDINGS

The data analysis revealed the following four themes to answer the research question about the perceptions, opinions, and views of the founders and senior executive managers of CleanTech firms about how their CleanTech firms internationalize.

*Theme 1: CleanTech firms prefer to develop their home market first. Early and fast internationalization even within the European Union is not considered as an immediate strategic option.*

All SMEs have a strong national business focus due to government regulations and processes, their access to public funding, and finally their integration in the national CleanTech ecosystem and network. With the exception of SME 1, all other SMEs still expect a sufficient market potential in their home market. According to SME 5, one reason is "piggyback export", i.e. often B2B clients integrate the software, the sensors, or the batteries in their own products and export them. SME 2 states that the high investments to make their software legally compliant even in other markets of the European Union, prevented them so far from going abroad. SME 3 and 4 also sell their sensors to the local municipalities in their home market, which is a very specific market (requiring detailed market knowledge and an excellent network) with a huge potential. SME 5 and 6 still see a high market potential in their home market for their energy storages and battery recycling process. They are both open to international opportunities, but they are not actively pursuing them.

*Theme 2: If CleanTech firms internationalize, they focus on attractive markets within the European Union.*

Two CleanTech firms in this sample have already developed new foreign markets. SME 1 stated that their foreign markets are in the European Union due to government regulation and national security issues. Especially the latter makes it quite challenging to sell their electric power grid management software outside of the European Union. SME 5 acknowledges that they have an opportunity- or network-based approach. Besides their home market, they actively develop business opportunities in the European Union, but they are also open to requests for their energy storage systems from the rest of the world. The SMEs 2, 3, 4, and 6 are currently not planning to internationalize, but assume that they would focus on the European Union in the first phase of their internationalization.

*Theme 3: CleanTech firms use export market entry forms to internationalize.*

The statements of the SMEs suggest that they prefer export market entry forms. SME 1 and 5 state that they are using a combination of the market entry form "indirect export" with a distributor in each

foreign market and “direct export” through the online store on their website. The other SMEs also use the market entry form “direct export” through the online store on their English website to give potential clients the possibility to contact and to purchase their products. SME 2 adds, that they occasionally receive requests from potential international B2B leads through their online shop, but due to market adaptation needs and compliance issues they carefully check whether they should consider a delivery. All SMEs state that they are also thinking about piggyback export, when approaching potential B2B clients in their home market.

*Theme 4: The management of CleanTech firms has little experience and expertise in international entrepreneurship and management.*

SME 1 recognizes that their management team has a limited international experience and expertise, even though they get great support from their coaches. SME 1 considers it as a learning-by-doing process or an incremental internationalization process. According to SME 5, their management team has some more experience and expertise in international business, but still lacks important competences (e.g., the sustainable acquisition of clients in foreign markets). SMEs 2, 3, 4, and 6 admit that they have little or no experience and expertise in designing and implementing an internationalization strategy. They acknowledge that the participation in international conferences, trade fairs, and seminars is interesting, but certainly not sufficient; and therefore, prefer to use an incremental or step-by-step internationalization process.

The analysis of the archival data offers supporting evidence for this theme. The business plan and the strategy paper of the case study firms 2, 3, 4 and 6 include just a reactive and incremental internationalization and hence dedicate few resources to the development of the required competencies. The documents of the case study firms 1 and 5 include an internationalization strategy and their management teams consequently show a higher level of international experience and expertise.

| Market Entry Form<br>Region  | Direct export<br>(online / website)                   | Indirect export<br>(distributors)   | Piggyback export (home<br>market clients)                        |
|--|---|---|--|
| Other EU markets<br>depending on market<br>opportunities and<br>attractiveness | Passive:<br>Answer requests from<br>potential clients | Active:<br>In attractive EU markets,<br>they hire a local<br>distributor. | Passive:<br>Follow their existing B2B<br>clients to new markets. |

Table 3: Internationalization Process of CleanTech Firms (source: author)

## DISCUSSION

The results of this multiple-case study suggest that CleanTech firms consider internationalization only as a strategic option after they have successfully developed their home market. Internationalization should start in the neighboring European Union markets using export market entry forms due to

limited financial resources as well as limited international expertise and experience. This internationalization process and behavior seem to confirm the two establishment chains of the UIPM used as the conceptual framework of this study (Vahlne & Johanson, 2017). During the early stages of internationalization, the CleanTech firms in this sample prefer to enter neighboring markets in the European Union using low risk market entry forms (Vahlne & Johanson, 2017) or in other words prefer to combine a low market commitment with a low market distance (see Table 3). This internationalization strategy might be considered as a “Regional Exporter” model (Neubert & van der Krogt, 2020), even though it is still unclear whether internationalization becomes a better option for the CleanTech firms in our sample as soon as their home market is saturated and whether they will increase their market commitment as soon as they have the first successes abroad. The findings also suggest that the SMEs are not planning to consider a born global or lean global start-up model (Monaghan et al., 2020; Neubert, 2018; 2017). Another suggestion of the findings explores the reasons for this slow and late internationalization, which may lie in the missing international experience, internationalization knowledge and international networks. Underlying factors as the sufficient size of their home market Germany, the possibility to sell to exporting B2B clients, or high market entry barriers may confirm these reasons.

## CONCLUSION

The purpose of this multiple-case study is to explore the perceptions, views, and opinions of the founders and senior executive managers of CleanTech firms concerning the internationalization processes and behavior of their CleanTech firms using the establishment chains of the UIPM as a conceptual framework. The findings suggest that CleanTech firms of this sample seem to prefer an incremental internationalization process and show a prudent internationalization behavior based on the following key results:

Germany is not a SMOPEC, which forces the CleanTech firms in our sample to internationalize early and fast. Thus, they prefer to penetrate their home market first before considering internationalization. The CleanTech firms use export market entry forms to enter neighboring markets in the European Union. Therefore, they might be considered as a “Regional Exporters” (see Table 4).

| Establishment Chains | Market Commitment   |  |
|----------------------|---|--|
|                      | Low   | High   |
| Low Market Distance  | Low risk market entry mode (e.g., export) to neighboring countries (e.g., EU) | High risk market entry mode (e.g., wholly-owned subsidiary) to neighboring countries |
| High Market Distance | Low risk market entry mode to far away countries (e.g., China)                | High risk market entry mode to far away countries                                    |

Table 4: Establishment Chains of the UIPM as Theoretical Framework Source: author

The management teams of almost all CleanTech firms in our sample seem to have little experience and expertise in the development and execution of international strategies. It needs further research to understand whether this is a reason for their prudent internationalization behavior or the market potential of their home market, or something else.

The results of this multiple-case study have a high significance for practice. Investors like government funds, business angels, and venture capitalists need to understand when a CleanTech firm has the potential for internationalization and therefore need to dedicate enough resources accordingly. Founders, entrepreneurs and managers need the respective knowledge, experience, and resources as do consultants and coaches working at accelerators and incubators to support these CleanTech firms in the development and the execution of their international strategies.

One limitation is based on the research methodology. Even though we believe that the evidence resulting from the replication process of this multiple-case study may be utilized to extend theory (Halkias & Neubert, 2020), we assume that the findings just may be transferable to similar cases in Germany. The second limitation is based on the sample. Internationalization behavior and processes might differ depending on the industry, the management, and the home country. Thus, additional studies with corporate data from different countries (Vrontis, Basile, Andreano, Mazzitelli, & Papasolomou, 2020) and industries, and with different research methodologies are needed before results could be generalized.

## DATA PROCESSING TECHNIQUES IN SOCIAL GRAPH STRUCTURES

Obretin, Alexandru Marius

Economic Informatics Department, Bucharest University of Economic Studies, ASE, Bucharest, Romania

### ABSTRACT

This paper aims to present a concrete use case of an indoor positioning system used to harvest data about a small-sized population and interpret the data to identify clusters within and reveal strong affinities among subjects, acting as an analysis tool that helps stakeholders understand, in an unnoticed manner, what their clients are interested in, to better address their needs. A group of twenty people have used a software solution developed in previous own research initiatives that gather recordings from build-in smartphone sensors and trace the path a subject has followed inside a museum. Data modeling techniques applied on the collected sets provided structure and meaning to raw measurements, while graph analysis methods helped identify individuals with common interests and disclosed the most successful points of interest within the venue. The principles applied in this article emphasize how common devices can be used in a discrete, unperceivable manner in social analysis to determine human preferences that might further back recommendation engines, assisted learning and marketing campaigns. The methods and assumptions presented in this paper provide a cost-effective approach for cultural and educational institutions that are interested in better understanding their public through technology to build software solutions that on the one hand could outline their key strengths and on the other hand could reveal community interests that are worth being exploited for improved services quality and increased customer satisfaction, both influencing better financial results.

*Keywords: graph databases, indoor positioning system, social networks algorithms, entrepreneurship.*

### INTRODUCTION

The accelerated progress of information technology from the last decades contributed to a more connected world where data is constantly generated. Such extensive volumes of information determined the appearance of novel fields of activity like data analysis, where raw input is turned into meaningful evidence. This article aims to describe how an infrastructure free indoor positioning system might be used to harvest details about a small-sized population and what data processing techniques can be applied on the collected information to reveal common affinities of the members and identify clusters within. Enhancing author's previous work, the paper presents a concrete use case where the

above stated objectives compose an analysis tool that can help stakeholders understand, in an unnoticed manner, what their clients are interested in, to better meet their expectations.

Previous efforts in the field of knowledge acquisition revealed strong dependencies between the subject's personality and the proper technique to be used (Dehghani & Akhavan, 2017), as well as out of the box solutions to approach stringent marketing issues (Wagner & Zubey, 2005). This paper proposes a software architecture specialized in knowledge acquisition that is custom developed for cultural institutions.

According to the book "Cities, museums and soft power" (Lord & Blankenberg, 2015), museums fulfil four distinct roles:

- attract tourists and residents, acting as ambassadors for a particular area
- define the relationship between classes in society through the side they take in social campaigns and how they integrate the visitors in the daily activity
- create and share a vision, in conjunction with other cultural entities
- outline the character of a region, promoting either local or international exhibitions, being abstract or concrete, either open for diversity or rigid in what they display

Usually, museums have at least one permanent collection that defines the cultural site – the essence of the main exhibition identifies itself with museum's personality. Besides, other temporary exhibitions are held to educate the public and provide variety. These temporary exhibitions might be either specific to a time frame in history or belonging to an individual. Generally, the exhibits are curated around a main idea or theme to wrap the visitor in a predetermined atmosphere.

How museums decide what collections to display depends on various variables, among the most important being the relevancy, the budget, their long-term vision, as well as market demand. This paper is presenting an architecture capable of recognizing relevant vectors of influence within a group using ordinary devices and proposing an interdisciplinary approach that involves information technology solutions and strategies to monitor and harvest data about visitors in a natural sciences museum. Based on the collected information, several data processing techniques are applied to determine individual and collective characteristics in order to identify those subjects who share common interests. Further, the results might be used for better marketing strategies and more effective communication with potential customers through social media. Nevertheless, the methodology can be extended for more complex scenarios in different economic or social fields.

## **RELATED WORK**

Understanding human behaviors and predicting individual interests and actions has recently attracted much attention, with novel and ingenious technologies integrated to analyze, track and learn from

daily observations. One field, where thought-provoking results have been obtained, is Human-Computer Interaction, where robots or smart sensor grids monitor public venues in order to observe human typologies (Kelley, et al., 2008). For example, humanoid robots have been included in museums (Rashed, et al., 2015), (Shiomi, et al., 2007) and shopping centers to assist and learn about visitors (Kato, et al., 2015), (Shiomi, et al., 2009).

This article is proposing a different approach for achieving the objective of identifying collective interests, relying on common devices that are frequently used in museums, to avoid generating a general surveillance atmosphere that would interfere with normal human behavior. Studies have shown that people who know their actions are monitored tend to behave differently than in unsupervised circumstances (Jansen, et al., 2018), (Bateson, et al., 2006). Compared to the previously mentioned solutions, this concept intends to identify similar individuals within groups and recognize general characteristics for the observed population. Therefore, it is dependent on far less infrastructure, the design is intended for narrower context estimations, particularly targeting collectivities and underlying structures that favor cohesion.

## **METHODOLOGY**

The data collection phase required some technical prerequisites that have to be mentioned first, in order to understand how the values that would be further presented have been acquired.

Previous own academic initiatives fruitfully resulted in designing a microservices architecture around the producer-consumer pattern, where a custom-tailored service collects sensor information from the accelerometer and gyroscope available in a smartphone and stores them in an asynchronous manner in a Kafka cluster, in specific topics. Subsequently, other analysis modules are responsible for iterating the topics, processing the acceleration information and correlating the results with gyroscope details about the angle between the magnetic North Pole and the actual position of the phone at a particular timestamp. In this manner, the software solution behaves similarly to an attitude and heading reference system that is capable of estimating the current orientation of the device and distinguish when the subject is in a motion state. Consequently, estimating the mean step stride of an individual based on his height, the mileage can be successfully determined, and the actual followed path can be displayed on a floor plan.

This architecture has been adapted to record information about the current user in order to simultaneously harvest data from multiple individuals. The details about the user help identify the entries in the Kafka topics, since different instances of the application send HTTP POST requests that end up storing details in a shared repository. Twenty different devices that have access to this software solution have been distributed to the members of a control group inside a museum. For scientific

purposes, the members of the control group were asked to visit the museum and invest time in reading and learning about exhibitions they are interested in, without interfering with other group members. Subjects have had no time constraint for this experiment and have been asked to wear the phone attached to a lanyard, with the screen oriented towards them, in portrait mode, similar to regular wireless telecommunication devices that are available in museums for listening to audio guides. In this way, the data acquisition method has been comparable for every subject, preventing measurement errors. In absence of this requirement, there is a possibility that some subjects would put the phone in the pocket, others will hold it in their hands, some might have it in portrait mode, others in landscape and although the application is designed to consider the orientation and position of the phone while walking, such inadvertences might lead to erroneous measurements.

At the end of the experiment, the data collected have been processed and individual itineraries have been generated, motion sequences and the corresponding timestamps being emphasized. Correctly retrieving the exact location helped understanding when the subjects were in a particular exhibition, while the difference between the motion intervals represented the time spent in exploring or reading. The museum in which the experiment was initiated has twelve different exhibitions, each of them portraying environmental details regarding the flora and the fauna from various regions. In Table 1 is presented an overview of the first three exhibitions where each subject decided to spend the most time, as results from a preliminary processing phase.

| Exhibition name | First choice              | Second choice | Third choice |
|-----------------|---------------------------|---------------|--------------|
| Cavernicol      |                           | G, R          | B, K, T      |
| Extreme         | C, E, I, K, M, N, O       | A, F, S, T    | G            |
| Salt waters     |                           | B             | S, R         |
| Fresh waters    |                           |               | N, Q         |
| Danube Delta    | D, H                      | P, Q          | M, O         |
| Pontic          |                           |               | D, J         |
| Steppe          |                           |               |              |
| Continental     |                           |               | I            |
| Extinct         | A, B, F, G, J, L, P, R, T | D, I, K, M    | C, E, H      |
| Chinese         | S                         | C, E, L, N, O | A            |
| Romanian        | Q                         | H, J          | P            |
| Alpine          |                           |               | F, L         |

Table 1. *First three exhibitions where each subject decided to spend the most time*

## DATA MODELLING

The information collected from the aforementioned experiment might reveal interesting characteristics about individuals in the control group, as well as regarding the group as a whole. But before reaching any thought-provoking conclusion, the harvested raw data must be modeled following a structure.

Usually, software solutions that gather and process information, sooner or later require a mean of modeling and storing the data, for results to be operational and accessible at a future moment in time. Often, the solution that is opted for is a relational database, since the technology is mature and popular enough, there is plenty of research in the field that helped the domain evolve over the years, there are many different software solutions available and the developers community is broad and many possible problems that someone could face when developing a prototype application have already been addressed.

Relational databases work very effective for data models that are structured. Any Relational Database Management System, further referred in this paper as RDBMS, is backed by a database schema. This schema is useful for defining how the information looks inside the database, what kind of format it has, what properties the business model objects have, what relationships exist between different types and details about any existing constraint in the database. Still, such structures are not appropriate for data models that are strongly connected. The misconception comes right from the name, since RDBMS “should” probably be relational. The main problem is that in the RDBMS perspective, the most important actors are the tables that contain data in form of rows and columns and not the relationships between these tables. The term relational is inherited from the mathematical concept of relation, which in Edgar Codd’s relational algebra (Codd, 1970) identifies a table. This tabular format becomes ineffective when the information that has to be stored does not adhere to these principles. If the relationships between the entities are at least as important as the entities, then other database formats might behave better.

For example, the experiment detailed in the previous section contains two different entities, the people that visited the museum and the points of interest within the museum. Analyzed distinctly, without additional details, neither present enough entropy for an in-depth analysis. The entities gather relevance when the relationship between them are taken into consideration. For this particular conjuncture, the relationships are more important than the elements they connect, from an analytical point of view. The purpose of this paper is to understand how the information about the individuals’ behavior inside a public venue can be used to determine characteristic features about the sample population, which in the current context consists of twenty people and how can communities be identified within the population. Therefore, a graph database would be more suitable for this challenge, as the data set acquired before describes a social graph and graph databases prioritize the relationships between nodes and do not require a schema, constraints about a strict format being optional. Moreover, graph databases are optimized for data relationship queries, facilitating easy access to information at any level and in multiple combinations, which in traditional RDBMS would mean complex JOIN queries that require expertise and are time consuming. Different research teams (Khan, et al., 2019),

(Rufin, et al., 2011) stress tested relational and graph databases under similar conditions, their results advocating for the better performance of the latter choice. Further academic initiatives proved that a graph database can handle extensive and complex information with nodes that have billion connections within the structure (Femy, et al., 2016), (Warchal, 2012).

Considering this comparison between the two approaches and bearing in mind the goal of this research, the information acquired in the data acquisition phase has been translated into a bipartite graph with two distinct node types, Person and PointOfInterest, and in between a relationship from a person to a certain point of interest, a structure known in the specialty literature as node-arc-node triple, which further implies a subject-predicate-object determination (Hurlburt, 2015). The relationship holds details about the amount of time a person has spent in that point, while the nodes have labels with informative role. The subjects in the control group are represented by red nodes, labeled with letters from A to T and the points of interest by green nodes, each of them being labeled with an exhibition name. As the edges have numeric values associated that reflect the importance of that relationship in the structure, the outcome is a weighted graph.

The resulted graph is displayed in Figure 1.

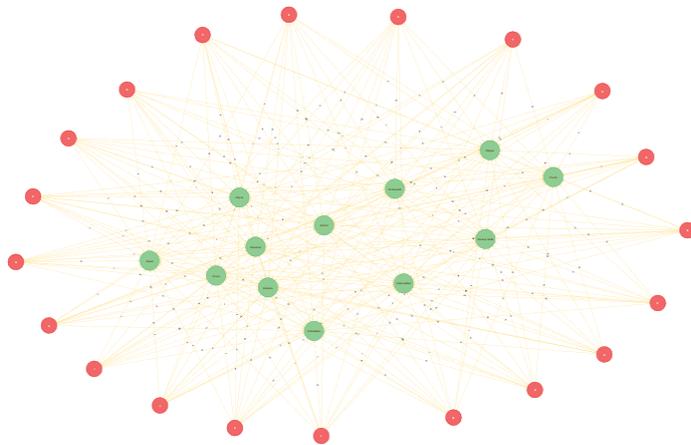

Figure 1. *Graph representation of the data set*

## DATA ANALYSIS AND RESULTS

Having the sample data represented in a graph structure is not automatically bringing simplicity, since in the detailed scenario every person node has interacted with every point of interest because of the continuous layout of the museum, where the visitors are required to pass through all exhibitions before reaching the exit. Therefore, as the software solution collects data about the subjects ten times per second, inevitably the Kafka cluster has recordings that recognize the presence of each individual in every exhibition and the analogous graph is connected. Moreover, each person node has a direct connection with each point of interest and inside this unprocessed structure the information is quite

vague, and no particular conclusion can be drawn just from a visual analysis. To identify some characteristic features that could be valuable in further analyzes, the information has to be refined.

One possible opportunity is to determine the Pearson correlation coefficients between the subjects, to identify individuals with common interests. For weighted bipartite graph structures there are some procedures that facilitate this operation, computing coefficients for each node in relation to any other node of the same kind. The algorithm is symmetric, the relationship between two analyzed nodes being bidirectional. Simply put, if a node A has a certain similarity coefficient K relative to a node B, then node B has the same K similarity relative to A. The resulted coefficient ranges from a negative -1 to a positive +1, where negative values suggest there is a linear correlation between the nodes and while one increases, the other decreases. For a positive coefficient, the relation is opposite, when one value increases, the other follows the trend.

In Table 2 there are the Pearson coefficients obtained for the control group that exceeded a threshold value of 0.5.

| From | To | Pearson correlation coefficients |
|------|----|----------------------------------|

Table 2. *Pearson correlation coefficients between group members*

The Pearson coefficients associated to the data in Figure 1 emphasize different pairs of students that seem to have had similar behaviors during the observation period. For the undertaken experiment, it means that distinct subjects have spent comparable amounts of time in similar points of interest. As a general statistical rule, correlation is different from causation and such limited evidence is insufficient to draw bold conclusions about overall human personality, just because reducing human personality to a model dependent only on one variable would be a mistake. Though, the experiment cannot state that two students with a Pearson coefficient over 0.90 are likely to act similarly in certain circumstances just after this analysis, but rather assume that two individuals that have spent similar amounts of time in similar exhibitions are perhaps passionate about related topics. Concretely, if both students A and E had spent the most time in the exhibitions dedicated to extinct and extreme environments, then would be recommended for a supervisor or teacher to inspire their curiosity in this direction and provide them additional materials regarding the conditions that led to environments extinction, what measures could have prevented such outcomes, as well as to encourage them to identify feasible solutions that could save extreme environments from going extinct, too. It is more likely for the students to invest quality time and efforts in such initiatives, compared to a homework about an exhibition where both were not engaged, like Danube Delta. Such experiments lead to individuals' specialization, outlining in an explicit manner the fields where someone is susceptible to being productive and effective. Extrapolated to a larger degree, in the educational field, such techniques can be used to reveal what topics trigger commitment from a student, which in a causal relationship might lead to a state where a cumulation of factors could influence a career choice, one that the student opts for instead of being influenced by social stereotypes or preconceptions. Such long-term observation procedures can assist psychological or personality tests that usually career counselors give to students in high school to help them understand what fits better their aptitudes.

With such information available, any stakeholder can determine communities within the population, having the necessary tools for creating cohesion by bringing together individuals with similar concerns. Communities thus created are expected to outperform competitors in fields where their observed affinities manifest.

Another graph processing method that is relevant in this context is a degree centrality variation. Originally proposed by Linton Freeman in his research paper "Centrality in Social Networks Conceptual Clarification" (Freeman, 1978), the algorithm is capable of identifying the most popular nodes within a graph, as well as computing standard deviation across the structure or a minimum, mean or maximum degree. Although relevant in the field of social networks processing techniques, degree centrality is not suitable for bipartite graphs, its particularities being valuable just for distinguishing instances with special features within groups of entities of the same kind. An equivalent

of the degree centrality algorithm has been adapted in this paper to determine those points of interest where the people have spent the most time during the museum experiment.

For the control group the most interesting exhibitions have been those intended for extinct and extreme environments with 343, respectively 295 minutes dedicated to reading informative messages, watching presentations and observing environmental details. The complete analysis regarding the monitored population is detailed in Table 2.

| Exhibition   | Time spent (minutes) |
|--------------|----------------------|
| Caves        | 215                  |
| Extreme      | 295                  |
| Salt waters  | 247                  |
| Fresh waters | 193                  |
| Danube Delta | 247                  |
| Pontic       | 182                  |
| Steppe       | 206                  |
| Continental  | 240                  |
| Extinct      | 343                  |
| Alpine       | 224                  |
| Chinese      | 232                  |
| Romanian     | 258                  |

Table 3. *Degree centrality for point of interest nodes*

From these results, several quantitative statements can be elaborated:

- the group has a predisposition towards extinct and extreme environments
- national iconic environments together with pelagic environments describe a secondary cluster, most of the exhibitions that present these environments being second choices for those who appreciated the most the extinct and extreme habitats
- at the opposite pole, environments with reduced diversity, like Black Sea, rivers or steppe, have been easily overlooked

A graphical representation of the museum's floor plan is depicting the areas that each person from the control group considered the most interesting, based on the time spent there.

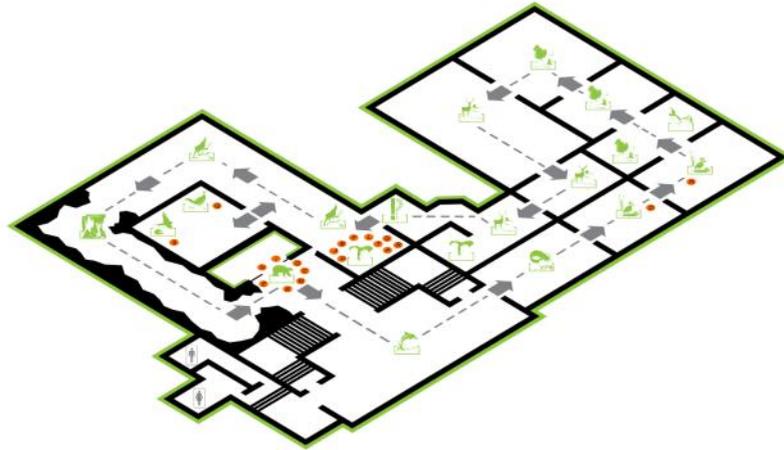

Figure 2. *Most interesting points of interest according to Kafka recordings*

General characteristics at collective level help identifying the most relevant vectors of influence for a predetermined population. Such findings overcome this experiment and encourage extrapolation for larger communities in more varied contexts. For example, a comparable approach applied at a large scale for the customers of a library could reveal what topics are shared by the most citizens within an area. Similarly, the same principles applied in a supermarket could predict food habits that, correlated with additional information about the subjects, are able to determine citizen typologies. Concretely, if the customers aging from 18 to 30 years spend most of the time in the raw, natural, unprocessed, vegan departments, local authorities could assume that younger generations are more preoccupied by their health, which influences the perspective of a longer and healthier life, whilst long time intervals spent in sweets, alcoholic or highly processed food departments should sound an alarm for the concerned actors, as all the aforementioned categories are less beneficial in the long run and contribute to deterioration of health.

To encourage the usage of such solutions, stakeholders can apply gamification methods, providing participants social platforms with scores and prizes for most active users to boost engagement. Also, for commercial scenarios like the supermarket or the library, discounts or gift cards can be offered in exchange for the customers to use the application while inside. Such approaches not only can be used to provide relevant recommendations and discounts for the customers which they are more likely to profit from, but also as a secondary mechanism for identifying acquisition seasonality in the product portfolio.

## IMPLICATIONS

The outcomes obtained from the use case conducted in the natural sciences museum have been further double-checked with both the group members and their tutor, that confirmed the findings were

accurate. As a consequence, such approaches prove effective in identifying particular features and similarities among individuals based on their behavior, rather than directly interviewing them. One major implication of this technique is the generality it provides, being efficient in collecting information from introverts and extroverts alike, characteristic which in traditional interviews usually lack, as the introverts on the one hand avoid being open to unfamiliar interviewers and on the other tend to present a shallow version of reality, fearing from being stigmatized.

A second implication is the light architecture of the system that perfectly scales up with twenty different devices that simultaneously gather data, without involving extensive hardware resources. The entire processing is supported by an average price laptop, which allows information technology enthusiasts to experience without depending on cloud infrastructures.

Last but not least, this is one of the first initiatives interested in knowledge acquisition that comprise the environment where the data is produced, and the methods required for information harvesting and processing. Most of the social graph experiments so far rely on information collected from public APIs exposed by social media platforms. Differently, this paper would like to encourage cultural institutions to model their daily activities, to identify their potential strengths and weaknesses and take informed, data backed decisions.

## CONCLUSIONS

This paper has detailed several use cases of a software architecture developed from previous own research initiatives, capable of precisely determining indoor location in public venues. Such applications aim to assist people in indoor navigation and provide complementary services, derived from the knowledge acquired in the process. In a business-oriented environment, the techniques described in the previous chapters could be adapted to supply customers a recommendation engine that is able to provide suggestions based on observed patterns on different subjects that have similar behaviors. Such recommendation engines have already been adapted by the most innovative online sellers worldwide, being programmed to harvest information about the customers and to process the acquired details, outlining personal profiles and preferences. These profiles are further enriched and refined to provide custom-tailored suggestions, advertisements or promotions that exploit the user's affinities, interests and needs.

In a digitalized world, where data has become the most valuable asset (Economist, 2017), businesses that are capable of understanding their customer profiles, foresee and adapt to future changes and adjust their services and products accordingly are those to impose, to gain market share and capitalize. Graph databases are a versatile technology that simplifies data processing operations for large data banks describing social networks and provide powerful and effective algorithms for complex data

retrieval. Pearson correlation coefficients and degree centrality methods exposed in this paper identified collective features for the control group, as well as clusters of individuals who share common interests, which could trigger further individual specialization processes, providing subjects with materials and tasks that could challenge their aptitudes and drive them out of their comfort zone to acquire more knowledge and perform better.

In different setups, the same principles can identify key components to be exploited in marketing campaigns, delivering customers personalized messages that target their interests and needs, with increased return of investments and high commitments rates. Social analytics are expected to improve services quality, increase customer satisfaction and provide better financial results.

## ACKNOWLEDGMENT

This paper was co-financed from the Human Capital Operational Program 2014-2020, project number POCU / 380/6/13/125245 no. 36482 / 23.05.2019 "Excellence in interdisciplinary PhD and post-PhD research, career alternatives through entrepreneurial initiative (EXCIA)", coordinator The Bucharest University of Economic Studies.

## SKIN AS A COMMUNICATION MEDIUM

Ognjan, Mira; Franov, Morana; Ercegovic, Petra

University North, Koprivnica, Croatia

### ABSTRACT

Scientific research has confirmed that tattooing as a means of personal expression has been a ritual practice for centuries in many cultures. Tattoos had different meanings in different time contexts, both from the inner perspective of the person "wearing" the tattoo and from the outer perspective of the observer. Today, it is impossible to find a football player, singer, actor or athlete without a tattoo on the body. This trend has been embraced by many individuals and introduced into their daily lives as an integral part of their style.

This paper aims to present the most significant results of worldwide research related to the phenomenon of tattooing, starting from motives that encourage individuals to such body modification, research studying the lifestyle of tattooed people and their chances in the labor market and all the way to research that brings tattooing into correlation with mental illness.

The results of the research showed that there are a dozen basic motives that lead individuals to get a tattoo, but in recent research, the largest number of respondents state that they get a tattoo to feel more attractive and appealing. Visible tattoos reduce the possibility of employment for jobs where you work with clients, like cashier or teacher jobs. Recent research has shown that there is no significant correlation between tattooing and mental illness.

The purpose of this paper is to contribute to a better understanding of the communicative aspect of the tattoo phenomenon.

*Keywords: tattooing, body modification, social perception of tattoos, tattoos and the labor market*

### 1. INTRODUCTION

The research aims to collect and summarize as much available scientific research on the phenomenon of tattooing to better understand the communication aspect of the phenomenon of tattooing. Tattoos have fascinated humanity for centuries in various cultures and social strata (Oanta, 2014). From ancient Egyptian, Greek, and Roman culture, through Maori tribes to modern-day society, tattoos have been used to emphasize beauty and uniqueness, mark affiliation, and sometimes even to mark, shame or punish. Given the rise of popularity of tattoos, they are taking back their historical purpose of providing the observer with the information about a person which makes them a tool of the nonverbal communication. Tattoos as a form of communication, have not been researched at length that fits the

upward trend, thus providing an opportunity to better determine communication aspects of the phenomenon of tattooing in the field of communication, and contribute to the said field.

Probably the oldest book dealing with the phenomenon of tattooing was published in 1590 entitled "A Brief and True Report of the New Found Land of Virginia" by Thomas Harriot. The pictorial representation of the tattoos was made by the Belgian artist Theodore de Bry. As Bry never set foot on American soil, he based his engravings on drawings and sketches he received from more gifted colonizers. In his engravings of the Indians, he paid special attention to their tattoos and other ways of adorning the body. Although his depictions have no special ethnographic value today, as the author himself has never seen the protagonists of his works live, his work is historically important because his engravings published in this book are also the first published European depictions of tattooed people that inspired numerous subsequent discussions and studies on tattoos (Schildkrout, 2004).

The first serious study of tattoos was published under the title "Anthropometamorphosis" (1653), by the British Protestant physician John Bulwer, who strongly condemned any body modification, and considered the tattooed body of a native a sign of savagery and incivility, while a pure body was a characteristic of a civilized Christian. Such an attitude about tattoos will be present in the European public for the next few centuries. "The tattooed savages/pure civilized dichotomy easily entered the European discourse at the time simply because it was useful, and it will take several hundred years to develop a somewhat more objective and scientific approach" (Dorotka, 2017).

British anthropologist Anne Walbank Buckland reflects on tattooing in the past in her article "On Tattooing", saying that this form of body decoration was probably accepted and widespread at a very early stage of human development. The author emphasizes that the prevalence of tattooing is declining with the progress of civilization and the beginnings of the use of clothing as a less painful way of decorating the body (Buckland, 1888). This article, among other things, deals with reflections on the role of tattoos in individual societies and in different cultural discourses where tattoos can have an initiating, magical and status role (Buckland, 1888).

In modern Western societies, as early as the 1970s, tattoos were a cultural taboo, typically associated with individuals from the margins of society such as prisoners, gang members, and other members of marginalized and subcultural groups. Tattooing has become planetary popular in the last ten years. Individuals communicate with their surroundings through tattoos. A tattoo is a driver, a mediator in the communication of symbols. According to Wilson (2008), tattoos are active, in moments of exposure to others they project symbols to others. Tattooed skin becomes a medium through which an individual can convey his experiences, attitudes and his view of self and thus communicates with his environment. Tattoos polarize the opinions of people who are either extremely positive or extremely negative and very rarely neutral.

## 2. METHODOLOGY

The methodological approach of this research was qualitative, and the main technique of data collection and analysis was the analysis of content from the available literature review. PRISMA literature search methodology was used in the preparation of this paper. The following exclusion/inclusion criteria were taken into account when conducting the research:

- years included in the search period 1970 - 2019;
- search keywords present in the abstract and title;
- duplicate removal;
- filtering importance, so that books published in recent times, scientific articles, national studies and other available researches were considered the most important.

The search criteria were combinations of the following keywords: tattoo(s) or tattooing, motifs for tattooing, social perception of tattoos, labor market and tattoos, adverse effects/health reactions of tattoos. The final number of abstracts read in recently published books, scientific journals and national reports, with the required keywords is 94. After that, all texts published before 1970 were taken as historical, and the content of the paper included research published in 13 scientific articles.

The research sought to find answers to the following research questions:

1. What are the basic motives for body modification with tattoos?
2. Can tattoos be associated with a particular lifestyle of the people who own them?
3. Are the chances in the labor market the same for tattooed and people without tattoos?
4. Is there a correlation between tattoos and the mental health of people having them?

With those questions in mind, the goal of this research is content analysis of the chosen articles with the purpose of understanding communication aspects of the tattooing phenomena.

## 3. RESEARCH RESULTS AND DISCUSSION

Extensive research on recent tattoos was conducted by the German agency *Dalia Research GmbH*, whose main activity is conducting social research. The agency conducted the survey by surveying respondents from Argentina, Australia, Brazil, Canada, Germany, Denmark, Spain, France, UK, Greece, Israel, Italy, Mexico, Russia, Sweden, Turkey, USA and South Africa. The research was conducted through a survey in April 2018. on a sample of 9054 respondents. Respondents were accessed via the Internet. The following are the key conclusions of the conducted research (Dalia Research GmbH, 2018). Italy has the highest percentage of tattooed people, i.e. 48% of respondents. Italy is followed by Sweden where 47% of respondents are tattooed and the USA with 46% of tattooed respondents. Israel has the lowest percentage of tattooed people among respondents (25%). As for the number of tattoos, respondents from the US have the highest number of tattoos so the median is approaching the number of 4 tattoos.

Greece has the lowest median number of tattoos among respondents and it is 2.5 tattoos. Among respondents who have tattoos, as many as 45% are between the ages of 30 and 49 while 32% of respondents are between the ages of 14 and 29. When asked if they regret getting a tattoo, as many as 72% said no. Based on the research by the German agency *Dalia Research GmbH*, it seems that tattooing has turned into a socio-cultural phenomenon, which is spreading in the modern world like an epidemic. Although it seems that tattooing is still not fully socially accepted, decorating the skin with tattoos has become a part of everyday life, and it is chosen by a large number of people, regardless of gender, age, social status or level of education.

Body tattooing throughout history has been inspired by the motifs of a religious, ritual or aesthetic character (Rubin, 1988). It has been present at different stages of civilizational development, in different cultures and on almost all continents. Body decoration with tattoos has survived to the present day, and during different historical periods, it has been subject to fashion and trends, just like clothing, footwear or jewelry. What are the motives of decorating the body with tattoos in the modern world? In an article published in the journal *ScienceDirect* (Wohlrab, et al., 2007), the 10 key motifs that lead individuals to get a tattoo are systemized. The insights gained by Wohlrab et. al. are a summary of research by numerous authors.

The first motif is related to fashion, beauty and art. Thus, some people get tattooed because they believe that the tattoo will be a fashion accessory that will complement their fashion expression, or they consider the tattoo to be a work of art on their own body (Stirn, 2004b). One of the motives for tattooing is to emphasize one's own identity, i.e. the individual characteristics by which a person wants to be distinct, recognizable and distinguished from others (Milner & Eichold, 2001). The motivation for tattooing can be different life stories of people who experience personal catharsis through this act or consider it a way of taking control of their own body (Caliendo, et al., 2005). Very often abused people "fix" their body through tattoos and this leads to self-healing (Stirn, 2004.b). Tattooing is a way of proving courage (Atkinson & Young, 2010). Stirn (2004b), on the other hand, believes that tattooing can be a reflection of self-destructive intentions. Very often tattoos are a sign of belonging and loyalty to a group or subculture (Milner & Eichold, 2001). Tattoos are very often also proof of lasting devotion and love to a person or group. Tattoos can also be a way of expressing rebellion, for example, adolescents towards their parents or rebellion towards imposed value systems (Stirn, 2004a). Tattoos inspired by religion, spirituality, and cultural affiliation are also very common (Jeffreys, 2000). Authors such as Vale and Juno (1989) believe that tattoos are addictive. During tattooing, due to the painful penetration of the needle into the skin and strong motivation to make a tattoo, endorphins are secreted, which leads these people to repeat tattooing. Many people with a large number of tattoos state that the tattoos remind them of the events, experiences, and value systems that moved them at the time of the tattoo.

The inspiration for making a tattoo can often be a desire to emphasize one's sexuality and a person's belief that they will be more sexually attractive with tattoos (Fried, 1983). Some people make tattoos very impulsively and do not have any special reasons for it, while others know how to make tattoos while under the influence of alcohol and drugs (Friederich, 1993).

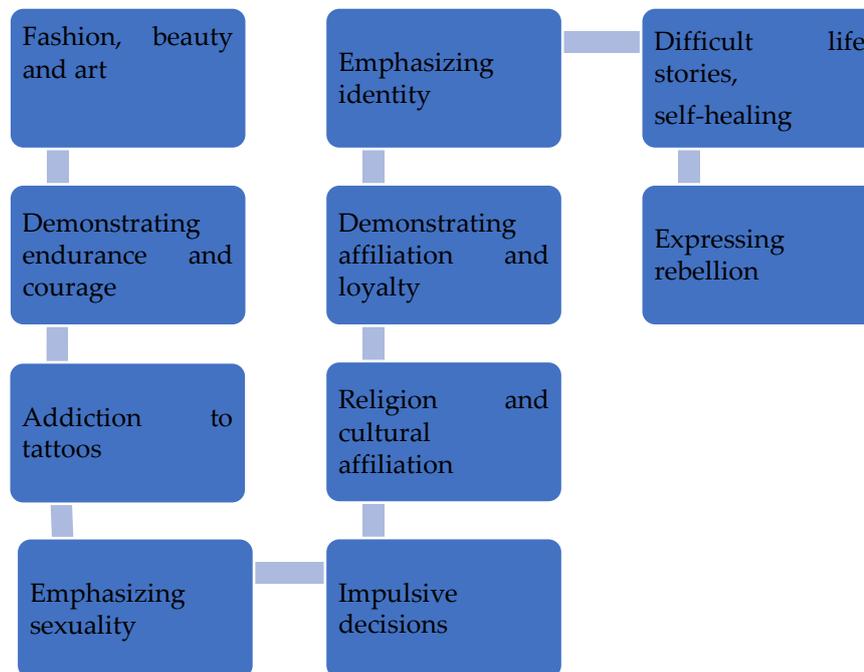

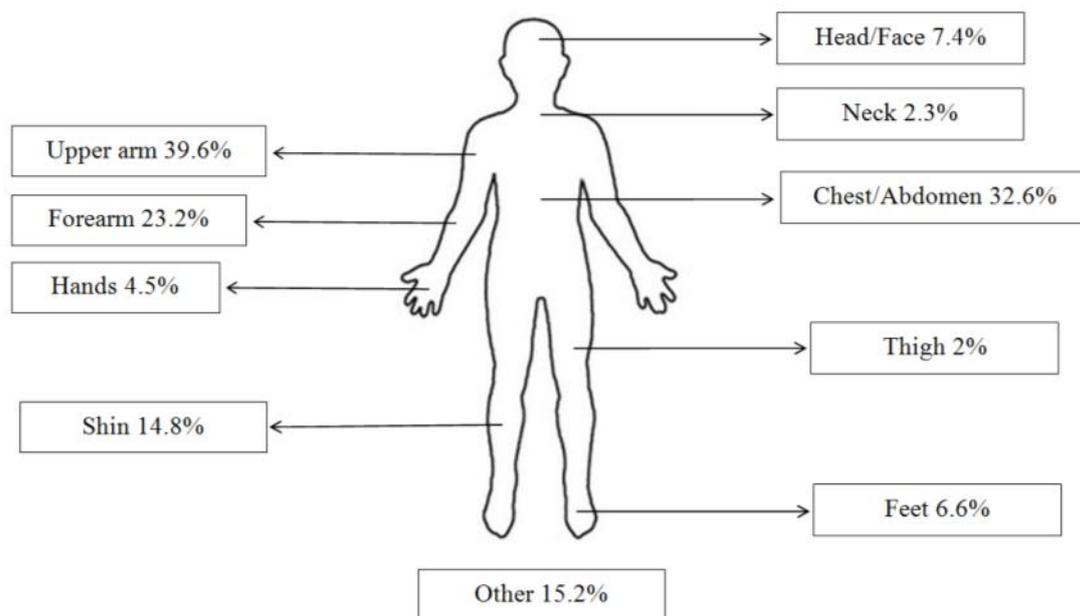

Figure 1. *Ten Motivational Reasons to Make a Tattoo* (Wohlrab, et al., 2007)

The following research was conducted by *The Harris Poll Agency* (2016). The survey was conducted online in the U.S. from October 14 to 19, 2015. among 2,225 respondents over the age of 18. Data on age, gender, race/ethnicity, education, region, and household income were weighted where necessary to align with their actual population proportions (Shannon-Missal, 2015). As part of this research, tattooed respondents were asked the question: "Compare your feeling about the tattoo with the situation if you didn't have a tattoo". One third (33%) of adults with a tattoo stated that the tattoo made them feel sexy and that the tattoo made them attractive (32%). Just over a quarter (27%) say they feel more rebellious, and 20% of respondents feel more spiritual because of a tattoo. Fewer respondents stated that a tattoo makes them feel more intelligent (13%), 13% of respondents have a sense of respect, 10% of respondents state that a tattoo makes them feel more employable and 9% of respondents feel healthier. Most respondents state that having a tattoo is an immeasurable feeling. The study indirectly suggests 10 motivational categories according to Wohlrab, et al. (2007).

*The Harris Poll* study also followed the trends in the feelings that tattoos created in respondents according to surveys from 2003, 2008, 2012 and 2015, which showed that most respondents feel attractive and sexy because of the tattoo, and it can be concluded that one of the basic motives of the respondents for making tattoos in recent times is fashion, beauty and emphasizing sexuality.

A scientific article entitled "*Tattoos, Lifestyle and the Labor Market*" was published by the *Forschungsinstitut zur Zukunft der Arbeit* in Bonn. (Dillingh, et al., 2016). The article based its stronghold on a panel survey conducted since 2013 through a monthly longitudinal survey of 512 respondents. Respondents were accessed via the Internet. The panel was based on a sample of Dutch households taken from the census. The research was conducted by *CentERdata* (Tilburg University, The Netherlands). This study looked at the relationship between visible tattoos with work status, individual's income, subjective feeling of health, and the use of drugs and opiates. During the research, a control group of subjects who were not tattooed was formed. Tattooed subjects most often had tattoos on their upper arms, abdomen, and forearms.

**Figure 2.** View of the tattoo location of the respondents ( $N = 512$ ), (Dillingh, et al., 2016)<sup>1</sup>

<sup>1</sup> Note: The sum of the percentages in the figure exceeds 100% because some respondents had tattoos in multiple places.

Respondents' tattoos contained text, very often names, in 25% of cases. The most common tattoo motifs were animals, hearts, stars, crosses as well as tribal or Celtic motifs. Many tattoos symbolized themes like love and family, freedom and religion. Several respondents reported that their tattoos were associated with an important life event, either positive (such as the birth of a child) or negative (such as the loss of a loved one) (Dillingh, et al., 2016).

Descriptive statistical processing of tattooed subjects with visible tattoos and about 2000 non-tattooed subjects was performed (Dillingh, et al., 2016). The survey included the working active population and the disabled. Pensioners, housewives and students were excluded from the research because of their insignificance for the labor market. The average age of the examined non-tattooed persons was 46.30

years, while the tattooed respondents were younger and their average age was 42.28 years. There were more disabled and single people among the tattooed respondents. Also, tattooed respondents have fewer children in the household, and are less likely to own their own homes. Tattooed respondents are more likely to emphasize their urban mentality and have a lower level of education. Tattooed respondents were more likely to be obese than non-tattooed respondents. Non-tattooed respondents have a better self-assessment of their health condition, they visit psychologists and psychiatrists less often. Among non-tattooed respondents, there are fewer smokers and users of sedatives, soft drugs, ecstasy and hard drugs. Tattooed respondents were more likely to feel anxious, sullen and depressed than non-tattooed respondents. Tattooed respondents were significantly more prone to all types of risks than non-tattooed ones.

A study published by the *Forschungsinstitut zur Zukunft der Arbeit* in Bonn proves that the tattooed population is still, in a wide range of demographic characteristics, significantly different from the non-tattooed population. Regression analyses showed that there is a particularly strong correlation in self-assessment of health status, where tattooed individuals rated their health status significantly worse in comparison to non-tattooed individuals. Having a tattoo is still correlated with a lower level of education. No evidence was found of the (negative) impact of visible tattoos on the income. Research has found that people with a tattoo are less likely to live with a partner and use drugs and opiates more often.

*The Harris Poll* (2016) study also addressed the social perception of people with tattoos. 40% of respondents felt that people with tattoos were more rebellious than people without tattoos. On the other hand, 36% of respondents thought that people with tattoos were less attractive than people without them, 33% of respondents thought that people with tattoos were less sexy, and a third believed that tattooed people were less respected than non-tattooed people. 23% of respondents consider people with tattoos to be less intelligent and less healthy (22%) and less spiritual (20%).

Different aspects of physical appearance such as height or beauty can significantly affect employability (Watkins, 2000). A particular example of emphasizing identity is body decoration with tattoos (Akerlof & Kranton, 2000), which could have a significant impact on an individual's employability. The subject of this research was also the objective and subjective visibility of tattoos. The visibility of tattoos is important, for example, during a job interview. Only a visible tattoo can be relevant to a potential employer. The most visible tattoos are on the face, head, neck or arms. These tattoos are classified as objectively visible in this study.

Rahul (2018: 23-24) in his paper entitled *Perceptions of visible tattoos and piercings in the service industry* explored the employment policy towards tattoos in various multinational service companies. His research showed that airlines and the police are the most rigorous employers when it comes to visible

tattoos. There is obvious discrimination of candidates with visible tattoos. The possibility of latent discrimination of tattooed candidates by employers who do not deal with tattoos in the employment criteria could not be excluded. There is a possibility that candidates with visible tattoos will be eliminated at the job interview with a completely different explanation (Watkins, 2000).

Timming, et al. (2015) assessed the impact of body modifications on employment opportunities in their study. The research was conducted through an experiment in which they selected four male and four female individuals, i.e. eight individuals who served as a "control" group. Tattoos and piercings were added to each of these faces using *Photoshop*. The tattoos were strategically placed at the bottom of the neck so that they are noticeable but not obvious.

*Figure 3. Example of an image from an experiment with an original photograph, a photograph with an added piercing, and a photograph with an added star tattoo (Timming, et al., 2015)*

The experiment examined 120 people who had the role of employment managers. Respondents were randomly shown pictures of 8 selected faces in three variants (no body modification, with a tattoo and with a piercing). Respondents had to decide using grades 1-7, which person they would rather hire (1 = very unlikely to 7 = very likely). Respondents were introduced to the same persons twice. In the first block of the survey, they were asked: "How likely is it that the person in question would be employed as a cashier, a teacher or a waiter?". In the second block of the survey, respondents were asked, "How likely is it that the person in question would be employed as a cook, a factory worker, or a night watchman?"

Research results have shown that tattoos and piercings have a significant impact on employability. The authors of the study proved those body modifications significantly reduce the chances of employment. This is especially emphasized in jobs related to working with clients such as the jobs of a cashier, a waiter or a teacher. Research has proven that body modifications carry a stigma that causes prejudice among potential employers.

In the early 20th century, doctors and psychiatrists associated tattoos with character deficits. In 1934, psychiatrist Parry published a scientific book entitled "*Tattooing among Prostitutes and Perverts*". The title alone speaks enough about the official psychiatry's attitude about tattoos at that time. Psychiatrists (Lander & Kohn, 1943) present that there is a strong correlation between tattoos and psychopathology in their research. Scientific research conducted in the 1950s and 1960s has largely presented evidence that having multiple tattoos is associated with personality disorders. Scientist Gittleson et al. (1969) conducted research on 720 general and psychiatric patients. 111 of them were tattooed and 609 were not. Upon completion of the study, they reported that an increased incidence of personality disorders was observed in tattooed patients. Personality disorder was reported in 25% of tattooed patients and only in 8% of non-tattooed patients (Gittleson, et al., 1969). Such trends in the research were recorded until the 1990s. The prestigious scientific journal *Psychiatry Journal* published a series of articles that presented the concept that tattooing and other body modifications are manifestations of borderline personality disorder (Inch & Huws, 1993). It is very difficult to retrospectively assess the extent to which the social stigma of tattoos and other body modifications influenced the objectivity of scientific research at the time.

A significant turn in scientific research regarding tattoos is brought about by scientists Rooks, Roberts and Scheltema (2000). The purpose of their research was to examine the relationship between tattoos and the reason for coming to the hospital emergency department. Reasons for the arrival of patients were grouped into three groups: injury, illness or psychiatric problems/addiction. All patients were interviewed about attitudes and personal experience with tattoos. The demographic characteristics of tattooed respondents were also assessed in relation to non-tattooed ones. In two 24-hour periods, 294 patients and 289 emergency service employees were examined.

In the 16-35 age group, 35% of patients and 19% of staff had tattoos. In the 36–50 age group, 28% of patients and 11% of staff had tattoos, and the 51–65 age group had a similar percentage: 6% of patients and 5% of staff had tattoos. Age was a significant predictor of attitudes about tattoos. Younger people had a more positive attitude about tattoos. Significantly more smokers (31%) than non-smokers (13%) were tattooed. Tattooed people had a lower level of education. Gender was not significantly associated with tattoo ownership or the number of tattoos a person had. No connection was found between the tattooing and the reason for coming to the emergency department. Thus, no correlation was found between tattoos and mental illness.

Likewise, the results of a study conducted by Giles-Gorniak, et al. (2016) showed that the mental health of the respondents was not correlated with modifications on the body.

#### 4. CONCLUSION

Results for the first research question regarding the motives for body modification with tattoos, from Rubin (1988), Wohlrab et. al. (2007) and *The Harris Poll Agency* (2016) has come to the show that the primary motive is using tattoos as a form of emphasizing or communicating to others what one, as an individual, values. Even though those motives are largely personal, they have some similarities as wanting to enhance physical appearance, show unique identity traits, religious affiliation, spiritual values etc. From the available research, it can be concluded that the largest number of tattooed people find tattoos attractive and that they emphasize their sex appeal. This implies that the primary motives for tattooing are fashion, beauty and emphasizing sexuality.

Second and third research question were analyzed through research by Akerlof & Kranton, (2000), Rahul (2018: 23-24), Dillingh, et al., (2016) and Timming, et al. (2015) which led to the conclusions about the difference employment chances for tattooed and people without tattoos, and consequently related differences in lifestyle. It is concluded that people with visible tattoos that cannot be covered with clothing have a different lifestyle than people without such tattoos. Research has shown that the tattooed population, in a wide range of demographic characteristics, is still significantly different from the non-tattooed population. Regression analyses indicate that there is a particularly strong correlation in self-assessment of health status, where tattooed individuals rated their health status significantly worse than non-tattooed. No evidence was found of the (negative) impact of visible tattoos on income. Research has found that people with a tattoo are less likely to live with a partner and use drugs and opiates more often. Tattooed people with visible tattoos and non-tattooed people do not have the same opportunities in the job market. It is clear that airlines and the police are the most rigorous employers when it comes to visible tattoos. There is obvious discrimination of candidates with visible tattoos. Tattooed people are significantly less likely to get a job related to working with clients such as a cashier, a waiter or a teacher. Research has shown that body modifications to perform these jobs carry a stigma that causes prejudice among potential employers. The possibility of latent discrimination of tattooed candidates among employers who do not deal with tattoos in the employment criteria is not excluded. There is a possibility that candidates with visible tattoos will be eliminated at the job interview, with a completely different explanation. Research shows that tattoos and piercings have a significant impact on employability and that people with tattoos are most often perceived as rebellious.

Last research question examined the link between mental health and tattoos. It has long been suggested through scientific research that a correlation between mental health and tattoos exist. However, the rise in the tattooing as a trend has shown that the said theory is due for a revision. Recent research, for instance Giles-Gorniak, et al. (2016) has shown that tattooing is not directly related to mental illness, although scientific research conducted in the 1950s and 1960s offers evidence that having more tattoos

is associated with personality disorders and mental illness. Such trends in the research were recorded until the 1990s. After that period, research proves that mental health of the respondents is not correlated with body modifications.

Tattooed skin is a medium through which an individual conveys his experiences, attitudes and his view of self and thus communicates with his environment. Tattoos have existed for thousands of years, they have gone from general acceptance to religiously and socially motivated stigma, and with the popularization of tattooing, they have begun to return to the sphere of socially acceptable expression of the identity and interests of the individual. The needs of individuals to stand out in society, to express their identity, spirituality or affiliation are becoming more frequent and pronounced, especially among the younger population. The reasons for this can be related to the fact that today's media content has a very pronounced visual element of the message, and this is what tattoos really are, a visual messages, so the increase in the popularity of tattoos is not unexpected. With that in mind, rise of the tattoos as a communication medium has opened new opportunities for research especially because the change in society perception of tattoos, development of different tattoo styles and general accessibility and rise in the hygienic standards of tattoo parlors has resulted in more and more people deciding to have a tattoo. Tattooing is a very interesting communication phenomenon that provides a lot of room for further research and discussion.

### ABSTRACT

**Purpose:** The research is scrutinizing how transparency and public engagement are impacting the success odds of a collaborative legislation initiative. It is generally accepted that engagement and transparency are key ingredients when aiming to meet citizens' needs while also reducing the gap between a community and how its life is shaped through state mechanisms. However, participatory methodologies are still under experimentation and little can be said based on more than individual case studies.

**Design/methodology/approach:** The present research analyses two strings of collaborative legislation initiatives, based on CONSUL and, respectively, DECIDIM methodologies, issued before 2019, the results highlight a more complex web of relations between factors which drive the success of participatory legislation.

**Findings:** According to the results, nor public engagement or the degree of transparency were found to significantly predict the success of a collaborative law document, when success is defined as the chances of such a collaboratively produced document to get processed and adopted by a local government. While such results should be cautionary interpreted, they still trigger a more nuanced discussion, as the success of a collaborative legislation initiative seems to be related with processes which mirror the institutional *modus operandi*, by bringing specialists at work, and not by harvesting the collective knowledge within a community.

**Originality/value:** The authors examine collaborative legislation processes from the viewpoint of governmental transparency and citizens' engagement. The study permits an enhanced understanding of collaborative legislation initiatives and how they function as well as their linking variables to public involvement and participation.

*Keywords:* transparency, citizen law making; entrepreneurial initiative; public participation; CONSUL methodology, DECIDIM.

## INTRODUCTION

### **Literature review: transparency and deliberation in public decision making**

Transparency and its main objective public participation has increasingly becoming an international issue for more and more countries. Being described as a worldwide phenomenon, transparency is both an old and a new concept. If publishing public information on public institutions' websites is novelty seeking, the key idea that others behaviour is influenced when they are watched, has been activated long time ago. As Lotte Feinberg suitably recalled: "for democracy to work, citizens must have access to information about what their government is doing and how decisions have been reached" (Feinberg, 1997).

The aim of this study is to gain a clearer understanding on how transparency and public engagement are impacting the success odds of a collaborative legislation initiative. A transparent society, as "one in which there was no space for the sort of social darkness in which injustice or unhappiness would breed" was part of French revolutionaries' ideas (Hood, 2006). English philosopher, Jeremy Bentham regarded transparency as the key to the prevention of abuses of power, defining secrecy as an "instrument of conspiracy which ought never to be the system of a regular government" (Meijer, 2014). Decades later, sociologist Amitai Etzioni (2010, 389) affirmed that "transparency is often even regarded as a self-evident good in society".

Nowadays new technologies facilitate transparency (Margetts, 2006) even in authoritarian states such as China where "transparency is considered to be crucial in forging a connection between citizens and government" (Tan, 2012). In this type of government, the ability of citizens and civil society to hold the state to account (Lorentzen *et al.*, 2010) is often directly proportional to the autonomy of civil society or in such case the lack of it. In 2009, when president Obama issued the Open Government Directive, many US agencies had to plan how they will adopt a culture of transparency in the way they operate (McDermott, 2010). This framework for open government brought the promise of developing more trustworthy and transparent institutions by using innovation and new technologies. But the question is to which extent citizens' engagement is assured when they have the opportunity to monitor and influence government processes through access to decision-making arenas and public information (Meijer, 2013). In a very simple, but effective scheme (Meijer *et. al.*, 2012) participation is seen as open access to decision-making arenas and transparency as open access to government information mentioning therefore publicity as the essential link between transparency and participation. A collaborative process has the ability to transform learning from being not just an individual experience, but a very suitable occasion to activate citizens' minds in a collective effort (Innes and Booher, 2000). Increasing transparency and public participation based on collaborative decision making

methodologies may be a way of “strengthening people’s capacity to act upon the available information” (Lindstedt and Naurin, 2010).

## **HOW CONSUL AND DECIDIM WORK IN ORDER TO ENABLE PUBLIC PARTICIPATION AND COLLABORATIVE LEGISLATION**

As stated in CONSUL Use Guide version 0.16 (n.d), CONSUL is a software that was developed by Madrid City Council to facilitate citizen participation. Its main scope was to enable a direct system of communication with the city administration that could allow citizens to make proposals for action to be supported by other users, express their decision on particularly significant issues of the institutional action, participate in the process of developing regulations or decide on the destination of part of the institutional budget. Adaptable to any specific need, it has been designed in a totally configurable way so that the different processes can be activated or deactivated, and configured in different ways. One of the participation processes that can be carried out in CONSUL, besides Citizen Proposals, Debates, Voting or Participatory budgets is Collaborative Legislation. This component allows citizens to participate actively in the drafting of legislation and city action plans. In the section where are managed the processes of collaborative legislation, in CONSUL Project Administration Guide are explained the three different phases used: debate, proposals and drafting. In the debate phase the local governments (LG) can open several questions expecting open answers from the users who also can rate other's users answers. In what regards the proposals phase, it allows the users to write proposals on the issue and also support other users proposals. Last, but not least the drafting phase which allows the text's publishing. In this case, users can select any part of the text, make comments to it, and rate other comments. When clicking "Create new process" one can be defined which phases will be active (click in the "enabled" checkbox of each phase), the start and end dates of each phase, the information that will be shown in the web page of the process such as title, summary for the list of processes, basic description and additional information. This kind of tool makes it possible to “design more complex participation processes with different phases of participation that are defined specifically for each process. These phases may include open debates, selection of proposals, proposal and prioritization of measures, comments on texts, etc.” (CONSUL User Guide, n.d)

DECIDIM (General description and introduction to how DECIDIM works, n.d.), the other methodology which shaped collaborative legislation processes, is a digital platform for citizen participation aimed to “reprogramme” democracy. It can be used by a public or private organisations like city councils, associations, universities or NGOs. Its main objective was to configure spaces for participation allowing participants to make proposals and decisions using multiple available components such as face-to-face meetings, surveys, proposals, voting, follow-up of results, comments etc. The participatory components

which enable participation on DECIDIM are: *comments, proposals, amendments, votes, results, debates, surveys, sortitions, pages, blogs, newsletters and meetings*. Other components that build on top of basic components are: *participatory texts, accountability and conferences*.

Within the present study, only processes related to collaborative legislation were scrutinized in order to highlight how their success is impacted by public engagement and the level of transparency in communicating the results of the public consultation.

## METHODOLOGY AND RESEARCH DESIGN

Several quasi-structured interviews were conducted with 17 public servants engaged in designing, coordinating or conducting participatory processes in Madrid. All interviews were held in May, 2019 and the overall conclusions reflected that collaborative legislation is a tedious process, triggering lower engagement among citizens, when compared with participatory budgeting or voting. Also, most of the respondents pointed out that citizens get distressed by the perceived efficacy of participation, understood either in terms of adopted public decisions reflecting their views, or as observable change in immediate, concrete reality. Most of the interviewed public servants reported that overall citizens' perception over participatory process improved as participants saw that public decisions accurately reflected their input. As such, the status of a collaboratively developed piece of legislation - as either unprocessed, under processing or adopted - was considered a fair indicator for the efficiency of a crowd-law initiative, along with clearly highlighting citizens' input considered to be useful for drafting a public regulation. To measure the last indicator, all public documents associated with crowd-law initiatives were scrutinized in order to spot reports which explicitly point out to citizens' ideas or commentaries which were considered significant for drafting a public project.

By indexing all crowd-law initiatives launched in Madrid and Barcelona before 2019, a set of 80 cases was computed. 61 cases were indexed for CONSUL method and 19 for DECIDIM.

The variable indicating the success of the initiative was established as the status of the public document collaboratively developed. The categorical variable "**Status**" was computed with three levels, as follows. Level 1=0 or "unprocessed" was ascribed if the government board didn't issue any positive or negative report on the document compiled after participation. Level 2=1 or "under processing" was defined for cases when the government board issued at least one report for the document compiled after participation. At last, level 3=2 or "adopted", indicating complete success, was defined for situations when the document was approved by the City Council Plenary.

To measure the clarity of the citizens' input within the final document, the "**Report**" variable was computed, with two levels. Level 1 = 0 was defined if no public document specifically highlights which ideas or comments were considered valuable for drafting the project. Level 2=1 was computed if such

document was issued. Additionally, for further exploration, other variables were computed, as follows. **Public Engagement** was measured and defined as the number of citizens' public comments or proposals, for each case of collaborative legislation initiative. The number of comments or proposals was computed, and not the number of persons who took part in a process, because it better reflects the amount of citizens' contribution to a public project. All cases were classified according to the methodology used, be it CONSUL based or DECIDIM based, respectively, and the variable "**Methodology**" was defined as such, with two levels, accordingly. To discriminate between possible different effects of the participatory type of engagement, the following variables were created. "**Ideas Contribution**" accounted for instances when citizens were invited to contribute with comments or proposals. "**Collaborative Editing**" was computed to register situations when citizens were invited to directly draft the text for a public decision. "**Direct Meeting**" accounted for cases when a public document was developed through group meetings and citizens were invited to take part. All three variables were defined with two levels, with level 1 = 0, if such exercise wasn't run, and level 2 = 1, if the exercise took place.

An exploratory analysis was conducted at first, to check for differences between the two methodologies and possible relations between variables. A Mann-Whitney Test and Spearman Correlations were applied. Then, factors which could influence the success of the collaborative legislation initiative were explored, by conducting logistic multinomial regressions. Several hypothesis were investigated.

First, we checked if the level of engagement has any effect on the success of an initiative. High levels of public engagement is supposed to put pressure on authorities, so that the collaborative output could be expected to be more readily processed and approved, compared with situations of low engagement. However, high levels of engagement could also give birth to high volume of data that authorities could find it difficult to process. Secondly, it was tested the assumption that highlighted citizens' input is actually impacting the success of an initiative. Clarity over citizens' input is associated both with citizens' perception on the trustworthy nature of a process, and with institutional clarity over the collective knowledge which was gathered through a participatory process. Institutions often complain that they don't have capacity to interpret and use scattered data provided by citizens along brainstorming exercises. Highlighting ideas extracted from such exercises is supposed to help both institutions and citizens in tracing the impact of participation. It is questionable if these "technologies of connection" (Coleman and Gotze, 2001) that facilitate communication, feedback or exchange of information also can conduct to building interpersonal relationships.

Finally, it was sought to bring clarity over the type of participation which triggers the best chances for success in collaborative legislation endeavors. Additionally, the relation between Engagement and Reporting over participation results was investigated.

## RESULTS AND DISCUSSION

Within CONSUL methodology sample, consisting in 61 entries, there were 15 cases of unprocessed documents, 3 cases when documents moved under processing and 43 cases of adopted documents. Only within 29 situations an official report was published to explicitly mention which citizens' ideas or commentaries were considered useful. Ideas contribution exercise was ran 48 times, while co-editing exercise was conducted in 16 instances. In three instances, both exercises were conducted. Within DECIDIM methodology sample, consisting in 19 entries, there were 0 unprocessed documents, 14 cases of documents being currently under processing, and 5 adopted documents. Only in 7 instances, a report, to explicitly mention which citizens' ideas were considered useful for the final document, was filled. Ideas contribution exercise was ran 17 times, while direct meetings were conducted 18 times.

The Mann-Whitney Test showed that the difference between CONSUL and DECIDIM method in terms of odds of success was significant, with  $p < .05$ ,  $z = -1.948$ , and  $U = 428.5$ . The effect of the method used was  $r = .217$ , which is a small to medium effect. That would mean that within CONSUL methodology group appears the greatest number of high scores on success. The two methodologies were also found to be significantly different in triggering engagement, with  $p < .05$  and  $U = 401.00$ . As  $z = -2.01$ , the effect of the used method over engagement is  $r = -.225$ , which, again, is a small to medium effect, with CONSUL methodology tending to significantly trigger more engagement than DECIDIUM. There was no significant difference between the two methods in terms of reporting over the participative exercise ( $p = .416$ ,  $z = .813$ ,  $U = 517.5$ ). General relations between variables were tested by running a Spearman test both for the overall data, and for each methodology, respectively. Significant relations between the success of a collaborative legislation initiative and the other variables are reported in Table 1, as follows.

Table 1: Significant Spearman Correlations between study variables

|                       | Methodology | Engagement | Reporting | Status<br>(success) | Ideas<br>Contribution | Co-<br>Editing | Direct<br>Meetings |
|-----------------------|-------------|------------|-----------|---------------------|-----------------------|----------------|--------------------|
| Methodology           | 1           |            |           |                     |                       |                |                    |
| Engagement            | -.227*      | 1          |           |                     |                       |                |                    |
| Reporting             | -           | -          | 1         |                     |                       |                |                    |
| Status<br>(Success)   | -.219       | -          | -         | 1                   |                       |                |                    |
| Ideas<br>Contribution | -           | .405**     | -         | -.328**             | 1                     |                |                    |
| Co-Editing            | -.279*      | -          | -         | .345**              | -.801**               | 1              |                    |
| Direct<br>Meetings    | .965**      | -.245*     | -         | -                   | -                     | -.269          | 1                  |

Ns = not significant ( $p > .05$ ), \* $p < .05$ , \*\* $p < .01$

The relations between used methodology and the type of exercise is obvious, since only CONSUL methodology is using co-editing, and only DECIDIM methodology specifically reports on direct meetings for drafting documents, while both methodologies include ideas contribution exercises.

CONSUL methodology is associated with higher engagement scores and a possible bigger rate of success – although the relation is insignificant, its value is close to significance threshold, with  $r=-.219$ , and  $p=.051$ . Obviously, ideas contribution exercise is connected with higher levels of engagement, while direct meeting exercise is associated with a lower engagement. What influences the final adoption may be related not only to citizen demand, but also to an administrative or political will (Seongkyung *et al.*, 2020). Taking into consideration that the concept of engagement has been explored in different ways (Rosado-Pinto and Loureiro, 2020) this may happen when collaborative legislation initiatives have not benefited from much public recognition. Also, there is a negative significant relation between ideas contribution and co-editing, indicating that most of the times when this type of exercise is conducted, the co-editing exercise is not run. More clarity over the overall relations is brought by investigating them within samples grouped by methodology. The significant relations are reported for CONSUL methodology in Table 2, while those for DECIDIM methodology are reported in Table 3, as follows.

Table 2: Significant Spearman Correlations within CONSUL methodology group

| Table 1.  | Engagement | Reporting | Status (success) | Ideas Contribution | Table 2. Co-Editing |            |
|-----------|------------|-----------|------------------|--------------------|---------------------|------------|
| Table 3.  | 1          |           |                  |                    | Table 4.            |            |
| Table 5.  | -          | 1         |                  |                    | Table 6.            |            |
| Table 7.  | -          | -         | 1                |                    | Table 8.            |            |
| Table 9.  | .427**     | -         | -.334**          | 1                  | Table 10.           |            |
| Table 11. | Co-Editing | -.285*    | -                | .321*              | -.873**             | Table 12.1 |

Ns = not significant ( $p > .05$ ), \* $p < .05$ , \*\*  $p < .01$

The Spearman test confirms the obvious observation that the level of engagement gets higher when ideas are asked and lower during co-editing exercise. The negative relation between ideas contribution and co-editing signifies that most of the times when one exercise is run, the other is not.

However, interestingly, there seems to be a negative relation between the score of success and ideas contribution exercise, and a positive relation between the success and co-editing exercise. That would suggest that when people are asked to contribute with ideas, the scores for success (moving a project under processing or having it adopted) go down. The opposite relation is found for conducting a co-editing exercise, when scores for success go up. No significant relation was found, between

Engagement and success. Also, no significant relation was found between reporting and any other variable, when CONSUL methodology is used.

Table 3: Significant Spearman Correlations within DECIDIM methodology group

|                       | Engagement | Reporting | Status<br>(success) | Ideas<br>Contribution | Direct<br>Meetings |
|-----------------------|------------|-----------|---------------------|-----------------------|--------------------|
| Engagement            | 1          |           |                     |                       |                    |
| Reporting             | -          | 1         |                     |                       |                    |
| Status<br>(Success)   | -.535*     | -         | 1                   |                       |                    |
| Ideas<br>Contribution | .533*      | -         | -                   | 1                     |                    |
| Direct<br>Meetings    | -          | -         | -                   | -                     | 1                  |

Ns = not significant ( $p > .05$ ), \* $p < .05$ , \*\*  $p < .01$

For DECIDIM methodology, the only significant relations were found for Engagement and Ideas Contribution, which is obviously, positive, and for Engagement and Status or success, which is negative. The last relation indicates that as the scores for engagement get higher, the ones for success get lower. Similarly, as in the case of CONSUL methodology, no relations between reporting and the other variables were found.

To further investigate if the method, the level of engagement, the reporting practice, the amount of reported citizen feedback or the type of participation have any effect on the success of the initiative, multinomial logistic regressions were run. Only the method used and the amount of highlighted citizens' ideas, considered to be useful for drafting the body of a regulation, were found to be significant predictors for odds of having a project rather under processing or adopted, than unprocessed.

With these two predictors, the model was found significantly (with  $p=.000$ ) better than no model, which would have meant to simply take into consideration the means values. The decrease in unexplained variance, as showed by Chi-square tests, from the baseline model (146.948) to the final model (88.191) was also significant. The model was found to be a good fit for data, as predicted values were not significantly different from the observed values, as indicated by deviance statistics ( $p=.99$ ), and Pearson test ( $p=.99$ ). The Cox and Snell value was .520, indicating a medium to large effect. The likelihood of a project to be rather under processing than unprocessed increased when a co-editing exercise was run ( $b=-18.76$ , Wald  $\chi^2(1)=170.69$ ,  $p=.00$ ) and when CONSUL methodology was used ( $b=-22.33$ , Wald  $\chi^2(1)=277.9$ ,  $p=.00$ ). However, the results are obviously skewed by the difference between the size of the samples.

A better understanding could thus be gained by looking at the data as grouped by used methodology. When running logistic multinomial regressions within each group, a slightly different pattern of relations is highlighted. For CONSUL methodology, the odds of having a project rather under

processing, than unprocessed were computed at first and the co-editing exercise remained a significant predictor ( $b=-19.73$ , Wald  $\chi^2(1)=164.44$ ,  $p=.00$ ), indicating that there are better chances of having a project under processing, than unprocessed when a co-editing exercise was run. When computing the odds of having a project rather adopted than under processing, the effect of co-editing became insignificant ( $b=.81.73$ , Wald  $\chi^2(1)=.27$ ,  $p=.59$ ). The decrease in the amount of highlighted citizens' ideas was, instead, found to predict increased likelihood for this situation ( $b=-.11$ , Wald  $\chi^2(1)=5.79$ ,  $p=.01$ ).

A narrow look into of data shows that within the sample of projects which passed through community editing exercise, there is a cohort of cases for which no report was compiled to highlight citizens' ideas considered to be significant for the drafted regulation, and within this group we have the greatest chances to find a project rather adopted, than under processing. Also, in most of the cases, the ideas contribution and the co-editing exercises were not both run. For co-editing exercises there are no reports with highlighted citizens' input. Also, the process is generally triggering less engagement within the general population, than the exercise calling for ideas contribution. When a project is passed through co-editing process, the local government is generally asking a group of experts to work with public servants on a regulation, then the documented is uploaded and general population is allowed to directly comment on it. However, most of the times, the commentators are the authors themselves and no revision history is available to follow on what public comments were incorporated into a new version of the document. Bigger chances to find a project rather under processing, than unprocessed, within the sample of projects which ran through co-editing process may suggest that there are better success odds for projects which triggered less engagement and were not passed through a reviewing system aimed to highlight citizens' input. As the case may be, the lack of specific reporting may be explained by the fact that the text itself is a product of citizens' work. In the case of DECIDIM methodology, no project was unprocessed, so the odds were computed for the likelihood of having a project rather adopted than under processing. The engagement was found as the only predictor improving the basic model, but it was insignificant ( $b=-.09$ , Wald  $\chi^2(1)=2.06$ ,  $p=.15$ ). For instance public authorities may take into consideration only solutions or recommendations from collaborative legislation initiatives that are sustainable and already gained prominence withing the local communities (Desouza and Bhagwatwar, 2014).

## IMPLICATIONS

The limited results should be interpreted with caution, as they may be assigned to the relative small sample of entries, the uneven size of the cohorts associated with the two methodologies, and the incidental distribution of success scores within DECIDIM cohort, where no case of unprocessed

document was found. However, the present research is more revealing in terms of relations which were not found, than through what it highlights.

A somewhat disconcerting observation is that engagement and high engaging participatory processes weren't found to increase the success odds for a collaborative regulation, and neither did specific reporting on citizens' input. Actually, as CONSUL and DECIDIM methodologies are defined, there are better success odds for those projects which although are collaboratively drafted, the process mirrors the standard institutional procedure. The exercise of co-editing does not differ essentially from drafting a project during several direct meetings between specialists. Although the general content is submitted for comments to the general population, most of the times, comments come from the authors themselves. So, both methodologies imply engaging external experts who work much in the same way. There is not obvious difference between the manner of working within groups of external specialists and working within groups of internal, governmental specialists. The most successful process in collaborative legislation thus mirrors the institutional design for getting a regulation done.

Even more disconcerting, the lack of significant relations within the sample is indicative for other factors which may have a greater influence on the success outcome. Having the best chances to find an approved document, rather than one which is still under processing, within the cohort of cases which triggered low engagement and were not processed to specifically report on highlighted citizens' input, could suggest that internal, political will could be playing a greater impact on whether a regulation is passed or not, even in those cases when collaborative processes are enabled. Other possible factors which could influence the odds of success are, of course, the intrinsic complexity and the social impact of the drafted regulation. As complexity and social impact raise, it should be expected for longer periods of time to pass until approving. Future investigations should focus on measuring and controlling for complexity and estimated social impact of the regulations subjected to participation processes.

## CONCLUSIONS

As sequential conclusions, it should be remarked that for the time being, collaborative legislation processes may rather serve more as a tool to build public trust in institutions, than an operative alternative way of taking public decisions.

## RELATIONSHIP BETWEEN EWOM IN SOCIAL MEDIA AND CUSTOMERS' PURCHASE INTENTIONS IN EGYPT AND LITHUANIA

Pauliene, Rasa; Vaiginiene, Erika; Abbas, Khaled

Faculty of Economics and Business Administration Vilnius University, VU, Vilnius, Lithuania

### ABSTRACT

**Purpose** - The present study is an initial attempt to assess and compare relationship of eWOM information in social media and purchase intentions of customers in two culturally different countries: Egypt as a country of collectivistic culture and Lithuania as a country of individualistic culture.

**Design/Methodology/Approach** - A quantitative method was used for the purpose of this study, and a sum of 500 fulfilled questionnaires were obtained; software IBM SPSS was applied for the data statistical analysis and 12 hypotheses' testing.

**Findings** - Despite the fact that Egypt is a country of collectivistic culture and Lithuania is a country of individualistic culture the research hypotheses' testing results reveal that the higher is eWOM information quality, credibility, usefulness, and adoption in social media the higher are purchase intentions of customers in both countries. Nevertheless, in Egyptian respondents' group the positive relationship between eWOM information credibility and purchase intention is the strongest (more than information quality, usefulness, adoption), however, in Lithuanian respondent's group positive relationship between eWOM information quality and purchase intention is the strongest (more than information adoption, usefulness, credibility).

**Originality/value** - Even though the influence of eWOM information is widely researched and discussed in the scientific literature, there is still a lack of researches identifying differences of online customer behavior in culturally different countries. The aim of the present research was to analyze the link between eWOM information credibility, quality, usefulness, and adoption as well as their relationship with customer behavior and purchase intentions in two culturally different countries - Egypt and Lithuania.

*Keywords: eWOM, information credibility, quality, usefulness, adoption, purchase intention, Egypt, Lithuania*

### INTRODUCTION

Many previous studies consider the traditional word of mouth (WOM) to be one of a powerful tool in terms of face to face communication; however, during the last decade the use of e-commerce as well as the spread of online communication has increased significantly. As a result, companies have begun to pay attention to customer recommendations on their products, especially e-recommendations, because Internet users can express their views through web pages, social networks, online communities, blogs, or chat rooms (Helvesen *et al.*, 2018; Erkan and Evans, 2016, Kudeshia and Kumar, 2017; Orus *et al.*, 2019; Zhu *et al.*, 2018). EWOM (hereinafter - eWOM) has been increasing extensively because customers are willing to look for the opinions and experiences of peer shoppers before deciding to purchase a service or product. Many companies have started considering online customers' reviews as an essential tool to help them sell products, build customer's trust as well as manipulate online reviews in an attempt to impact customer's purchase intentions and decisions (Orus *et al.*, 2019; Yan *et al.* 2016). According to Hennig-Thurau *et al.* (2004) eWOM is any statement - positive or negative - delivered by current, former, or potential customers about a product, company, or service, which is accessible to many people through the Internet. Marketing and advertising professionals have long known influence of WOM on purchase decisions, customers' satisfaction, and repurchase intentions. According to Helversen *et al.* (2017), Orus *et al.* (2019), Zhu *et al.* (2018) information about products on online shops have much stronger relations with customers and stimulate their empathy more than information from any website designed by marketers. Litvin *et al.* (2008) define eWOM as any kind of informal communication of customers through Internet-based technology related to the past or present usage of particular products or services and their characteristics or the products' sellers. Helversen *et al.* (2017), argue that eWOM communications influence the overall grasp value of the company as they revealed that the overall know-how information exchanged online has a direct relationship and impact on customers' loyalty and intentions. According to Zhu *et al.* (2018) online recommendations impact customers' decision to purchase online products; however, not all sources of recommendations have the same effect on customers (Orus *et al.*, 2019; Zhu *et al.*, 2018). Researchers also argue that negative eWOM has a bigger impact than positive eWOM as people tend to give more weight to negative recommendations than positive ones, also suggest that negative information captures more people's attention than positive information. Park and Lee (2007) state that negative eWOM increases a state of suspicion and fear. Hennig-Thurau *et al.* (2004) also refer that eWOM significantly impact future customers.

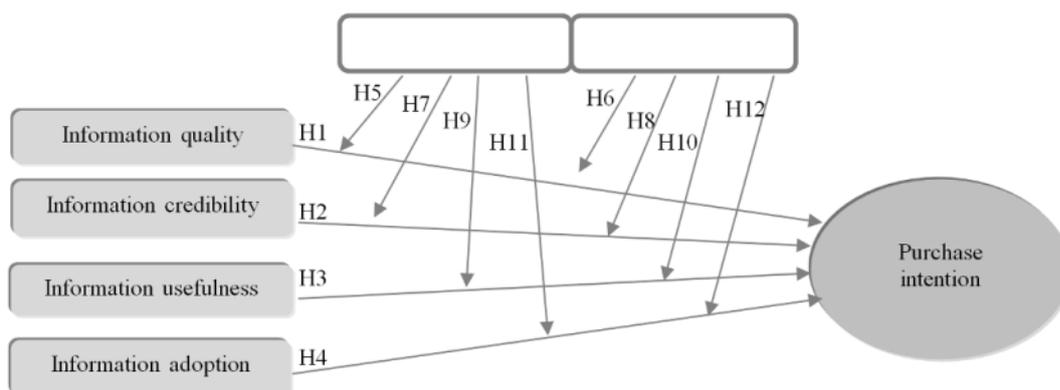

Despite the fact that influence of eWOM information in social media is widely researched and discussed in scientific literature, there is still a lack of researches identifying differences of online customer behavior in culturally different countries. Aim of the study - to assess and compare relationship of eWOM information in social media and purchase intentions of customers in two

countries - Egypt as a country of collectivistic culture and Lithuania as a country of individualistic culture. Objectives: 1) To overview scientific literature considering eWOM information credibility, quality, usefulness, and adoption and their relationship with customer behavior and purchase intentions; 2) To research the eWOM information relationship with customers' purchase intentions in Egypt and Lithuania. Based on Erkan and Evans (2016) theoretical research model the current study aims to investigate of how eWOM information credibility, quality, usefulness, and adoption influence customers' purchase intention. The quantitative research method has been applied with the empirical research instrument - a survey questionnaire. Depending on the number of respondents - similar researches samples and using a random sampling method, 500 anonymously filled in questionnaires have been collected in two culturally different countries - Egypt and Lithuania. Software IBM SPSS was applied for the data statistical analysis and 12 hypotheses' testing. The findings can help e-retailers to better identify similarities and differences, also exploit benefits of customer recommendations in culturally different countries.

## **THEORETICAL BACKGROUND**

The Internet provides a lot of information to its users; however, the information not always can be trusted. Scholars define trust as behavioral intentions that result from a general belief in an online retailer, a combination of trustworthiness, integrity, ability, and benevolence of online retailers. Although trust in online reviews has often been an important focus in the concept of eWOM, Chang *et al.* (2015) state that online reviews that appear on a shopping site of a particular brand are less trusted because of obvious intention of the seller to present his products as the best on the market. In contrast, reviews written on independent review sites or published on personal blogs are considered as more trusted than the information on the brands' websites. According to Negash *et al.* (2003) not only trust but also information quality should be considered. Over years many different characteristics have been viewed by researchers as important determinants of information quality, such as accuracy, precision, currency, output timeliness, reliability, completeness, conciseness, format, relevance, understandability, report usefulness, sufficiency, freedom from bias, comparability, and etc. (Helvesen *et al.*, 2018; Orus *et al.*, 2019; Zhu *et al.*, 2018). Park *et al.* (2007) also revealed that the very first reviews on the list have a bigger positive impact on consumer's purchasing intentions than the last reviews. Sussman and Siegal (2003) state that information quality influences a consumer's behavioral intentions, Negash *et al.* (2003) argue that both quantity and quality of the information are considered as important for the customers and help the customer in the online shopping process. Some researchers also consider adoption and the usefulness of the information as the main predictors about consumers and their purchasing intentions (Orus *et al.*, 2019; Park *et al.*, 2007; Sussman and

Siegal, 2003). Researchers believe that people tend to adopt the information when they find it useful; therefore Sussman and Siegal (2003) state that usefulness is one of the most critical elements of information acceptance. Cheung *et al.* (2008) argue that if customers believe in the information and find the information as credible, at this moment, they will adopt eWOM to help them in making their decisions. In contrast, if the customer doubts the reliability of the information, he or she will be inclined not to adopt it thus the adaptation of eWOM will decrease. Negash *et al.* (2003) defined information adoption as a degree to which people will accept the information that they are presented as useful, after assessing its validity. Cheung *et al.* (2008) also state that information adoption is an action in which customers start to interact in using this information; therefore such adoption behavior is one of the most crucial activities that impact the further decisions of the customer. Although intentions are identified as a salient indicator of real attitude to shop online, it should be considered that purchase intention will not necessarily transform into purchase action (Orus *et al.*, 2019; Zhu *et al.*, 2018). The authors suggest that purchase intention has a positive impact on real online purchasing and propose to further research relationships between the two variables in future studies. Chang *et al.* (2015) state that online recommendations have become a center of attention for marketers as they impact behavior of customers stronger than traditional advertisements. Because of skepticism towards traditional ads customers prefer information and recommendations of their friends at social media or even strangers on the Internet. Chang *et al.* (2015) conclude that the popularity of posts of friends or online customers plays a considerable role in persuading customers thus impact their behavior, i.e. purchase intentions and purchase decisions.

**Figure 1.** The theoretical research model

## THE RESEARCH MODEL AND HYPOTHESES

The study aims to analyze and compare relationship of eWOM information in social media and purchase intentions of customers in Egypt and Lithuania as well as to understand more about differences in purchase intentions in the two countries. Lithuania stands for individualistic culture

and has a European mindset in comparison with Egypt, which is a country of collectivistic nature and Arabian mindset. In this study we analyze relationship between eWOM information and customers' purchase intentions; therefore in order to establish and formulate the research hypothesis as well as prepare the research methodology a theoretical model has been designed.

The model presumes that there is one dependent variable – a purchase intention and four independent variables, such as information quality, information credibility, information usefulness, and information adoption (Erkan and Evans, 2016). Based on the independent and dependent variables, 12 hypotheses have been formulated. Information quality is one of the crucial factors which impact consumers purchase intentions. According to Chang *et al.* (2015), Park *et al.* (2007), the higher is quality of the information on website the greater is satisfaction of the customers; therefore it is consequently increasing customers' purchasing intention on such sites. Moreover, Park *et al.* (2007) state that even though a stranger has provided the information on online websites, it affects customers' purchase intention.

H0 (p=0) There is no relationship between the quality of eWOM information in social media and purchase intention.  
 H1. ( $\rho \neq 0$ )The quality of eWOM information in social media has a positive relationship with purchase intention.  
 H0 (p=0) There is no relationship between the quality of eWOM information and purchase intention in Lithuania.  
 H1.a ( $\rho \neq 0$ )The quality of eWOM information has a positive relationship with purchase intention in Lithuania.  
 H0 (p=0) There is no relationship between the quality of eWOM information and purchase intention in Egypt.  
 H1.b The quality of eWOM information has a positive relationship with purchase intention in Egypt.

Flanagin *et al.* (2014), Cheung *et al.* (2012) revealed a significant positive relationship between recommendation credibility and purchase intention in different customer segments. Also Wu and Wang (2011), Park *et al.* (2007) revealed that online recommendation from higher credibility source makes a positive impact on consumer's purchase intention.

H0 (p=0) There is no relationship between the credibility of eWOM information in social media and purchase intention.  
 H2. ( $\rho \neq 0$ ) The credibility of eWOM information in social media has a positive relationship with purchase intention.  
 H0 (p=0) There is no relationship between the credibility of eWOM information in social media and purchase intention in Lithuania.  
 H2.a ( $\rho \neq 0$ )The credibility of eWOM information in social media has a positive relationship with purchase intention in Lithuania.  
 H0 (p=0) There is no relationship between the credibility of eWOM information in social media and purchase intention in Egypt.  
 H2.b ( $\rho \neq 0$ )The credibility of eWOM information in social media has a positive impact on purchase intention in Egypt.

According to Erkan and Evans (2016), Cheung *et al.* (2008), perceived usefulness differs in people's perceptions, however, they believe that it impacts customers' purchase intentions.

H0 (p=0) There is no relationship between the usefulness of eWOM information in social media and purchase intention.  
 H3. ( $\rho \neq 0$ )The usefulness of eWOM information in social media has a positive relationship with purchase intention.  
 H0 (p=0) There is no relationship between the usefulness of eWOM information in social media and purchase

intention in Lithuania.  
 H3.a ( $q \neq 0$ ) The usefulness of eWOM information in social media has a positive relationship with purchase intention in Lithuania.  
 H0 ( $p=0$ ) There is no relationship between the usefulness of eWOM information in social media and purchase intention in Egypt.  
 H3.b ( $q \neq 0$ ) The usefulness of eWOM information in social has a positive relationship with purchase intention in Egypt.

According to Cheung *et al.* (2008), before making a purchase decision users start scanning comments and reviews on the Internet and adopt information aiming to make the right choice of products. Although the information adoption may differ from platform to platform, the purchase intentions increase among customers who adopt eWOM information (Cheung *et al.* 2008; Erkan and Evans, 2016).

H0 ( $p=0$ ) There is no relationship between the adoption of eWOM information in social media and purchase intention.  
 H4. ( $q \neq 0$ ) Adoption of eWOM information in social media has a positive relationship with purchase intention.  
 H0 ( $p=0$ ) There is no relationship between the adoption of eWOM information in social media and purchase intention in Lithuania.  
 H4.a ( $q \neq 0$ ) Adoption of eWOM information in social media has a positive relationship with purchase intention in Lithuania.  
 H0 ( $p=0$ ) There is no relationship between the adoption of eWOM information in social media and purchase intention in Egypt.  
 H4.b ( $q \neq 0$ ) Adoption of eWOM information in social media has a positive relationship with purchase intention in Egypt.

Erkan and Evans (2016) find online reviews quality as a persuasive strength affecting purchase intentions. Helversen *et al.* (2017), Zhu *et al.* (2018) agree that high-quality reviews impact on purchase intentions is stronger than low-quality reviews.

H0 ( $p=0$ ) Quality of eWOM information in social media hasn't had an impact on customers' purchase intentions in Lithuania.  
 H.5 ( $q \neq 0$ ) Quality of eWOM information in social media has a stronger impact on customers' purchase intentions in Lithuania than in Egypt.  
 H0 ( $p=0$ ) Quality of eWOM information in social media hasn't had an impact on customers' purchase intentions in Egypt.  
 H.6 ( $q \neq 0$ ) Quality of eWOM information in social media has a stronger impact on customers' purchase intentions in Egypt than in Lithuania.

According to Yan *et al.* (2016) one of the most important factors that influence the consumer in the process of convincing is information credibility. Prendergast *et al.* (2010) suggest that the more information is credible the more it makes willingness to adopt eWOM in purchase intentions and purchase decisions.

H0 ( $p=0$ ) The credibility of eWOM information in social media hasn't had an impact on consumers' purchase intentions in Lithuania.  
 H.7 ( $q \neq 0$ ) The credibility of eWOM information in social media has a stronger impact on consumers' purchase intentions in Lithuania than in Egypt.  
 H0 ( $p=0$ ) The credibility of eWOM information in social media hasn't had an impact on consumers' purchase intentions in Egypt.  
 H.8 ( $q \neq 0$ ) The credibility of eWOM information in social media has a stronger impact on consumers' purchase intentions in Egypt than in Lithuania.

According to Flanagan *et al.* (2014), customers tend to adopt eWOM if they found information as useful and helpful in the purchase decision process.

H0 ( $p=0$ ) Usefulness of eWOM information in social media hasn't had an impact on consumers' purchase

intentions in Lithuania  
 H.9 ( $q \neq 0$ ) Usefulness of eWOM information in social media has a stronger impact on consumers' purchase intentions in Lithuania than in Egypt.  
 H0 ( $p=0$ ) Usefulness of eWOM information in social media hasn't had an impact on consumers' purchase intentions in Egypt.  
 H.10 ( $q \neq 0$ ) Usefulness of eWOM information in social media has a stronger impact on consumers' purchase intentions in Egypt than in Lithuania.

Cheung *et al.* (2012) revealed that information usefulness has a significant impact on eWOM adoption.

Yan *et al.* (2016) also state that information usefulness and credibility contribute significantly to consumer's eWOM adoption.

H0 ( $p=0$ ) Adoption of eWOM information in social media hasn't had an impact on consumers' purchase intentions in Lithuania.  
 H.11 ( $q \neq 0$ ) Adoption of eWOM information in social media has a stronger impact on consumers' purchase intentions in Lithuania than in Egypt.  
 H0 ( $p=0$ ) Adoption of eWOM information in social media hasn't had an impact on consumers' purchase intentions in Egypt.  
 H.12 ( $q \neq 0$ ) Adoption of eWOM information in social media has a stronger impact on consumers' purchase intentions in Egypt than in Lithuania.

To test the hypotheses a survey questionnaire has been conducted. The non-probability sampling method (convenience technique) has been chosen for the survey data gathering. In order to calculate respondents' sample of the research previous studies with similar research aims have been compared (Table 1).

Table 1. Average sample size based on previous researchers

The questionnaire was distributed through social media (Facebook) and email and targeted respondents in two countries: Egypt and Lithuania. In total 507 complete questionnaires were received; however, 7 questionnaires were excluded from the analysis as the respondents skipped number of statements of the questionnaire. In total, 500 questionnaires were valid for the research - 250 respondents from Egypt and 250 respondents from Lithuania. It corresponds with the comparative analysis of the sample size of previous researches, which showed that the average sample size must be around 250 respondents. All scales were previously validated and adopted from previous researches (Table 2). The survey questionnaire contains two sections, i.e. the first part indicates and measures independent variables: information quality, credibility, usefulness, and adoption; the second part indicates and measures dependent variable - online purchase intention. Statistical analysis was conducted in the IBM SPSS program software.

| Scale   | Items   | Cronbach's $\alpha$ |
|---|---|---------------------|
| Information quality<br>/Park et al., 2007           | I think they have sufficient reasons supporting their opinions.<br>I think they are objective.<br>I think they are understandable.<br>I think they are clear.<br>In general, I think the quality of them is high.           | 0.846               |
| Information credibility<br>/Prendergast et al. 2010 | I think they are convincing.<br>I think they are strong.<br>I think they are credible.<br>I think they are accurate.  | 0.862               |
| Information usefulness<br>/Cheung et al., 2008      | I think they are generally useful.<br>I think they are generally informative.   | 0.846               |
| Information adoption<br>/Cheung et al. 2009         | They contribute to my knowledge of the product.<br>They make it easier for me to make a purchase decision.<br>They enhance my effectiveness in making a purchase decision.<br>They motivate me to make a purchase decision. | 0.899               |
| Purchase intention<br>/Hille et al., 2015           | I would use the Internet to purchase a product.<br>Using the Internet to purchase a product is something I would do.<br>I could see myself using the Internet to buy a product.   | 0.909               |

Table 2. *Reliability of scales and items of the questionnaire*

All constructs had Cronbach's Alpha ( $\alpha$ ) above the conventional level of 0.7 (Nunnally, 1987); therefore, have been accepted as suitable and reliable for further research (Table 2). The scales have been measured by a 7-point Likert scale ranging from "totally disagree" to "totally agree". To facilitate and obtain the most accurate results of the respondents' answers, the questionnaire was translated and back-translated into and from Lithuanian and Arabic.

## RESEARCH RESULTS

To understand the effect and relationship of each variable to the intention to purchase in terms of positive or negative aspects, we applied a correlation analysis between independent variables (i.e. information quality, credibility, usefulness, adoption) and the dependent variable - purchase intention - separately. Pearson's correlation analysis (Table 3) showed that there is a moderate positive correlation between the quality of eWOM and purchase intention in both countries Egypt and Lithuania ( $r = .598^{**}$ ,  $P < 0.001$ ). These results indicate a positive relationship of information quality with purchase intention therefore hypothesis H1 is confirmed.

|                     |                       |        |        |
|---------------------|-----------------------|--------|--------|
| Information quality | Pearson's Correlation | 1      | .598** |
|                     | Sig. (2-tailed)       |        | .000   |
|                     | N                     | 500    | 500    |
| Purchase intention  | Pearson's Correlation | .598** | 1      |
|                     | Sig. (2-tailed)       | .000   |        |
|                     | N                     | 500    | 500    |

Table 3. Correlation between information quality and purchase intention in both countries

In the Lithuanian respondents' group Pearson's analysis shows a positive correlation between information quality and purchase intention in Lithuania ( $r = .472$ ,  $P < 0.001$ ), which indicates that information quality has a positive relationship with purchase intention therefore hypothesis H1.a is confirmed. In the Egyptian respondents' group Pearson's analysis shows a moderate positive correlation between information quality and purchase intention in Egypt ( $r = 0.600^{**}$ ,  $P < 0.001$ ), which indicates that information quality has a positive relationship with purchase intention therefore hypothesis H1.b is confirmed.

Pearson's correlation analysis (Table 4) showed that there is a moderate positive correlation between the information credibility of eWOM and purchase intention in both countries Egypt and Lithuania ( $r = .575^{**}$ ,  $P < 0.001$ ). These results indicate a positive relationship of information credibility with purchase intention therefore hypothesis H2 is confirmed.

|                         |                       |        |        |
|-------------------------|-----------------------|--------|--------|
| Information credibility | Pearson's Correlation | 1      | .575** |
|                         | Sig. (2-tailed)       |        | .000   |
|                         | N                     | 500    | 500    |
| Purchase intention      | Pearson's Correlation | .575** | 1      |
|                         | Sig. (2-tailed)       | .000   |        |
|                         | N                     | 500    | 500    |

Table 4. Correlation between information credibility and purchase intention in both countries

In the Lithuanian respondents' group Pearson's analysis shows positive correlation between information credibility and purchase intention in Lithuania ( $r = .318^{**}$ ,  $P < 0.001$ ), which indicates that information credibility has a positive relationship with purchase intention therefore hypothesis H2.a is confirmed. In the Egyptian respondents' group Pearson's analysis shows a moderate positive correlation between information credibility and purchase intention in Egypt ( $r = .626^{**}$ ,  $P < 0.001$ ),

which indicates that information credibility has a positive relationship with purchase intention therefore hypothesis H2.b is confirmed.

Pearson's correlation analysis (Table 5) showed that there is a moderate positive correlation between the information usefulness of eWOM and purchasing intention in both countries Egypt and Lithuania ( $r = .488^{**}$ ,  $P < 0.001$ ). These results indicate a positive relationship of information usefulness with purchasing intention therefore hypothesis H3 is confirmed.

|                        |                       |        |        |
|------------------------|-----------------------|--------|--------|
| Information usefulness | Pearson's Correlation | 1      | .488** |
|                        | Sig. (2-tailed)       |        | .000   |
|                        | N                     | 500    | 500    |
| Purchase intention     | Pearson's Correlation | .488** | 1      |
|                        | Sig. (2-tailed)       | .000   |        |
|                        | N                     | 500    | 500    |

Table 5. *Correlation between information usefulness and purchase intention in both countries*

In the Lithuanian respondents' group Pearson's analysis shows a positive correlation between information usefulness and purchase intention in Lithuania ( $P < 0.001$ ,  $r = .344^{**}$ ), which indicates that information usefulness has a positive relationship with purchase intention therefore hypothesis H3.a is confirmed. In the Egyptian respondents' group Pearson's analysis shows a moderate positive correlation between information usefulness and purchase intention in Egypt ( $p < 0.001$ ,  $r = .508^{**}$ ), which indicates that information usefulness has a positive relationship with purchase intention therefore hypothesis H3.b is confirmed.

Pearson's correlation analysis (Table 6) showed that there is a moderate positive correlation between the information adoption of eWOM and purchasing intention in both countries Egypt and Lithuania ( $P < 0.001$ ,  $r = .468^{**}$ ). These results indicate a positive relationship of information adoption with purchase intention therefore hypothesis H4 is confirmed.

|                      |                       |        |        |
|----------------------|-----------------------|--------|--------|
| Information adoption | Pearson's Correlation | 1      | .468** |
|                      | Sig. (2-tailed)       |        | .000   |
|                      | N                     | 500    | 500    |
| Purchase intention   | Pearson's Correlation | .468** | 1      |
|                      | Sig. (2-tailed)       | .000   |        |
|                      | N                     | 500    | 500    |

Table 6. *Correlation between information adoption and purchase intention in both countries*

In the Lithuanian respondents' group Pearson's analysis shows a positive correlation between information adoption and purchase intention in Lithuania ( $r = .352^{**}$ ,  $P < 0.001$ ), which indicates that information adoption has a positive relationship with purchase intention therefore hypothesis H4.a is confirmed. In the Egyptian respondents' group Pearson's analysis shows a moderate positive correlation between information adoption and purchase intention in Egypt ( $P < 0.001$ ,  $r = .451^{**}$ ), which indicates that information adoption has a positive relationship with purchase intention therefore hypothesis H4.b is confirmed.

To test the remaining hypotheses each variable and its effect on the intention to purchase separately in Egypt and Lithuania were compared with each other. This part of the analysis aims to reveal differences between individualistic culture (Lithuania) and collectivistic culture (Egypt) in terms of each independent variable impact on purchase intention.

| Independent variable | Dependent variable | Country   | F       | R2   | T      | P-value | Standardized Beta |
|----------------------|--------------------|-----------|---------|------|--------|---------|-------------------|
|                      |                    | Egypt     | 139.609 | .360 | 11.816 | P<0.001 | .600              |
| Inf. quality         | Purchase intention | Lithuania | 71.186  | .223 | 8.437  | P<0.001 | .472              |

Table 7. Comparison of information quality impact on purchasing intention in Egypt and Lithuania

Simple linear regression analysis was used to measure differences of information quality impact between the two countries (Table 7). A significant regression equation was found in Egyptian respondents' group ( $F = (139.609)$ ,  $P < 0.001$ ) with an  $R^2 = .360$ , and coefficient beta  $b = .600$ . In contrast, the regression equation in the Lithuanian respondents' group was found ( $F = 71.186$ ,  $P < .001$ ) with an  $R^2 = .223$ , and coefficient beta  $b = .472$ . The P-value in both countries is  $P < .001$ ; however, the impact in the two countries is different: 36% of purchase intention is explained by information quality in Egypt compared to 22.3% in Lithuania; the information quality of eWOM in Egypt ( $b = .600$ ) was found as more influential on customers' purchase intention than in Lithuania ( $b = .472$ ). It supports the argument that the quality of eWOM has a stronger impact in Egypt than in Lithuania. As a result, the hypothesis H5 is rejected. On the other hand, the hypothesis H.6 is confirmed.

| Independent variable | Dependent variable | Country   | F       | R2   | T      | P-value | Standardized Beta |
|----------------------|--------------------|-----------|---------|------|--------|---------|-------------------|
|                      |                    | Egypt     | 160.481 | .392 | 12.656 | P<0.001 | .629              |
| Inf. credibility     | Purchase intention | Lithuania | 27.853  | .101 | 5.278  | P<0.001 | .318              |

Table 8. Comparison of information credibility effect on purchasing intention in Egypt and Lithuania

Simple linear regression analysis was used to measure information credibility impact differences between the respondents' groups of two countries (Table 8). The results were found as significant in both countries  $P < .001$ ; however, in Egypt, almost 40% of purchase intentions are explained by information credibility (in contrast, 10.1% in Lithuania). Also the information credibility of eWOM has a bigger impact on purchase intention Egypt ( $b = .629$ ) than in Lithuania ( $b = .318$ ) therefore hypothesis H.7 is rejected. On the other hand, hypothesis H.8 is confirmed.

| Independent variable | Dependent variable | Country   | F      | R2   | T     | P-value | Standardized Beta |
|----------------------|--------------------|-----------|--------|------|-------|---------|-------------------|
|                      |                    | Egypt     | 86.315 | .258 | 9.291 | P<0.001 | .508              |
| Inf. usefulness      | Purchase intention | Lithuania | 33.349 | .119 | 5.775 | P<0.001 | .344              |

Table 9. *Comparison of information usefulness effect on purchasing intention in Egypt and Lithuania*

Simple linear regression analysis was used to measure information usefulness impact differences in the respondents' groups of the two countries (Table 9). A significant regression equation was found in Egypt ( $F = (86.315)$ ,  $P < 0.001$ ) with an  $R^2 = .258$  and coefficient beta  $b = .508$ . In contrast, the regression equation in Lithuania was found ( $F = 33.349$ ,  $P < .001$ ) with an  $R^2 = .119$ , and coefficient beta  $b = .344$ . In both countries the results were significant ( $P < 0.05$ ). Nevertheless, there is a difference between both countries: in Egyptian respondents' group 11% of intention to purchase was impacted by information usefulness (in Lithuanian - almost 12%). Also the eWOM information usefulness is more influential on customers' purchase intention in Egypt ( $b = 508$ ) than in Lithuanian ( $b = .344$ ); therefore it lets to conclude that information usefulness impacts purchase intention more in Egypt than in Lithuania. As a result, the hypothesis H.9 is rejected. On the other hand, the hypothesis H.10 is confirmed.

| Independent variable | Dependent variable | Country   | F      | R2   | T     | P-value     | Standardized Beta |
|----------------------|--------------------|-----------|--------|------|-------|-------------|-------------------|
|                      |                    | Egypt     | 63.180 | .203 | 7.949 | $P < 0.001$ | .451              |
| Inf. adoption        | Purchase intention | Lithuania | 35.093 | .124 | 5.924 | $P < 0.001$ | .352              |

Table 10. *Comparison of information adoption effect on purchasing intention in Egypt and Lithuania*

Simple linear regression analysis was used to measure the impact of information usefulness in the two countries (Table 10). A significant regression equation was found in Egypt ( $F = (63.180)$ ,  $P < 0.001$ ) with an  $R^2 = .203$  and coefficient beta  $b = .451$ . In contrast, the regression equation in Lithuania was found ( $F = 35.093$ ,  $P < .001$ ) with an  $R^2 = .124$  and coefficient beta  $b = .352$ . In both countries the results were significant  $P < 0.05$ . The analysis revealed that 20.3 % of purchase intention is explained by the information adoption in the Egyptian respondents' group compared to 12.4% in the Lithuanian respondents' group. Moreover, the information adoption impacts Egyptian customers' purchase intention ( $b = .451$ ) more than Lithuanian ( $b = .352$ ). These results support an argument that eWOM information adoption in Egypt has more impact on consumers' purchase intentions than in Lithuania; therefore the hypothesis H.11 is rejected. On the other hand, the hypothesis H.12 is confirmed.

## MANAGERIAL IMPLICATIONS AND FURTHER RESEARCH

Many studies prove the importance of eWOM information and its relationship with purchase intentions therefore online information has become a center of attention for both researchers and marketers as customers' opinions, reviews and recommendations on social media greatly influence some groups of customers' behavior more than traditional ads. The 12 hypotheses of the study measure relationships between independent variables – eWOM information quality, credibility, usefulness, and adoption and the dependent variable - purchase intention in two culturally different

countries – Egypt and Lithuania. Although Lithuania stands for individualistic culture and has a European mindset in comparison with Egypt, which is a country of collectivistic nature and Arabian mindset, the research hypotheses' testing results reveal that the higher is information quality, credibility, usefulness, and adoption of eWOM in social media the higher are purchase intentions of customers in both countries. Nevertheless, in Egyptian respondents' group the positive relationship between eWOM information credibility and purchase intention is the strongest (more than information quality, usefulness, adoption), however, in Lithuanian respondent's group positive relationship between eWOM information quality and purchase intention is the strongest (more than information adoption, usefulness, credibility).

This study has some limitations because the two countries respondents' demographical characteristics were not included into the analysis therefore it is not possible to draw general conclusions about how eWOM information in social media influences customers' purchase intentions in different demographic groups of respondents (e.g., by age, income, education). Despite the research was carried out in Egypt and Lithuania only, the findings of the empirical study can be seen not only in the context of Egyptian and Lithuanian realities. These realities can be considered as an implication for further research as well as appreciated to the extent that they help to better understand general global trends and processes as well as to consider both similarities and differences that occur in the individualistic and collectivistic cultures. Expansion of the number of countries participating in the survey and extension of the analysis of the demographic groups of the respondents can be the object of further research. Such systematic research would allow e-retailers to better identify and exploit the benefits of customer recommendations in culturally different countries.

## ABSTRACT

This study aims to investigate the relationship between entrepreneurship and the perceived quality of life in European smart cities. The research uses objective and subjective variables, respectively, to analyze the relationships between entrepreneurial performance and the dimensions of the quality of life, interpreted in terms of smart city's dimensions. On the basis of the quality of life survey by Eurostat, we measure the perceived quality of life for a sample of 43 cities. We conduct a cluster analysis and adopt a non-aggregative quantitative approach based on the theory of the partially ordered set in order to find evidence that smart cities must develop drivers for the quality of life in order to attract and retain entrepreneurial activities. Specifically, we highlight that the perceived quality of life sustains entrepreneurship in the long-term. We suggest the governments of smart cities to focus on creating a conducive environment for entrepreneurship, encouraging and promoting interventions for improving citizens' quality of life. The findings add to the body of knowledge in the entrepreneurship literature and provide implications for how managers and policymakers can enhance the attractiveness of the entrepreneurial environment.

*Keywords: Entrepreneurship, smart city, quality of life*

## INTRODUCTION

There has been a revival of academic interest in the role that cities play in national economies and regions (Fritsch and Storey, 2014). Recent studies have started considering cities as an environment for entrepreneurship (Szerb et al., 2013; Audresch et al., 2015). A few academic contributions address the economic and social effects of entrepreneurship (Audretsch et al., 2015) and the drivers of entrepreneurial ecosystems in European cities (Audretsch and Belitski, 2017; Ivaldi et al., 2020 b; Penco et al., 2020). Moreover, the extant literature on urban entrepreneurship focuses on the characteristics of the urban ecosystem in terms of the regional system of entrepreneurship (Szerb et al., 2013; Acs et al., 2014), while only a few contributions view the quality of life at the city level as a

driver of entrepreneurial activities. The seminal work of Pennings (1982) used aggregated indexes, but it discussed the need to employ data sources that can provide direct accounts of individual-level perceptions of local quality of life (Osorio, 2018). The quality of life is accurately expressed by the level of life satisfaction (or subjective well-being) (Florida et al., 2013). In the same vein, limited literature has focused on the perceived quality of urban life and the entrepreneurial activity at the city level (Audretsch and Belitski, 2015). In order to fill the aforementioned research gaps, this research aims to identify the existence of a relationship between entrepreneurship and the perception of urban quality of life. Specifically, we address the following research questions (RQ): RQ1: *Is the perceived urban quality of life a stimulus for entrepreneurship at European Union (EU) level?* RQ2: *Which quality of life domains (interpreted in the light of a smart city's dimensions) are more conducive to stimulating urban entrepreneurship at EU level?* Following Audretsch and Belitski (2015), for the EU cities, the perception of the quality of life is investigated using subjective variables connected to the main smart city dimensions. To the best of our knowledge, this is the first study to establish a direct relationship between the measures of the subjective quality of life and the main smart city profiles (Dameri et al. 2019).

## LITERATURE REVIEW

### *Entrepreneurship at the city level*

Based on the regional system of entrepreneurship, most of the studies consider the country- or regional level (Acs et al., 2014). Recent entrepreneurship policy trends and related academic research (Audretsch and Belitski, 2017; Penco et al., 2020) focus not only on the national and regional perspectives to but also on the local-urban perspective. Economic geography and urban economics studies have found that entrepreneurial activity (especially Schumpeterian entrepreneurship) is more concentrated and clustered than manufacturing (Adler et al., 2019). In this context, it must be noted that the most important appeal of large metropolitan areas is linked to agglomeration economies (Szerb et al., 2013; Ferraris et al., 2020). Cities will thrive and grow if they provide amenities and infrastructure attractive to their high human-capital residents (Audretsch et al., 2015). In return, entrepreneurship serves as a conduit for the spillover of creativity to urban economic development (Florida, 2002). The urban context also offers other drivers for the clustering of entrepreneurial activity and innovation at the city level (Adler et al., 2019). The creation of a positive atmosphere in terms of the quality of life attracts and retains businesses, knowledge-workers, and entrepreneurs (Musterd and Gritsai, 2012). However, urban policy managers are faced with the challenge to create a positive climate for attracting and retaining entrepreneurs that stimulate the urban wealth (Porter, 1996). Despite the relevance of the aforementioned topics, limited literature explicitly reveals any

relationship between the development of the urban-level entrepreneurship and the quality of life (Pennings, 1982). There is also a lack of attention to entrepreneurship at the city and EU levels (Ács et al., 2014).

#### *Subjective well-being and quality of life within the smart city framework*

Public policies can stimulate urban development. The most important cities are oriented to implement smart city policies to foster urban development (Camboim et al., 2019; Dameri et al., 2019; Ferrari et al., 2018; Ivaldi & Ciacci, 2020). The most important dimensions of the concept are: Economy; Governance; People; Welfare; Culture; Environment; ICT & Mobility. Different researches have specified that the main dimensions of a smart city can contribute toward entrepreneurial attractiveness (Richter et al., 2015). The smart city dimensions aimed at creating a good urban environment are usually measured by objective indicators (Ivaldi et al., 2020 b). Consistent with the theorists of well-being, the urban quality of life can also to be estimated by subjective measures (Audrescht et al., 2015). Pennings (1982) suggested to use data sources that can provide direct accounts of individual-level perceptions of local quality of life (Osorio, 2018; Ciacci et al., 2020). Analyzing the capacity to attract “creative people,” Florida et al. (2013) stated that the “happiness of cities”.

## METHODOLOGY

### *Sample*

Consistent with Penco et al. (2020) and Bruzzi et al. (2019), a sample of 28 EU capital cities was constructed. The final sample comprised 43 cities involved in smart city policies (Table 1).

Table 1: Sample and groups

| Cities   | Group name          | Number of cities | Quartile  |
|--|---------------------|------------------|---|
| London, Paris, Madrid, Barcelona, Berlin, Rome, Athens, Warsaw, Manchester, Hamburg, and Budapest  | Large cities        | 11               | Population of the metropolitan area exceeding the third quartile of the distribution          |
| Lisbon, Munich, Vienna, Stuttgart, Amsterdam, Lille, Frankfurt, Prague, Brussels, Turin, Bucharest, Stockholm, Copenhagen, Dublin, Glasgow, Sofia, Helsinki, Bordeaux, Düsseldorf, Krakow, and Dresden | Medium-sized cities | 21               | Population of the metropolitan area between the first and third quartiles of the distribution |
| Malmo, Zagreb, Cardiff, Vilnius, Karlsruhe, Riga, Bratislava, Tallinn, Luxembourg, Ljubljana, and Valletta   | Small cities        | 11               | Population of the metropolitan area within the first quartile of the distribution             |

### *Selection of variables*

In order to analyze the relationship between the urban-level entrepreneurship and the perceived quality of life (measured in terms of satisfaction for each smart city dimension), we collect objective

and subjective data. Based on sub-indexes connected to the most important smart city dimensions, we develop an innovative multidimensional index (HUI—Happiness Urban Index) to better explain the different dimensions of the perceived quality of life. Table 2 below describes the structures of ENT and HUI.

Table 2: Description of variables (objective and subjective) and indexes.

| Dimension                           | Sub-dimension       | Variables   | Source  | Variable COD | Sub-indexes (COD) | Indexes (COD) |
|-------------------------------------|---------------------|---|---|--------------|-------------------|---------------|
| Entrepreneurial vitality            | N.A                 | Average monthly increase in the number of startups (normalized by the number of inhabitants) i)     | Teleport (2019)*                              | STAR         |                   |               |
| Entrepreneurial attractiveness      | N.A                 | Number of investors (normalized by the number of inhabitants)                                       | Teleport (2019)*                              | INV          | N.A.              | ENT           |
| Mentoring and Managerial Assistance | N.A                 | Accelerated startups (normalized by the number of inhabitants)                                      | Gust (2016)**<br>Seed DB (2016)**             | ACC          |                   |               |
| Entrepreneurial success             | N.A                 | History of highly successful digital companies (unicorns) (normalized by the number of inhabitants) | GP Bullhound (2016)**<br>CB Insights (2016)** | UNI          |                   |               |
| Economy                             | Labour market       | Ease in finding a job   |   | ECO 1        |                   |               |
|                                     | Financial situation | Satisfaction with the financial situation of your household   |   | ECO2         | ECO               |               |
|                                     | Taxation            | Difficulty paying bills at the end of the month (inverted value)                                    |   | ECO2         |                   |               |
| Governance                          | Efficiency          | Satisfaction with the efficiency of administrative services of your city                            |   | GOV 1        |                   |               |
|                                     | Allocation          | Satisfaction with the way your city spends its resources  |   | GOV2         | GOV               |               |
|                                     | Trust               | Satisfaction with the public administration   | Eurostat (2015)***                            | GOV3         |                   |               |
| People                              | Integration         | Satisfaction with the integration of foreigners who live in your city                               |   | PEO 1        |                   |               |
|                                     | Perception          | Satisfaction about the presence of foreigners in your city  |   | PEO2         | PEO               |               |
|                                     | Trust               | Satisfaction with the credibility of individuals  |   | PEO3         |                   | HUI           |
| Welfare                             | Health              | Satisfaction with the healthcare services offered by doctors and hospitals                          |   | WEL1         | WEL               |               |
|                                     | Safety              | Satisfaction with the safety of your neighborhood   |   | WEL2         |                   |               |

*Source: our elaboration*

*From variables to sub-indexes and indexes*

The methodology employed in this study is based on a formative approach, according to which the latent factor (entrepreneurship and well-being) depends on the indicators that “explain” the factor, and not vice versa (Diamantopoulos et al. 2008). This implies that the variables are functional to the definition of the phenomenon under study (Maggino, 2017). Our analysis is based on the Poset methodology, a quantitative non-aggregative analytical approach used to compare different statistical units (Ivaldi et al., 2020 b). Poset makes it possible to establish unequivocally whether or not it is appropriate to compare the different statistical units making up a distribution.

Graphically, Poset is expressed through a tool called *Hasse* diagram. The *Hasse* diagram is composed of the following elements: the nodes, which correspond to profiles, each one identifying a statistical unit; a connector, or line, which unites the comparable elements, while it is absent if it is not possible to determine with certainty the prevalence of one statistical unit over the other.

The existence of incomparability, which is reflected in the partiality of the systems and in the impossibility of answering immediately to all the questions in a comparative perspective, is a direct consequence of the complexity and multiformity of a given phenomenon. It is necessary to bump into with these characteristics, so typical of multidimensional evaluation problems, and even take advantage of them (Fattore et al., 2011).

According to Fattore (2017), after assigning the evaluation scores to the elements of a Poset, the elements can be ordered in a linear order. In other words, we can assign a score to each element of a finite poset; the score represents the position of the elements in a “low-high” axis (Fattore et al., 2019). After having arranged all the linear extensions, we must calculate the height of each linear extensions,

defined as 1 plus the number of elements below  $x$  in the linear order; then, for each element of the poset, we compute the average height  $[0, 1]$  on its linear extensions, corresponding to the arithmetic mean of the heights of  $x$  in all linear extensions (ibidem).

In addition to the poset analysis, for each group of cities, we conduct a k-means cluster analysis (Hartigan and Wong, 1978) to perform a bivariate classification of the countries according to both ENT and HUI.

## RESULTS AND DISCUSSION

All procedures were conducted using the R software. The partial orders in socio-economics (PARSEC) package was used for the poset elaboration (Arcagni and Fattore, 2019).

### *Average height and Correlation matrix*

The application of the average height allowed us to obtain synthetic measures for the performance of different cities in different fields of analysis. We also measured the performance by the sizes of cities (large, medium, and small). Higher values identify better situations and vice-versa. This measure is an index based on the possibility to compare different cities and the structure of the profiles of the cities. Table 3 presents the value of the average height for each statistical unit, for ENT and HUI of the sampled EU cities. The top 10 cities' ENT and HUI are located in the northern range.

Table 3: ENT and HUI: General average height and performance of each city group

| Cities (43) | ENT  | Cities (43) | HU<br>I | Range         | Group  | Cities     | EN<br>T | Cities     | HU<br>I | Range         |
|-------------|------|-------------|---------|---------------|--------|------------|---------|------------|---------|---------------|
| London      | 41,6 | Munich      | 40,0    |               | Large  | Berlin     | 10,5    | London     | 10,1    |               |
| Berlin      | 41,6 | Copenhagen  | 38,7    |               | Large  | London     | 10,5    | Manchester | 9,2     |               |

Source: our elaboration

In order to answer RQ1, a Spearman's correlation matrix was constructed. The Spearman's index value of 0.09 reveals that there is no correlation between ENT and HUI for the entire sample (43 cities). Hence, we decided to analyze large-sized cities defined on the basis of their size. In large cities (n=11 cities), we found a significant Spearman's correlation between ENT and HUI. For medium-sized

(n=21) and small (n=11) cities, all the relationships were not significant and were sometimes negative. For large cities, we found a positive relationship between entrepreneurship and the population (0.7), while the correlation between HUI and population was not significant (Table 4).

Table 4: Spearman's correlations between ENT, HUI, and population for each group of cities

|              | HUI-ENT | ENT-population | HUI-population |
|--------------|---------|----------------|----------------|
| Large-sized  | 0.5     | 0.7            | 0.2            |
| Medium-sized | 0.3     | 0.3            | 0              |
| Small-sized  | -0.5    | -0.6           | 0.3            |

\*\*  $p < 0.01$ , \*  $p < 0.05$  (two-tailed).

In order to identify which important dimensions of the quality of life trigger entrepreneurial activities (RQ2), we perform a Spearman's correlation matrix for each group of cities. For large-sized cities, the correlation between ENT and welfare dimension (WEL) was highly significant and positive (0.7). There was a positive correlation between entrepreneurship and the perceived quality of life in terms of ECO (0.5), ENV (0.6), and ICT/MOB (0.5).

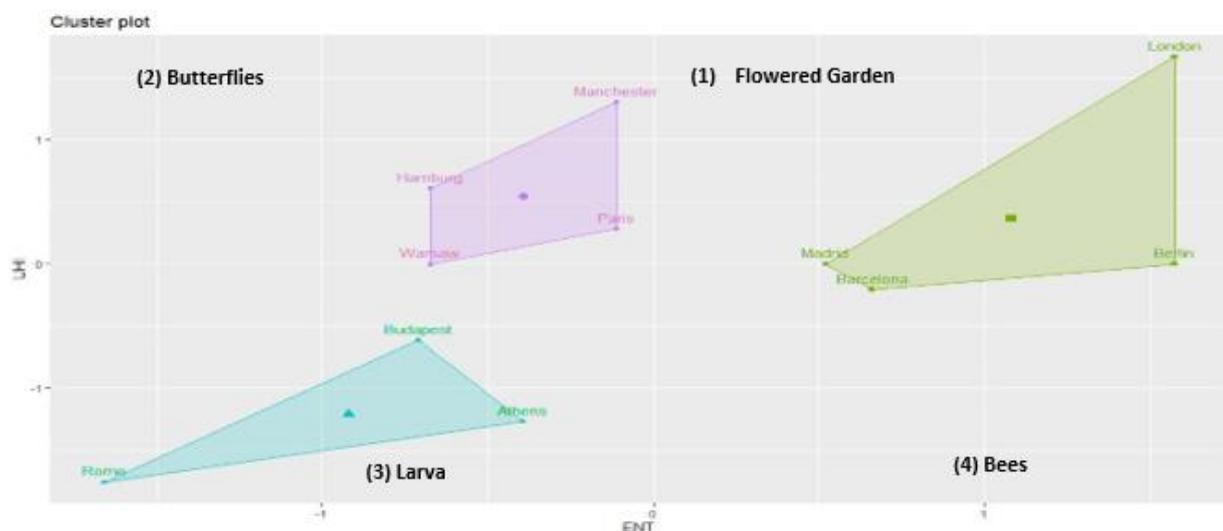

#### *The results focused on large-sized cities*

For large-sized cities, the correlation matrix demonstrates a positive relationship between ENT and HUI (0.5). Moreover, for these cities, the most important subjective indexes of the quality of life that share a positive relationship with ENT are WEL (0.7), ENV (0.6), ECO (0.5), and ICT&MOB (0.5). A positive evaluation of the urban system of welfare, transport, and environment services can provide an "economic leverage," as seen empirically in Ivaldi et al. (2020 b). Considering that the correlation analysis provides only synthetic results, our research also analyzed the position of each city in relation to others belonging to the same urban-sized group. Focusing on the large-sized cities, London and Berlin exhibited the best performance in terms of ENT (average height = 10.5). London is also characterized by a positive perception of quality of life (HUI = 10.1). Cities that lack a correspondence between the values of the average height in terms of ENT and HUI are mainly Hamburg (ENT = 4.1, HUI = 7.5) and Manchester (ENT = 5.7, HUI = 9.2). They show a good HUI (2<sup>nd</sup> and 3<sup>rd</sup>, respectively); however, they have a lower ENT (8<sup>th</sup> and 5<sup>th</sup> respectively). On the basis of the average height in terms of ENT and HUI, we construct a cluster analysis for each urban-sized group (figure 1 a, b, c). For each urban-sized group, we identified four clusters corresponding to four different urban styles. The first cluster comprises cities with a high quality of life and a good entrepreneurship ecosystem (ENT+; HUI+). The presence of an effective entrepreneurial system and positive perceptions of the quality of life are the most important dimensions of smart cities. We name this cluster as the flowered garden because it provides an ideal environment for the creation of the virtual circle of prosperity for entrepreneurial activities (bees) and satisfied citizens (butterflies). In these cities, the perceived high quality of life (butterflies) contributes toward attracting and retaining entrepreneurship, while

entrepreneurship (bees) contributes toward enhancing the perceived quality of life by providing wealth and stimulating innovation, new services, and amenities.

Named “butterfly”, the second cluster comprises cities with a relatively poor entrepreneurship but with a good perceived quality of life (ENT -; HUI+). These cities must improve business conditions as well as stimulate entrepreneurial attitudes and aspirations in order to create a good ecosystem for bees (Porter, 1996). The third cluster (ENT-; HUI-) is formed by “outsider” cities. Referred to as “larva”, these cities have a low perceived quality of life and poor entrepreneurship conditions. Among the large-sized cities, this cluster includes Rome (ENT=1.3, HUI=1.7), Athens (ENT=4.9, HUI=2.9), and Budapest (ENT=4, HUI=4.5). The administrators of these cities must realize that the growth of entrepreneurial aspirations (bees) and business investors is related to the quality of life as perceived by the citizens (butterflies). They should also realize that the capacity to nurture entrepreneurial activities creates the premise for an increase in the quality of life. With proper policies, larva cities can be transformed into butterfly or bees and/or, subsequently, into a flowered garden. The fourth cluster depicts a “beehive” ecosystem oriented to entrepreneurial activities. In the medium-long term, entrepreneurial activity can be adversely affected by the negative perception of residents on their life quality. In this vein, residents can be attracted by other cities in search of better amenities, thereby constraining the development of entrepreneurial activity in their home city. These cities are “beehives” that nurture entrepreneurs; however, these cities must implement immediate intervention to create butterfly factors in order to improve their residents’ perception of well-being and activate the flowered garden.

*The hierarchy for large-sized cities*

In order to better understand the ENT and HUI, we use the poset methodology; the Hasse diagrams helps to ordinate the cities from the top- to the lower level, identifying the position of superiority on the basis of the single variables. We focus only on the large-sized cities. Figure 1a represents the results of the cluster analysis for big cities—London (ENT=10.5, HUI=10.1), Berlin (ENT=10.5, HUI=6), Madrid (ENT=7.5, HUI=6), and Barcelona (ENT=7.9, HUI=5.5) are considered “flowered gardens” because they present a good entrepreneurial system and a good perception of the quality of life. It is not a coincidence that no pure “bees” are present among the large cities; consistent with Florida et al. (2013), large-sized cities tend to witness a high perceived quality of life. Figure 2 presents the Hasse diagram, that is, the poset hierarchy. In terms of ENT, London prevails over all cities, except for Berlin (Figure 2a). Looking at the single variables, London ranks first only for the variables STAR (13.65), INV (160.23), and ACC (0.80); Berlin prevails over London only in for the variable UNI (unicorns) (1.18 vs 1.08), which explains the impossibility of comparing according to the theory of the partially ordered sets—Berlin and London. In this vein, London seems more oriented to support new entrepreneurial activities (start-ups that prevail in London are service-oriented to support start-ups), while Berlin presents an entrepreneurship model where unicorns are present (Acs et al., 2017). In case of the “flowered garden” cluster, Madrid (ENT = 7.9) and Barcelona (ENT =7.5) rank 3<sup>rd</sup> and 4<sup>th</sup> as “entrepreneurial” cities. It is not a coincidence that the top ENT cities have recently implemented public policies to promote entrepreneurship. These policies aim to enhance competitiveness at the city and national levels and attract investors. Concerning the “butterfly cities,” Paris (ENT=5.7, HUI=6.7) and Manchester (ENT=5.7, HUI=9.2) present good values, respectively, for the variables INV (33.63) and UNI (0.31). In particular, Paris cannot be compared with Barcelona and Madrid as Paris prevails in the case of variables INV (33.63 vs 29.64 and 21.46) and UNI (0.25 vs 0.18 ad 0.00), demonstrating its ability to attract investors (INV) and support highly successful digital companies (UNI). Manchester is ranked lower than Berlin and London, in terms of all the ENT variables. Nevertheless, Manchester holds the 3<sup>rd</sup> position for UNI (0.31), only after London and Berlin. Concerning the other variables, Manchester oscillates between the 8<sup>th</sup> Position (STAR 2.46) and 10.5<sup>th</sup> position (UNI 0.00). Among Larva clusters, despite being placed at the lowest level of the ordered structure in terms of ENT, Athens (ENT=4.9, HUI=2.9) holds the 3<sup>rd</sup> position in terms of ACC (0.52), but the lowest in terms of STAR (0.52). Hence, Athens is located at the bottom of the graph. Rome (ENT=1.3, HUI=1.7) is the worst city for ENT; it oscillates between the 10<sup>th</sup> and 11<sup>th</sup> positions for all variables. The same analysis has been carried out for HUI. At the bottom of the Figure 2, lower-ranked cities or completely incomparable cities have been depicted. Consistent with the classification of the “flowered garden,” London is ranked as the top city in terms of the HUI (10.1). Concerning the perceived quality of life, London ranks 1<sup>st</sup> for the sub-dimension ENV (average height=10) and 2<sup>nd</sup> for sub-dimensions GOV

(9.8), PEO (8.7), CUL (8.5), and ICT & MOB (9.3). Its tailor-made public policies would ensure that London sustains its success as the United Kingdom's only global city' and a smart city (Turok, 2008).

Figure 2: Large-sized cities' Hasse diagram for ENT (a) and HUI (b)

London is also a top-ranked city in terms of ENT. Hamburg is a “butterfly city”; it is “dominated by London” (Figure 2b) in all the HUI dimensions, but it is considered a good city and comparable (with the same average height) to London in regard to ECO (9.1), PEO (8.7), CUL (8.5), and ENV (10). Among the German cities, Hamburg is known for its lowest unemployment rate and remains particularly attractive to young people (Grossmann, 2006). These elements form the premises for the attraction of entrepreneurial activities. Manchester also ranks best in the ENT domain; it is perceived the best city for GOV (11), WEL (10.1), and ENV (10), owing to important public policies. Manchester is not dominated by any city in regard to GOV. It is important to notice that Berlin and Madrid do not share any relationship of comparability with the other cities. Nevertheless, Berlin holds a 5<sup>th</sup> position; the city is perceived good by its inhabitants for its environment (ECO 9.1) and ICT & MOB (10.6).

These factors are important not only for the perceived quality of life but also for the development of a good environment for ENT. Concerning the performance of the Spanish cities in terms of HUI in the flowered garden cluster, Madrid holds the top position in terms of the perceived PEO (9.7). Although Barcelona does not hold top values, it ranks high for WEL (9.6), owing to the smart city policies aimed to make the city more compact and well-lived (Camboim et al., 2019). Considering that Madrid and Barcelona rank high in terms of ENT, this result supports the relevance of informal factors connected to social norms in Spain (Alvarez et al., 2011).

## **CONCLUSIONS, IMPLICATIONS AND FURTHER RESEARCH**

This study examines the relationship between the perceived quality of life and entrepreneurship at the urban level. The analysis was performed on a sample of 43 smart cities, comprising 28 EU capital cities and 15 non-capital cities. The sub-groups of cities were created on the basis of the urban size. We focus on large-sized cities. First, the correlation analysis shows that entrepreneurship is positively related to the perceived quality of life only in large cities. The findings reveal that a high HUI score is a valuable predictor of ENT at the city level; it confirms that a good city climate stimulates the creation of new and innovative entrepreneurial activities. For the large cities, the positive perception of WEL, ECO, ENV, and ICT&MOB dimensions enhance the entrepreneurial attitude. Our cluster analysis shows that the flowered garden represents the ideal environment for the creation of the virtual circle of prosperity for bees (entrepreneurial activities) and butterflies (satisfied citizens). With proper business-related and smart city policies, the cities in the larva cluster can be transformed into butterflies or bees and/or, subsequently, to a flowered garden. For butterfly cities, it will be crucial to improve business conditions and stimulate entrepreneurial attitudes. However, the entrepreneurial activity of cities in the bee cluster can be adversely affected by the negative perception of residents on their life quality. Flowered Garden has demonstrated the relevance of the implementation of urban strategies aimed at creating a good environment and stimulating entrepreneurship.

The findings suggest that public policies should increase business competitiveness, positively impacting investment, jobs, inhabitants, and visitors. Such policies will help inhabitants, businesses, and institutions experience a new sense of purpose and direction in the city, and thereby contribute toward enhancing the city's reputation. Our study contributes to the debate on urban quality of life and entrepreneurship by providing useful insights to academics and urban policymakers. In terms of theoretical implications, our research advances the body of knowledge in the entrepreneurship literature by bringing together the regional system of entrepreneurship (Szerb et al., 2013; Acs et al., 2014) and the quality of life and well-being dimensions at city (Florida et al., 2013) and smart city levels (Nam and Pardo, 2010); it also develops synthetic indexes to test the relationship between

the perceived quality of life and entrepreneurship. It stimulates the debate on the role of smart cities in promoting entrepreneurship, which currently is an under-investigated topic, especially at the European level. In terms of practical implications, the study may explain policy makers/city managers the importance of the perceived quality of life and indicate the drivers responsible for the creation of an attractive entrepreneurial environment. This study has some inherent limitations to be addressed by future research. First, the investigation is performed on EU cities alone. Second, based on cross sectional data, our analysis fails to capture any causality between HUI and Entrepreneurship; this issue should be resolved in the future research. In addition, the number of variables and attributes that refer to each dimension may be expanded, embodying additional perspectives that could reasonably contribute toward a better understanding of the determinants affecting the development of urban-level entrepreneurship.

## ARE ASIAN UNICORNS IMMUNE TO COVID-19? A “LIVE” ASSESSMENT

**Pérez-Morón, James; Marrugo-Salas, Lina; Tordecilla-Acevedo, Veronica**

College of Business, Universidad Tecnológica de Bolívar, Cartagena, Colombia

### ABSTRACT

Coronavirus Disease (COVID-19) has severely hit all sectors of the economy and has threatened the expansion of unicorn firms (companies with a market value of USD 1B+). This paper intends to perform a live assessment of the impact of the COVID-19 pandemic upon unicorn firms in Asia based on a review of current events and a review of the available literature using Clarivate Analytics' Web of Science (WoS) and Scopus. The findings reveal that there have been spillovers into unicorn categories. Asian unicorns face profitability issues and are experience funding scarcity with venture capital firms being conservative towards investing, all of which can lead to a revision of their valuation that may mean they lose their unicorn status. The authors end this research with potential topics and directions for future research.

To the best of the authors' knowledge, this is one of the first studies that addresses the influence of COVID-19 on Asian unicorns and has the intention of contributing to filling this research gap.

*Keywords: Asia, COVID-19, Startups, Unicorns, Unicorn Firms.*

### INTRODUCTION

COVID-19 (also known as the “coronavirus”, “2019 novel coronavirus” or “2019-nCoV”) originated in Wuhan city, Hubei province in China (McKibbin and Fernando, 2020), and disrupted Chinese economy and society with 84,544 confirmed COVID-19 cases and 4,645 deaths as of May 11, 2020 (World Health Organization- WHO, 2020). It is now a global pandemic (Kuckertz et al, 2020), with recent COVID-19 epicenters in the United States of America, Brazil, the Russian Federation, and the United Kingdom (WHO, 2020).

COVID-19 is an acute crisis and is completely different from previous crises classified as such, including hurricane Katrina in 2005, the 2008 financial crisis (Kuckertz et al, 2020), the Asian debt crisis of 1997, the 2016 recession in Nigeria or the 2010 recession in Greece (Ozili and Arun, 2020). This pandemic has imposed unprecedented challenges upon humankind, and all economic sectors (Horowitz, 2020; Elliot, 2020) need to adapt to a new reality and a future wherein business approaches

must be reconsidered (Ting, Ling and Cheah, 2020). This includes both small businesses (the hardest hit by COVID-19) (Baker and Judge, 2020) and unicorn firms.

The concept of unicorns was coined in 2013 and refers to firms that reach a market value of USD 1B plus (Lee, 2013; Henrekson and Sanandaji, 2019; Gornall and Strebulaev, 2020). Unicorns are also known as “tech-startups” with a repeatable and scalable business model (Aldrich and Ruef, 2018; Blank and Dorf, 2013). Decacorns and Hectacorns are valued at USD 10 billion-plus and USD 100 billion-plus, respectively.

As of May 2020, there were 448 unicorns worldwide according to CBInsights (2020), the most reputable list of unicorn firms (Lougen, 2017).

Asia is threatening North America's dominance with astonishing growth in recent years. For example, China (the unicorn champ in Asia) went from zero unicorns in 2013 to 56 in 2014 and then to 109 in 2020, threatening the United States' dominance of the unicorn list in recent years. North America has the highest distribution of unicorns in terms of value, while Asia is the leader in terms of overall market value. The highest valued unicorns in the world are from China: Toutiao (Bytedance) with a valuation of USD 75 billion and Didi Chuxing with USD 56 billion. Taiwan and Macao have no unicorns in their territories. This is a live assessment of the impact of COVID-19 upon unicorns in Asia and will need to be revisited as the pandemic unfolds. To the best of the authors' knowledge, this is one of the first studies to address the influence of COVID-19 upon Asian unicorns and intends to help fill this research gap.

This study is guided by the following main research question: In what ways has the COVID-19 pandemic influenced unicorns in Asia? The remainder of the paper is organized as follows. The next section contains the method used to perform the literature review. Then, results analyses and data visualizations are presented. Finally, a discussion of the findings is offered together with possible directions for future research in the final section.

## **METHODOLOGY**

Based on previous reviews (Canabal & White, 2008; Shen, Puig, & Paul, 2017), the authors performed manual and electronic research of journals indexed in Scopus and Clarivate Analytics' Web of Science (WoS) and included in the Emerging Sources Citation Index (ESCI) and the Social Sciences Citation Index (SSCI) with a high impact quality factor (Paul and Mas, 2019) and dated between 2000 and 2019. The authors included different combinations of the following keywords: “*unicorn*”, “*unicorns*”, “*unicorn firms*”, “*unicorn startups*” and “*unicorns in Asia*” for a more comprehensive search. The search

used both “free terms” and “index terms” funneled using AND, AND NOT and OR Boolean operators.

After selecting the search terms, the search returned 916 documents published in journals and containing the selected terms in their title, abstract, and/or keywords. After eliminating duplicate articles, the list contained 614 unique focal articles. The authors then thoroughly reviewed the abstracts to validate each article’s relevance, using methods proposed by Mayrhofer (2004), Dikova and Brouthers (2016), and Paul, Parthasarathy, and Gupta (2017). Business Collection was selected as a filter, reducing the number of documents to 69. Finally, only articles were selected, excluding reviews, book chapters or editorial notes. This iterative process resulted in a final set of 25 focal documents from 23 journals. The authors selected two unicorn categories as a sample (Fintech and Healthcare) due to the availability of information.

## RESULTS

With 122 citations, the article by Acs, Stam, Audretsch, and O’Connor (2017) provides an explanation of economic ecosystems. Specifically, it shows the contributions made to entrepreneurial ecosystems and concludes with a new line of research that seeks to explain the emergence, development and context of new companies that have had an important impact by controlling new platforms. The article by Miller and Acs (2017), with a total of 28 citations, uses Frederick Jackson Turner's thesis on American democracy to build a framework for understanding the US university campus as an entrepreneurial ecosystem. The third publication, with 25 citations, is an article where Canniford (2005) discusses certain problems associated with ethnography in global cultures. Its value lies in its reevaluation of the experience of global culture in the world’s surf scene. It provides a practical solution for cultural research and highlights the importance of a red-light approach to constructing an appropriate theory. 2019 was the most productive year with five articles. 65 authors were involved in a total of 19 documents found. Acs, Z.J has the greatest participation with a total of two publications. The remaining 64 authors have only one publication.

### *Data Visualization*

This research used VOSviewer software to create a bibliographical map containing co-occurrence, co-authorship, and co-citation.

### Co-occurrence

Co-occurrence analysis was used for this map. The unit of analysis was all keywords and the counting method was complete. The minimum number of occurrences of a keyword was one. 165 keywords met the proposed limit. The keyword with the highest connection strength was “unicorns”, with a total of 42 links; followed by “innovation” with 34, “entrepreneurship” with 23 and “business model” with 21 (Figure 1).

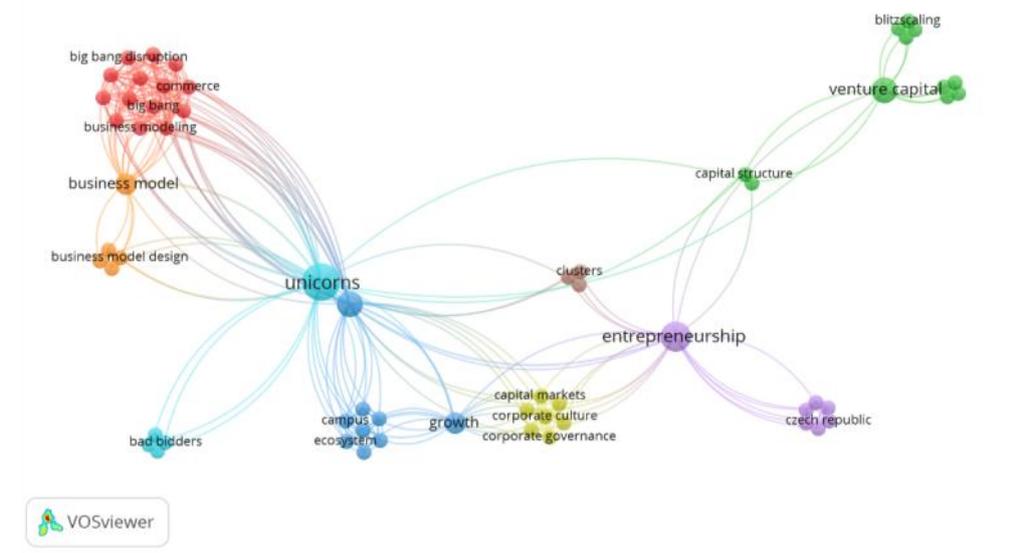

Figure 1. Word co-occurrence map (full counting)

### Co-authorship by country

The authors ran this map using a co-authorship analysis. The unit of analysis was per country and the counting method was complete. The minimum number of documents chosen per country was one. The authors observed a small cluster of countries with connections between them: The United States, Canada, the United Kingdom, Denmark, Australia, Taiwan, the Netherlands, and Japan. Finally, concerning connection strength, the authors found that the country with the highest connections is the United States with seven, followed by the United Kingdom with five. There are other countries with a connection strength of zero that do not appear on the map: Czech Republic, Germany, India, Italy, New Zealand, and Sweden.

### Co-citation

The authors ran this map using co-citation analysis. The unit of analysis was cited sources and the counting method was complete. The minimum number of citations per established source was two and, of 727 sources, only 145 met this condition. The map returned a high connection strength. The

highest was 1468, obtained by the “Small Business Economics” magazine, followed by the “Journal of Business Venturing” with a connection strength of 782. Finally, “Entrepreneurship Theory and Practice” had a connection strength of 420.

## DISCUSSION

Intellectual output by unicorn companies is low but has been increasing. In Asia, China is the leader in terms of performance and dominance; it is also the second country with the highest presence of unicorn companies (Marrugo et al 2018).

All countries around the globe have developed policies to fight the COVID-19 pandemic. China: 1) Granting regulatory forbearance to banks, and principal or interest moratorium to debtors affected by COVID-19. 2) Central banks’ provision of liquidity to financial (bond and equity) markets. 3) Public quarantine. 4) Social distancing policy. 5) Travel ban. 6) Visa denial and suspension. Japan and South Korea: 1) Lowering interest rates by Central banks. 2) Public quarantine. 3) Social distancing policy. India 1) Provision of income support for individuals. 2) Public quarantine. 3) Border quarantine. 4) Social distancing policy. 5) Shutdown of air, land, and sea borders. Singapore 1) Social distancing policy. 2) Visa denial and suspension

Some documents have a high status while simultaneously being private, making it difficult for authors who need use the information contained in them to freely access these documents. Many of these texts prepared by private companies are available to researchers under Non-Disclosure Agreements (NDA) if the information is used in a truthful and correct manner (Cortés-Sánchez, 2020; Kodynetz & Maidanyk, 2019). Here is a breakdown of unicorns per Asian country China 109, Hong Kong 3, India 20, Indonesia 5, Japan 3, Israel 7, Philippines 1, and Singapore 2.

The following table summarizes all existing unicorns in Asia organized by category.

| Category                    | Companies   |
|-----------------------------|---|
| Artificial Intelligence     | China: Toutiao (Bytedance), SenseTime, Face++ (Megvii), Cloudwalk, Horizon Robotics, YITU Technology, Cambricon, Preferred Networks, 4Paradigm, iCarbonX, Momenta, Unisound, Intelifusion. Israel: Infi, OrCam Technology, Lightricks. Singapore: Trax. |
| Auto & Transportation       | China: Didi Chuxing, Hello TransTech, Xpeng Motors, Youxia Motors, Lixiang Automotive, BYTON, CAOCAO, AIWAYS, Tuohu, Leap Motor, Banma Network Technologies. India: Ola Cabs, Ola Electric Mobility. Israel: Gett. Singapore: Grab.                     |
| Consumer & retail           | China: EasyHome, MINISO Life, Trendy Group International, Yijijupu (易极). South Korea: L&P Cosmetic.   |
| Cybersecurity               | China: Tongdun Technology.  |
| Data management & analytics | China: Jusfoun Big Data, DT Dream.  |

|                                     |  |
|-------------------------------------|--|
| E-commerce & direct-to-consumer     | China: Guazi (Chehaoduo), Lianjia (Homelink), Ziroom, VANCL, Xiaohongshu, SouChe Holdings, Aihuishou, Huimin, eDaili, Koudai, Miaoshou Doctor, Jiuxian, Womai, Fanli, BeiBei, Zhaogang, Mia.com, Mofang Living, Zhuan, JOLLY Information Technology, KK Group. India: Snapdeal, Lenskart. Indonesia: Tokopedia, Bukalapak. South Korea: Coupang, Wemakeprice, MUSINSA. |
| EdTech                              | China: Vipkid, Yuanfudao, Luoji Siwei, iTutorGroup, HuJiang, 17zouye, Huike Group, KnowBox. India: BYJU'S.   |
| Fintech                             | China: CGTZ, Linklogis, 100credit. Hong Kong: WeLab. India: One97 Communications, BillDesk, Pine Labs, PolicyBazaar. Indonesia: OVO. Japan: Liquid. South Korea: Viva Republica (Toss).  |
| Hardware                            | China: DJI Innovations, Bitmain Technologies, UBTECH Robotics, Royole Corporation, Meizu Technology, Coocaa, Geek+, China Cloud, Terminus Technologies, Orbbe Technology. Israel: Infinidat  |
| Health                              | China: GuaHao (We Doctor), United Imaging Healthcare, Gan & Lee Pharmaceuticals, Ding Xiang Yuan, Medlinker, LinkDoc Technology. South Korea: Aprogen.   |
| Internet software & services        | China: Beike Zhaofang, Zhihu, Xinchao Media, WTOIP, Nxin (农信互联), 58 Daojia, Kujiale. India: Zomato, Dream11.   |
| Mobile & telecommunications         | China: Kuaishou, Meicai, Huaqin Telecom Technology, Yixia, Apus Group, LinkSure Network, Yidian Zixun, Poizon, Wacai, Maimao. India: Hike, InMobi. Israel: ironSource, AppsFlyer. Japan: SmartNews. South Korea: Yello Mobile.   |
| Other                               | China: Ucommune, Dadi Cinema, Aijia Life, Perfect Diary. Philippines: Revolution Precrafted. India: ReNew Power. South Korea: Krafton Game Union, GPClub.  |
| Supply chain, logistics, & delivery | China: Manbang Group, Yiguo (易国), Yimidida, YH Global, Dada-JD Daojia, Shansong Express (FlashEx). India: Swiggy, Udaan, Delhivery, BigBasket, Rivigo. Indonesia: Go-Jek. Hong Kong: Lalamove.   |
| Travel                              | China: Mafengwo, Tujia, XiaoZu. India: Oyo Rooms. Indonesia: Traveloka. Hong Kong: Klook. South Korea: Yanolja.  |

Table 1. Unicorns in Asia.

Source: Authors based on CBinsights (2020).

The Asian unicorn scene is dominated by the e-commerce sector, followed by auto transportation, supply chain, mobile & telecommunications, and artificial intelligence. The following table (2) presents the top 10 highest-value unicorns in Asia, all of them Hectacorns. 80% of these are in China and India (known collectively as *Chindia*), 10% are in Singapore and 10% in Indonesia.

| Company              | Valuation (\$B) | Country | Category                    |
|----------------------|-----------------|---------|-----------------------------|
| Toutiao (Bytedance)  | \$75,0          | China   | Artificial intelligence     |
| Didi Chuxing         | \$56,0          | China   | Auto & transportation       |
| Kuaishou             | \$18,0          | China   | Mobile & telecommunications |
| One97 Communications | \$16,0          | India   | Fintech                     |
| DJI Innovations      | \$15,0          | China   | Hardware                    |

|                      |        |           |                                     |
|----------------------|--------|-----------|-------------------------------------|
| Grab                 | \$14,3 | Singapore | Auto & transportation               |
| Bitmain Technologies | \$12,0 | China     | Hardware                            |
| Go-Jek               | \$10,0 | Indonesia | Supply chain, logistics, & delivery |
| Beike Zhaofang       | \$10,0 | China     | Internet software & services        |
| Oyo Rooms            | \$10,0 | India     | Travel                              |

*Table 2. Top 10 unicorns in Asia*

*Source: Authors based on CBInsights (2020)*

#### *Spillover to Venture Capital Firms*

The value of privately held unicorns grew exponentially from 2013 until the 3rd quarter of 2019. Venture capital investments in China in 2018 (USD 71 billion) surpassed the US market (USD 70 billion) and China's Pearl River Delta is seeing more activity than Silicon Valley (Alon et al, 2018). In Asia, the average time to become a unicorn is six years, while 18% of unicorns took more than nine years to achieve this status. There were more unicorn exits (the moment a unicorn goes public or is acquired it is no longer considered a unicorn) from North America than from Asia in 2019 (Statista, 2020). Table 3 breaks down the number of Asian unicorns exits versus North American ones.

| Year               | Asia (quantity) | North America (Quantity) |
|--------------------|-----------------|--------------------------|
| 2011               | 1               | 3                        |
| 2012               | 0               | 3                        |
| 2013               | 0               | 3                        |
| 2014               | 3               | 8                        |
| 2015               | 1               | 10                       |
| 2016               | 4               | 9                        |
| 2017               | 7               | 11                       |
| 2018               | 22              | 21                       |
| 2019               | 13              | 23                       |
| 2020*(as of 01/20) | 0               | 1                        |
| Total              | 51              | 92                       |

*Table 3. Asian vs. North American unicorn exits. 2011-2020*

*Source: Authors based on Statista (2020).*

In terms of the global deals, funding declined during the final quarter of 2019 when COVID-19 appeared in Wuhan, China in December of that year to then spread all over the world (Filipe, 2020). COVID-19 began shaking unicorn deal activities worldwide, with global funding falling 16% in Q4'19 compared to Q3'19, and global financing down 12%. In Q4'19, Asia had a total of 1,381 deals with USD 13,5B invested compared to Q4'18 where it saw 1,366 deals. However, in general, financing declined globally overall.

#### *Spillover to Fintech unicorns*

Currently, there are 67 fintech unicorns in the world valued at USD 252,6B, broken down as follows: North America with 38, Europe with 12, South America with three, Australia with two and Asia with 12. The top five most valuable fintech unicorns can be found below

Stripe United States \$36B, Nubank Brazil \$10B, Ripple United States \$10B, Coinbase  
 United States \$8B, Robin Hood United States \$7,8B CBInsights (2020).

Fintech saw its worst Q1 since 2016 for fintech deals and its worst Q1 for funding since 2017 (CBInsights, 2020). *“China saw its worst quarter for fintech since 2015 as the country shut down to fight the first coronavirus outbreak, with just 29 deals totaling \$175M in Q1’22. As the first country to fight and start to recover from coronavirus, what happens in China could be a gauge of what is ahead for fintech as the virus spreads across other regions”* (CBInsights, 2020). Fintech unicorn birth and exits data during COVID-19 is also shown below. From January to April 2020, only three unicorns were born: Pine Labs (USD 1.6B) in Asia, and Flywire and Highradius with USD 1B each, both from North America. On the other hand, several fintech exits have occurred

Acquirer, Target and Value (USD): Morgan Stanley E\*TRADE \$13B, Intuit Credit Karma  
 \$7.1B, VISA PLAID \$5.3B, Ally CardWorks \$2.65B, SoFi Galileo \$1.2B,  
 LendingClub Radius Bank \$185M

#### *Spillover to Healthcare unicorns*

There are 42 Healthcare unicorns worldwide, valued at USD 101.5B and distributed as follows: 21 in the United States, ten in Asia (nine in China and one in South Korea), nine in Europe, and two in the Middle East. The COVID-19 pandemic helped the healthcare unicorn club grow with developing trends like telehealth, medical devices, and mental health. In China, healthcare unicorns were hit with a reduction of deals of over 50%, quarter over quarter.

Insurance unicorns waived COVID-19 related expenses and face a challenge to adjust future operations as the global unemployment rate becomes the next pandemic. Several healthcare unicorns also formed partnerships *“to accelerate development of and expand access to COVID-19 tests, vaccines, treatments, and critical medical equipment”* (CBInsights, 2020), this is expected to become a permanent situation in the post-COVID-19 era depending on the success rate of such collaborative work.

Telehealth has been another winner under COVID-19. Patients are becoming accustomed to it and providers are overcoming different challenges, for example those related to reimbursement policies. It is also expected that this affordable trend will become part of daily life in a post-COVID-19 world. Startups to highlight include *Alto*, a Telepharmacy startup that provides delivery of prescriptions, phone support, and works closely with doctors and insurance companies, and Teletherapy startups with great success like *Lyra* (mental health), *Halcyon health* (behavioral health) and *HingeHealth* (physical health). Medical devices have also seen development due to the COVID-19 pandemic, mostly to improve infectious disease diagnostics. This includes companies like *Karius*, *Lucira Health*, *Mammoth Biosciences* and *Outset Medical*.

Digital Health in China in Q1'20 (USD 318M with 27 deals) has gone back to Q2'17 levels (USD 167M with 25 deals). However, several Chinese companies have been boosted during COVID-19: WeDoctor (微医集团): Global consultation platform; DXY.cn (丁香园): Provides a map that tracks COVID-19 in China; Spring Rain Software (also known as ChunyuYisheng): Online consultations; Zhangshang Tangyi (Literal translation: Mobile Sugar Doctor): A diabetes management app; Nuanwa Technology: Health Insurance Infrastructure; Insgeek: Group Health Insurance Platform; MediTrust Health: Drug & Diagnostics Access Solutions

### *Spillover to Investors*

In Q1'20, the COVID-19 pandemic forced investors to reduce investment and focus on strengthening portfolios. This research also found that several unicorns do not generate profits, including Communications (USD 16B), Ola Cabs (USD 6.3B), and Swiggy (USD 3.3B). The ability to generate profits is being observed in detailed by all investors. The other challenge faced by Indian unicorns is related to raising capital. Chinese investors (who invest the most in India), are experiencing investment restrictions. However, they still have the capital to take on a longer lockdown.

Based on this, unicorns expect their valuation to be revised shortly, which may potentially result in a loss of their unicorn category. The COVID-19 pandemic is benefiting multiple Indian unicorns including BigBasket (Supply chain, logistics, & delivery) due to an increase in e-commerce, BYJU'S (Edtech, online education) and Policybazaar (Fintech, life insurance products).

## **CONCLUSIONS**

2020 has brought about a recession unprecedented in modern history due to COVID-19. In this article, the authors have provided insights on how the ongoing COVID-19 situation influences Asian unicorns. Unicorn firms have a market value of USD 1B, but this does not make them at all immune to COVID-19. Even before the pandemic, Asian unicorns were already facing profitability issues which could be aggravated by the shock to all levels of society caused by COVID-19.

Investor appetite for unicorns has also decreased due to widespread panic. This will soon result in a scarcity of funding soon requiring unicorns to optimize the capital raised before COVID-19. Venture capital firms expect to be more conservative while investing and will pay closer attention to the unicorns' valuation. A revised valuation may lead to losing the unicorn category. The pandemic has created losers (Fintech) and winners (Healthcare) depending on firms' capacity to capitalize on the opportunities offered by COVID-19.

Future studies could look at how COVID-19 will impact unicorns' geographical collocation, other categories of unicorns in Asia and their births-to-exits ratio. Another direction could be to determine

how COVID-19 will influence the innovation spirit of Asian entrepreneurs. Unicorns have always been born, even in the most hostile crises.

This research looked at unicorn firms in Asia. Thus, the authors suggest studying unicorns from other regions such as Europe or North America to then perform a comparative analysis.

## VALUE – THE “ATOM” OF THE ECONOMY

Philipson, Sarah

University of Gävle, Sweden and Linnaeus University, Sweden.

### ABSTRACT

This is a conceptual paper about the most fundamental concept in the science of business administration, *value*. It traces its history, discusses the demarcation approach of the *service dominant logic*, arguing against it. We hold that *customer co-creation* is already presumed in the concept of use-value; the customer can realize the value-potential of a product or a service by *satisfying experiences* from the offering. Under certain circumstances *relationships* influence the value, often motivating temporal suspension of market relations. In other cases, relationships do not give the potential for additional value and the exchange between seller and buyer continues to be a transaction.

The *micro-foundations of value* are searched in the social psychology of these experiences and how they build the value.

The paper suggests the need for radical re-focusing of business practices.

*Keywords: Value, exchange-value, use-value, co-production, relationship marketing, transaction marketing.*

### INTRODUCTION

Value is the fundamental defining concept of the economy. This paper traces the history of the concept, its psychological micro-foundations, and the implications, requiring radical changes in business practices.

The scientific community of Business Administration is probably the sector of human activity that first embraced the cyclical economy, systematically recycling concepts, by trying to rebrand a phenomenon with new names. In most cases this can be ascribed to ignorance of the origins of the concepts and in some cases it a conscious strategy of attributing an important concept to oneself. In another paper (Philipson, 2019), we have discussed such recurrent rebranding of the phenomenon commonly known as destructive innovation. The same rebranding holds for the concept of value.

## THE HISTORY OF THE CONCEPTS

### *Value, use-value and exchange value*

Ballantyne and Varey (2006) traces use-value to Vargo and Lusch (2004a), also acknowledging Bitner (1992). Sandström, Edvardsson, Kristensson and Magnusson (2008:112) hold that Vargo and Lusch (2004a) introduced a new value perspective, by coining the concept of value-in-use for the customer. They wrote that the value of a service was previously regarded as a ratio between service quality and cost. In the new perspective, value is realized when a service is used. Users of services are thus both the co-creators and the judges of service value (Sandström *et al.*, 2008:114).

Holbrook recognizes the vast legacy of the fundamental concepts: “...*the basic concepts involved could be traced back through the work of (say) Sid Levy at Northwestern in the 1960s, Wroe Alderson at Wharton in the 1950s, and the economists Lawrence Abbott in the 1950s or Alfred Marshall in the early 1900s, all the way to Adam Smith in the Eighteenth Century (e.g., Alderson, 1957; Boyd and Levy, 1963; Woods, 1981).*” “*What these works [Pine & Gilmore, 1999; Schmitt, 1999; Smith & Wheeler, 2002; Shaw & Ivens, 2002; LaSalle & Britton, 2003] share in common – beyond their insistent emphasis on the importance of the consumption experience – is their infallible tendency...[with the partial exception of LaSalle & Britton, 2003]... to repeat the mistake that Beth and I made by forgetting or neglecting to acknowledge the previous thinkers who have pioneered the relevant concepts.*”(Holbrook, 2006:715)

We can add that Vargo and Lusch (2004a, 2004 b) does not even mention Normann (1984) [in Swedish, 1975].

Holbrook (2006) is citing Abbot (195540): “*What people really desire are **not products** but **satisfying experiences**. Experiences are attained through activities. In order that activities may be carried out, physical objects or the services of human beings are usually needed. Here lies the connecting link between man’s inner world and the outer world of economic activity. People want products because they want the **experience-bringing services** which they hope the products will render.*” [italics added by Holbrook].

Bowman and Ambrosini (2000:177) go further back, holding that the distinction between use value and exchange value was made by classical economists (Smith, Ricardo, and Marx). Use-value, or value-in-use, is the reason that a customer buys an offering (a product or service). It is not the offering in itself, but its potential for providing experiences of value-in-use that interests the customer.

Marx “theory chapter” for the research presented in his three volume work *The Capital*, was called *Theories of Surplus-Value*. It is three volumes of together more than 4200 pages, presenting extant research at the time. “*Use values become a reality only by use or consumption...*” (Marx, 1867/2015:27) “*As use values, commodities are, above all, of different qualities, but as exchange values they are merely different quantities, and consequently do not contain an atom of use value.*” (Marx, 1867/2015:28).

### *Differences between products and services*

Three approaches have been proposed for the study of services, the demarcation approach, the assimilation approach, and the synthesis approach (Love and Mansury, 2007; Castro, Montoro-Sanchez and Ortiz-De-Urbina-Criado, 2011).

The *demarcation approach* argues that services are distinctively different from products (Arvanitis, 2008; Hipp and Grupp, 2005), based on the intangible and interactive nature of services and holds that no comparison between manufacturing and services is possible.

The service-dominant logic holds that services are different from products (Vargo and Lusch, 2004a, 2004b). It is an example of the demarcation approach, which holds that the assumption that services have the same characteristics as products is wrong, because services have particularities (Arvanitis, 2008). According to extant literature, services are characterized by the close interaction between production and consumption (co-terminality); intangible content; the important role played by human resources; and the critical role played by organizational factors (Sirilli and Evangelista, 1998; Sundbo and Gallouj, 2000; Sarkar and Carvalho, 2005; Alam, 2006). These distinctive characteristics, and rapid technological and non-technological change, make innovation a of service a complex issue (Camacho and Rodriguez, 2008). Hence, it is important to verify if the manufacturing approach used during decades can be applied to services, or if service innovation is so peculiar that a new approach is needed.

The *assimilation approach* suggests that the features of services are not unique and can also be applied to products (Drejer, 2004).

The *synthesis approach* attempts to cover the missing aspects of both the demarcation and assimilation approaches (Castro, 2011).

Payne, Storbacka and Frow (2008:83), hold that it is central to the service-dominant (S-D) logic that the customer becomes a co-creator of value. We hold that the synthesis approach is valid and that service-dominant logic, with its demarcation approach, is wrong; even for products the firm only produces the *potential* for customers to realize value-in-use: "A quarter of a century ago, however, Alderson (1957) drew a sharp distinction between buying and consuming... **By focusing on the configuration of activities involved in consumption, this viewpoint calls attention to the experiences with a product that one gains by actually consuming it.**" (Holbrook & Hirschman, 1982a:137). [our emphasis] "...all products are services so that the distinction between services marketing and other kinds of marketing disappears." (Holbrook, 2006:715)

The synthesis approach accepts that there are differences between products and services, but hold that these are not systematic. Many services have tangible elements, e.g. the food in a restaurant or the repair of a pair of shoes. Consumption is not always co-terminal with the production of the service, e.g. the value of the shoe-repair is consumed in the continued use of the shoes. Human resources are

often important for the consumption-experience of a product. The sale of a pair of jeans is influenced by the sales-personnel in the retail store. The same or similar experiences can often be given as both products or services, e.g. the streamed film on a television – a service – and the same film on a bought CD, a product..

In the fundamental aspect of how value is produced, the firm's offering, whether a product or a service, only gives the *potential* for satisfying experiences. The customer's experiences of using the product are made during the consumption of the product, which is extended in time, see figure 1.

#### *Co-creation of value*

*"...the user is always involved in the co-creation of value (Prahalad and Ramaswamy, 2000), and that value will not be gained until the customer uses the service (Vargo and Lusch, 2004b)." (Sandström et al., 2008:116)*

*"Central to service-dominant (S-D) logic is the proposition that the customer becomes a co-creator of value." (Payne et al., 2008:83)*

*"...we concur with the view of Woodruff and Flint (2006) that relatively little is known about **how** customers engage in co-creation." (Payne et al., 2008:83). [our highlight]*

## **SATISFYING EXPERIENCES**

Typically, firms have *produced* the offering and left to the customer to *realize the experiences* that the offering can give. The realization of the value that the customer gets out of the offering, is not given by the offering in itself. That it only has the *potential* to give certain experiences, has come to be recognized as the co-creation of value (Prahalad and Ramaswamy, 2004a, 2004b; Payne et al., 2008).

The customer is not buying to buy, but to *use*. But firms historically put all their effort in getting the customer to buy. If they were adhering to a relationship management approach, they might later – directly or indirectly – ask the customer if she was satisfied. They cross their fingers that the customer manages to realize *the potential of the offering*, but they seldom help the customer to enact the use-experience in the ultimate way. *"... traditional consumer research has focused almost exclusively on the choice process that generates purchase decisions culminating in actual buying behavior. Thus, brand purchase is typically viewed as the most important behavioral outcome of the information processing model." (Holbrook and Hirschman, 1982:137). "In exploring the nature of that overall experience, the approach envisioned here departs from the traditional positivist focus on directly observable buying behavior and devotes increased attention to the mental events surrounding the act of consumption." (Holbrook and Hirschman, 1982:37)*

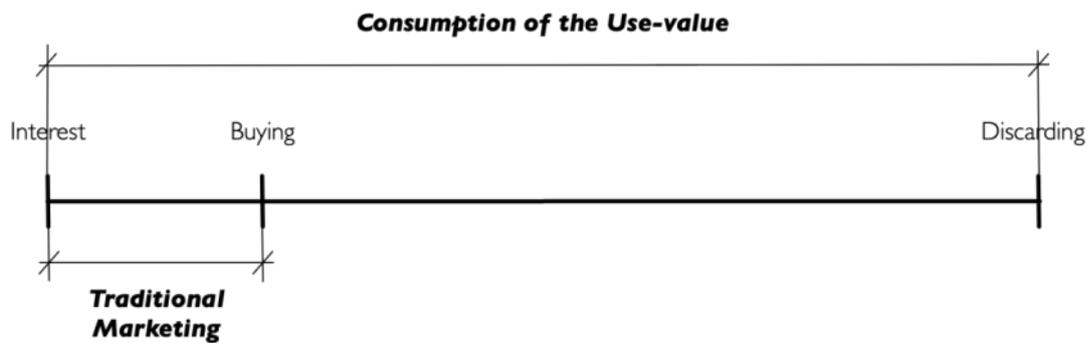

Figure 1. The consumption timeline, own.

The success of the iPhone is to a large extent due to the iTunes store, where customers are helped to realize potentials, in the form of third-party applications, music, or films, which even Apple did not anticipate.

As a consequence, marketing has moved from just influencing the buying process, to recognize that it potentially can influence the value that the customer experiences after she has bought it. This began in services, where production and consumption are often concurrent. To some extent it has also become part of the marketing of products, such as the app stores that increases the value of an already bought smartphone. But for most products, such influence during the consumption timeline is very limited. When does Wrangler address the customers that have already bought its jeans? Except for inducing them to buy another pair?

The experience of the consumption builds expectations of future experiences, influencing whether to buy the same or another product from the same firm, or to look for a competitive offer. For the satisfaction of many needs the customer has accumulated many experiences. However, these do not build knowledge, just *sense*, or tacit knowing. Few offerings are discussed with others, Hence, the perspective of the other does in most cases not enter into the decision process of the consumer. Except for capital goods, such as a car or a refrigerator, for which information is often processed and sometimes discussed, *explicit knowledge* is not part of the considerations. This in contrast to industrial customers, for which several people can be involved in the purchasing decision.

The so-called consumer culture theory (Arnould and Thompson, 2005) holds that consumers chose products as identity markers, to "dress up their identity". This is relevant for a limited range of products, for a limited, and for a limited range of consumers, who would buy clothes or jewellery that is normally not within their budget range. Sometimes such products are bought second hand or by restricting themselves severely for other products. For someone else it could be a motorbike. You cannot readily discern if such seemingly frivolous consumption choices are an exposition of such identity dressing. The choice could be made without bothering about the concerns of others. Of all the values sold in the market, such identity dressing is marginal as a general phenomenon, as 60% of US

consumers earn less than 40.000 USD; hence the room for such spending is very limited. That said it could be extremely important for a specific brand.

## DOES RELATIONSHIP MANAGEMENT CHANGE ANYTHING? – THE DIFFERENCE BETWEEN THE VALUE OF TRANSACTIONS AND RELATIONS

This is a reflection on how value theory can explain the emergence of relations in markets and hence also one reason why there is an inherent drive towards monopolistic competition in capitalism.

### *Transactions*

For a transaction to take place, the buyer has to value the offering ( $v_b$ ) more than the price,  $p$  (including other efforts). Thus, what she has to pay for the offering must have less value than the the potential of positive experiences by consuming the offering,  $v_b > p$ . The seller at the same time has to value the price,  $p$ , he gets for the offering more than the value,  $v_s$ , he might have by keeping the offering, either for his on use or for potentially selling it for a higher price later; hence  $p > v_s$ .

The situation is based on an asymmetric valuation of the value of the product. Hence, in order for the transaction to take place, the value of the product must higher for the buyer than for the seller, or  $v_b - p > 0$  and  $v_s - p < 0$ ; hence  $v_b > v_s$ .

### *Relations*

The 4Ps are presumed to be based on a faulty understanding of the relation to the consumer:

*"...the marketing mix and its Four Ps constitute a production-oriented definition of marketing, and not a market-oriented or customer-oriented one..."* (Grönroos, 1997:324). *If co-operation between seller and buyer give added value, as Grönroos (1997) holds, this added value,  $\partial v$ , is created; at a cost that increases the price (in money and/or costs for both sellers and buyer) with  $\partial p$ . This added value and added costs are shared between the buyer and seller in such a way that the buyer gets a percentage,  $a$ , of the added value and  $b$  of the added costs. The seller gets a percentage of the added revenues,  $1 - a$ , and  $1 - b$  of the added costs. In order for a relationship to be built, a win-win-situation (see game theory) must be created; meaning a situation where  $\partial v > \partial p$ . For the buyer the following has then to be true:  $v_b + f\{\partial v * a\}_b > p + \partial p * b$  and for the seller:  $p + \partial p * (1 - b) > v_s + f\{\partial v * (1 - a)\}_s$ . The buyer has to get  $f\{\partial v * a\}_b > \partial p * b$ , or  $f\{\partial v * a\}_b - \partial p * b > 0$ , and for the seller  $\partial p * (1 - b) - f\{\partial v * (1 - a)\}_s > 0$ .*

By mathematical modelling, it can be shown that a saddle point often can be established for building value by relations between the parties, essentially replacing the market with temporal organized planning, eventually an organized supply-chain. This can be the case when the consumer appreciates the small talk with the shoe-repair man, which becomes part of the

experience, or when the new functionalities of a new computer from the same brand gives innovations motivating loyalty. More often it is the relation between two companies, where the seller gives the buyer values increasing the value proposition of the end customer. This is the situation that Grönroos (1997) presumes is now a generalized reality. But often this is not the case and strict transactional market relations are preferred (Zineldin and Philipson, 2007).

## THE MICRO-FOUNDATIONS OF VALUE: EXPERIENCES BASED ON SENSORY CUES AND EMOTIONS

The customer is not buying to buy, but to *use*. But as discussed above, firms often put all their effort in to get the customer to buy. They might ask if the customer was satisfied. They cross their fingers that the customer manages to realize the potential of the offering, but they seldom help the customer to *enact the use-experience* in the best way.

*How do these experiences develop in the mind of the consumer?*

The higher mental functions are built of the cognitive and emotional dialectics from *action*, to *experience*, and *reflection* over such experiences (Vygotsky, 1962). Human experience is diverse and individual. Hence, the associations are not the same from one individual to another. These experiences are conscious and unconscious. They are accumulated in the human memory. Tacit knowing could be said to be the mass of these associations. Such *accumulation of experiences* does not build knowledge, but *sense*, or *tacit knowing* as suggested by Polanyi (1961, 1962, 1968) or in the form of a "Gestalt", The sense of a word is the aggregate of all psychological facts [Gestalt] that arise in our consciousness, provoked by the word (Wertheimer, Brett, King, Peckler and Schaef, 1992). Polanyi (1962:604) is drawing on Gestalt psychology in his attempt to establish the logic of tacit knowing. *Unconscious tacit knowing* is not accessible for the individual herself. It is not in, what Polanyi (1962) calls, focal awareness. It must be revoked, by means unknown to the individual and it is even more difficult, if not completely impossible, for another person to provoke the making conscious of such knowing (cf. the role of the psychotherapist). Intuition fills the gap left open in the dynamics of tacit knowing (Polanyi, 1962:322).

Sensory cues evoke *mental imagery* based on earlier experience (Holbrook, 1982:112). This imagery is the essence of *tacit knowing*. "...the experiential perspective focuses on cognitive processes that are more subconscious and private in nature. Interest centers on consumption-related flights of fancy involving pictorial imagery (Richardson 1969), fantasies (Klinger 1971), and daydreams (Singer 1966)." (Holbrook and Hirschman, 1982:136).

There is no absolute distinction between conscious and unconscious knowing. As the individual's experience grows and deepens, old experiences retreat to the background and new ones take the

foreground. Neither is there a garbage can at the end of this displacement, other than dementia. Subdued unconscious knowing can come to the foreground again, provoked by new experiences or tacit inferences to old ones. The distinction between explicit, conscious, and unconscious tacit knowing is therefore fuzzy. Knowing emerges through the network of interactions and is distributed and mediated among the interacting humans and their tools (Cole and Wertsch, 1996, cited after Lipponen, 2002:74).

### ***The role of emotions***

*“Using a hedonic consumption perspective, products are viewed not as objective entities but rather as subjective symbols. The researcher is concerned not so much with what the products as with what it represents. Product image, not strict reality, is a central focus; consumer **emotive response**, rather than just semantic learning.”* (Hirschman and Holbrook, 1982:93). [our highlight] The need to work out suitable procedures for investigating the consumer's emotional experiences must therefore be considered a challenging but fascinating task along the road toward a fuller understanding of the experiential aspects of consumption (Holbrook, 1982:116).

Vygotsky believed that affect and intellect are not two mutually exclusive poles, but two inseparable mental functions (Levykh, 2008:85). He emphasized that culturally developed emotions are socially constructed and internalized. They play a key role in shaping motivation and thought (Levykh, 2008:92, 94; Mahn and John-Steiner, 2002:46). The individual emotional experience seems to be foundational (consciously, subconsciously, and unconsciously) to the person's perception, attention, memory, decision-making, behavioral mastery, and overall world orientation (Levykh, 2008:84). Motivation is the mediation between emotions and thought. Motive gives birth to thought, to the formation of thought itself, to its mediation in internal words, to the meanings of external words, and finally to words themselves (Mahn and John-Steiner, 2002:55).

### ***Knowledge***

The development of knowledge is not a purely individual act. If the use-value or value in use is the experience of the satisfaction with the product in use or the service. To learn is not an individual act, not even the individual's learning is done in isolation; it needs “the other”. Knowledge and learning are to a large extent only achieved within a community of practice. (Philipson and Kjellström, 2020:13). As explicit knowledge is harboured in the brain, it is associated with tacit knowing, and hence even explicit knowledge is intrinsically tacit! (Polanyi, 1962),

Knowledge is developed together with others, but not so simplistic as saying that learning involves becoming “...a member of a community of practice through apprenticeship.” (Kolb and Kolb, 2005:200), or as simple as to observe and be part of a practice, as Nonaka (1991:98) seems to believe, but is the result

of the *negotiation of meaning* in a community of practice, by internalizing the experiences of others, *getting a more objective experience*. This negotiated understanding becomes *explicit knowledge*.

When the experiences or the practice in the community is complex, this negotiation of meaning requires *objects as mediators*, as discussed in Philipson and Kjellström (2020). Such knowledge is only what is considered common knowledge, not knowledge in the scientific sense.

#### *Customer choice*

In most cases customer choice is not made on reflected externalized knowledge, but on the sense of satisfaction with the accumulated experiences of offerings from the same company and similar offerings from other companies. These experiences are also *embedded* in the mass of all the individual's experiences. In most cases the decision is not only not made on reflected knowledge, it is not even a conscious process, where these historic experiences are evaluated, but the result of unconscious "intuition". Even in the cases where we consciously reflect whether to buy the offering, it is seldom based on knowledge externalized by interaction with others to find meaning of our knowing.

#### *Industrial buyers' choice*

Investment in machinery and strategic components are often the decision of project teams, in which they externalize their individual tacit knowing (Philipson and Kjellström, 2020). For less strategic components, heuristics are often used for decision-making (Busenitz and Barney, 1997). Such heuristics can be the result of historical organizational learning processes or the intuitional biases of the individual taking the decision. Hence, we hold that there is no qualitative difference between how consumers and industrial buyers make choices. However, the share of decision-making based on rational externalized knowledge is higher in the choice of industrial buyers.

## CONCLUSIONS

- Value is the most fundamental concept in the science of business administration.
- The firm produces an offering, a product or a service. In exchange for this offering, the firm realize an exchange value.
- The offering gives the customer the potential to realize use-value from the offering. This use-value is realized by satisfactory experiences of consuming the offering.
- Sensory cues and emotions at the moment build these experiences.
- Accumulated experiences build tacit knowing, the sense of things and phenomena.
- Knowing is externalized in social processes. These social processes are within one of the many communities of practice, of which we are members.

- Negotiating meaning in those communities of practice makes it possible to build common, or externalized, but not scientific knowledge.
- Our consumption experiences are the sum of the instances of experiences of consumption, extended during shorter or longer time.
- Our decisions to buy an offering are the result of our conscious and unconscious making of those decisions, based on previous experiences and sometimes, but often not, of the reflection on those experiences together with others.

## IMPLICATIONS

Value is the concept that is the foundation of economy, occupying much the same “space” in the understanding of the economy as the atom in chemistry. It is fundamental to understand this concept and its psychological micro-foundations to understand why and how the customer, whether a consumer or an industrial customer, is satisfied during and after the consumption of the product or service. Marketing, innovation, engineering, and production has almost exclusively been occupied with producing or creating the offering, while seldom reflecting on whether the customer can realize the value potentials of it. Such a re-focusing will necessitate radical change in business practices.

## STRATEGIES TO SURPASS THE LACK OF TOUCH CONSTRAINT ON E-COMMERCE OVERSEAS

**Piloto, Rita; Meneses, Raquel**

School of Economics and Management, FEP, Oporto, Portugal.

### ABSTRACT

Internet came to help firms enjoy crucial business opportunities, by reducing international barriers associated to internationalization processes. With the trivialization of cross-border e-commerce, consumers can not only buy online but also buy from different foreign markets. However, with this type of selling platform, they will need a higher mental effort to better understand online presented goods due to linguistic and cultural differences, and, even more importantly, the intangibility associated to it. When it comes to products that usually require physical contact to be better perceived it gets even more complicated. That is what happens with experience goods. So, firms must choose wisely how to present these goods in order to gain consumer's trust. Therefore, this work is a literature review work which has the purpose of investigating how to overcome this e-commerce constraint, by collecting and analyzing several points of view of different authors and then understand how these findings should be adapted in an international environment. It was already found in the literature some few strategies that help dealing with consumers' trust issues, such as: clear and fair policy, brand reputation, online sales promotion, written descriptions, multimedia materials, advertisement, good design of the webpage, virtual world, communication, consumer review and feedback, online forms, product trial and unique products. These strategies might, in its own way, help to respond to this constraint, with some external market adaptability.

### INTRODUCTION

This work has the purpose of investigating how to overcome the lack of touch constraint inherent to cross-border e-commerce on selling experience goods, alongside with a context of insecurity derived by cultural distance between countries and liability of outsidership. Having this in mind, it seems important to have a more global perception of the inherent problems associated to e-commerce transactions within different markets, in a time that physical contact is being limited. Within this pandemic situation and as an inherent problem of cross-border e-commerce, this lack of touch

constraint may constitute a barrier to sales for companies. For such purpose, some strategies already found in the literature that companies can adopt in order to surpass this actual constraint in the online international environment will be presented.

Nowadays it is known that the Internet has a crucial role in society's dynamics and the number of internet users is growing day by day. People spend so much time connecting to the internet world using websites and social media (Angioni, 2019). In fact, it appears to be useful for the business world, where web channels were transformed to opportunities for global e-commerce (Lawrence and Tar, 2010), creating the cross-border e-commerce. These channels are of high importance in what concerns competitiveness and growth (Angioni, 2019) mostly due to its efficiency and practicality (Lawrence and Tar, 2010). When it comes to a purchase between different countries, there are costs that strongly affect buyers and sellers trust, which will interfere with transactions. As it is highlighted by Valarezo et al. (2018), several authors mention the main barriers for cross-border e-commerce to be little familiarity and trust in the seller, language, need of payment security, costs arising from different currency and cost efficiency of parcel delivery. Compared to two decades ago, today companies have easy access to several digital communication tools that allow them to develop relationships with potential customers all over the world, regardless of company's and customers' location (Angioni, 2019). However, e-commerce also presents limitations, and it is not adequate for all kind of business. In several sectors and, thereby, some products, consumers need to experience goods before they decide to buy them. These are called experience goods, the type of purchase that relies on a direct product experience, where consumers need to feel the product with their senses to understand its attributes (Klein, 1998). The need of touch to analyze the good is the common attribute of these goods. Thus, this kind of products need careful attention when it comes to online sales for foreign markets and this process can become difficult to happen. Therefore, this lack of touch appears as an e-commerce substantial disadvantage (Niranjanamurthy, et al., 2013).

## LITERATURE REVIEW

Companies are getting more internationalized with each passing day in which focusing only on home markets is no longer an option. The internationalization process of a firm occurs when it "increases its commitment and involvement to international markets, on all aspects of its productive activities" (Etemad et al., 2010, p. 320). Also consumers can shop through two types of environments: remote and in-store environments. According to McCabe and Nowlis (2003), on remote environments rely their purchase decision merely on the information provided through the sense of vision. On the other hand, in-store environments are the ones where consumers can touch products and, thereby, use their sense of touch to evaluate their purchase decision. Indeed, throughout the years, the human senses have

progressively been recognized as crucial factors that truly influence consumer's behavior, emotions and perceptions (Rupini and Nandagopal, 2015). That is why analyzing the sense of touch in the purchase intention process is of great importance. Also, e-commerce, as a remote environment, has changed the way of doing business and internet use is considered almost a primary need on these days. The Internet has been seen as an important driver for firms seeking to expand their business overseas (Mostafa et al., 2005). Although it is witnessed a rapid increase in electronic commerce over the last decades, consumers see the Internet as an unsafe purchasing environment compared to in-store methods (Eggert, 2006).

#### *Internetization*

At the beginning of the internationalization process, firms lack precious knowledge about the market they want to enter and face cultural obstacles (Singh et al., 2005). As stated by Loane (2005), some companies need face-to-face interaction with their clients according to the type of product and the sum significance involved in the transaction. Firms face liability of foreignness, which increases when psychic distance increase (Johanson and Vahlne, 2009), which increases the uncertainty and costs of coordination that influence the market choice decision (Singh et al., 2005). Besides, markets cannot be only seen as territories, they are also "networks of relationships in which firms are linked to each other in various, complex and, (...) invisible patterns" (Johanson and Vahlne, 2009, p.1411). Hence, it is crucial for entering firms to be present in relevant networks (Johanson and Vahlne, 2009). When companies face difficulties because they do not have any position in relevant business networks, they are facing liability of outsidership (Johanson and Vahlne, 2009). Internet has a redefining role in facing liability of outsidership. It redefined the current way of doing business in a way that today it is not only affordable to access the Web, but also essential to maintain business activities (Loane, 2005). This internetization concept emerged with the development of internet-based information that enabled the involvement of influential agents crucial to transmit information that capture the initial base for the firm's value creation (Etemad et al., 2010). It has a crucial role in the current state of information intensity and as a communication source (Mostafa et al., 2005). Today, firms can easily and quickly access to knowledge referent to new markets, industry trends or even supplier details (Loane, 2005). Also, the rise of online trade contributes to the decrease of the relevance of geographical distance in what concerns the supply of information (Huang and Chang, 2019). Apart from that, the Internet allows firms to interact with important stakeholders regardless of geographic area which may lower the need for face-to-face interactions (Mostafa et al., 2005). Basically, the Internet can be seen as an "all-embracing global network" (Petersen et al., 2002, p. 208). Accessing to the Web provides firms with several benefits such as reduced importance of economies of scale, lower marketing communication costs, price standardization and reduced time to get quality information (Loane, 2005).

Even though there are no real border barriers to face, the entry into the internetized world may be difficult at the beginning, just like in the real world (Etemad et al., 2010). Angioni (2019) even states that the internet-enabled opportunities will trigger even more internetization which may have become a necessary condition for internationalization of firms (Etemad et al., 2010, p. 339) and Internet may hold the potential of accelerating foreign market expansion (Petersen et al. 2002), providing a new form of international trade, the cross-border e-commerce.

#### *Cross-border e-commerce*

Cross-border e-commerce consists in a new type of international business activity, allowing consumers to buy online from merchants, located in other countries and jurisdictions (CBEC, 2019). Products need to be physically transported between different regulatory systems (Gomez-Herrera et al., 2014), allowing paperless transactions and lowering transaction costs (Hu and Luo, 2018). In traditional foreign trade, commodities must go through several national agents to reach overseas importers, but now with this type of international trade, foreign consumers can directly receive the same domestic commodities (Hu and Luo, 2018) as well as dealing with a different kind of distance. Distance is considered a “proxy for various sources of international trade costs that affect the relative price of domestic and imported goods” (Gomez-Herrera et al., 2014, p. 84) and its effects will vary by product category (Martens, 2013). Factors like trust and value will have a crucial role in determining consumers’ online shopping behavior (Huang and Chang, 2019). Consumers will choose to buy from vendors who offer maximal value, whether they are domestic or foreign vendors (Huang and Chang, 2019). Besides, firms are constantly making efforts to optimize their value creation process in order to match the buyer’s value expectation (Etemad et al., 2010). In fact, when the total purchase cost presented by the foreign website is lower and the availability of the wanted product in the home-country is limited, consumers will prefer to shop on a foreign website (Huang and Chang, 2019). Some authors have found benefits from online purchases, whereas other have found costs and risks throughout the literature. Martens (2013) highlights increased price competition both in online and offline markets, increased variety of supply and the reduction in consumer transaction costs. Huang and Chang (2019) states that price competitiveness and product uniqueness are also perceived benefits. In Gomez-Herrera et al. (2014) study, distance-related trade costs were significantly lowered compared to offline trade, because of information costs’ reduction. Factors like the legal structure and national integrity of a vendor’s country will have influence in consumers’ trust perceptions (Huang and Chang, 2019).

However, consumers still perceive some costs when choosing to purchase online. According to Niranjnamurthy et al. (2013) there is no clear guarantee of the product’s quality and delivery, a proper access to a mobile device is required, time and monetary costs associated to every purchase may be harmful, consumer’s privacy attacks may happen and its resolution is struggled by jurisdictional

aspects, among others. Martens (2013) described the culture-related trade costs, the ones that emerge from linguistic and cultural barriers. Huang and Chang (2019) also suggest three types of costs: communication, waiting and return costs. In the online shopping process, consumers must read and interact with foreign vendors sometimes in an unfamiliar language, decreasing the perceived value and, therefore, the likelihood of purchase (Huang and Chang, 2019). Besides, because of geographical distance, cross-border delivery times are usually longer and the returning process more costly to the customer (Huang and Chang, 2019). In the same way, Gomez-Herrera et al. (2014) confirmed that cross-border e-commerce is still affected by trade costs, because of linguistic market segmentation costs and online payments security concerns. Finally, Singh et al. (2005) explain the importance of host countries' regulatory system. At last, in what concerns e-commerce companies, they face a faster internationalization process compared to traditional firms due to some characteristics. They can share information and knowledge in real-time with both customers and other business units crucial for decision-making process and more efficient flow of products (Singh et al., 2005).

Regarding firm-specific traits, e-commerce firms are usually endowed with innovative capability, marketing capability and previous international experience in the management teams. Thereby, firms are more likely to seize business opportunities, reduce uncertainty and enjoy network connectivity when entering foreign markets. When it comes to foreign countries' technological infrastructure, it is important for a firm to succeed to analyze the market's internetability (actual usage of internet), the technology supportiveness, legal protection and regulatory transparency. With the trivialization of cross-border e-commerce, distance-related trade costs were significantly reduced because information costs and trust frictions were reduced. However, geographical and psychic distances still play an important role in customers' decision processes (Huang and Chang, 2019). All in all, e-commerce companies face lower coordination and communication costs, which explains the faster internationalization process of these firms. On online platforms, buyers will be presented with a variety of foreign goods but they will need more mental effort to understand such goods (Zhu et al., 2019).

#### *Experience goods and need for touch*

In order to evaluate a product and understand if it is intended to be bought, buyers need to spend time searching for information, regardless of the type of product, that can be done through online websites or by in-store environments. Human senses are the ones responsible for this evaluation (Rupini and Nandagopal, 2015). Indeed, most of our purchase decisions are based on emotions, feelings, recalling situations, memories (Bratulescu and Vasilache, 2014), rather than on rationality. Therefore, sensorial experiences in the buying process emerge from the stimulus of our senses that can generate emotions which means that a purchase becomes more than a simple buying process (Schmitt, 1999). Companies should not only consider the consumer's reasoning but also the emotion generated in which the buying

decision will rely on (Schmitt, 1999). That is why it is so important to consider the sense of touch. Besides, the information obtained must be credible for shoppers, in order to give them security when making the purchase decision (Rodrigues and Silva, 2013). When searching on websites, shoppers will be presented with product descriptions, yet some of them need to touch a product to acquire information about it (Peck and Childers, 2003a). These customers need haptic information to analyze objects that is obtained through the sense of touch or transmitted by others by another communication tool (Rodrigues and Silva, 2013), in other words, it is the information retrieved by experiencing the object with our hands.

The need for haptic information to make the purchase decision will vary from consumer to consumer (Peck and Childers, 2003a) because it helps to appreciate the product's quality (González-Benito et al., 2015). This need for touch is defined as a "preference for the extraction and utilization of information obtained through the haptic system" (Peck and Childers, 2003a, p. 431) and it varies from consumer to consumer. So, this need for tactile input gains importance when determining which shopping medium should be used (Citrin et al., 2003). Basically, when consumers require sensory, physical or experimental information about a product, they usually prefer to purchase it through a physical store (Flavián et al., 2017). At the same time, there are products that really require previous experience before being purchased and these are called experience goods (Klein, 1998). Therefore, it is expected that these goods are less prone to be bought through online channels (Rodrigues and Silva, 2013). Besides, as web markets enable immediate access to useful information about products' experience attributes and their prices, consumers can evaluate different experience goods (Peck and Childers, 2003a) and the purchase decision is facilitated (Laroche et al., 2005). However, when facing barriers to touch that inhibit access to haptic information, their confidence will decrease and, consequently, become discouraged to buy online (Peck and Childers, 2003a). Also, when it is impossible to touch, it gets hard for consumers to discriminate among products (San-Martín et al., 2017) and between varying levels of product quality (Grohmann et al., 2007). Customers will construct a less positive evaluation of products since they have less available information (Grohmann et al., 2007). Thus, since buying online does not provide the same product insight when compared to remote environments (Peck and Childers, 2003a), it seems legitimate that the need for touch limits online shopping intentions (Rodrigues and Silva, 2013).

However, there are authors that have other perspectives regarding importance of the sense of touch in the shopping process. González-Benito et al. (2015) conclude that depending on the prominence of tangible attributes in goods, the need for touch may not be essential to its evaluation by customers, yet it can be important when choosing between a set of options available to buy. Also, Yazdanparast and Spears (2013) state that the frustration felt by customers with a high need for touch can be surpassed by a positive mood. Eggert (2006) concludes that factors like consumer's concerns related to its privacy

and security are what highly influence its perception of risk in online shopping, whereas intangibility gains major importance when using traditional methods of shopping. Indeed, e-commerce presents retailing challenges because of its intangible nature which can cause consumers to be uncertain about whether products purchased online will fit their needs (Weathers et al., 2007) and, therefore, complicates the pre-purchase evaluation of goods (Laroche et al., 2005). For that matter, the need for touch might be seen as a constraint to online shopping and, therefore, a business constraint for companies that rely on online channels to profit. Consumers can dislocate themselves and opt to experiment in physical stores to surpass these online restrictions. However, that is not the only concern. Despite the possibility of ordering the product and touching it when it arrives home, buying from foreign markets brings other problems. It must also be taken into consideration the geographic distance, regulatory barriers, linguistic differences and physical delivery costs on the shoppers' decision. After all, in this research, e-commerce intangibility constraint gains even more importance by being associated to an international trade dynamic, which brings more difficulty. Thereby, it is crucial to understand what ways are available to surpass this constraint in the literature.

#### *Ways to surpass*

Some ideas have been discussed in studies about how to overcome this constraint. As stated before, experience goods require a greater depth of search and this search can be enriched by online mechanisms used by vendors to allow consumers to interact with product attributes before purchase (Huang et al., 2009). In physical stores, buyers may opt to try a product when the sense of touch is required to evaluate it, and then, they may opt to buy it online through an online channel. Nonetheless, when it comes to shopping from a foreign company, consumers cannot experiment a good in a physical store, so opting for trying in person first is not an option evaluating solely from an online platform. Likewise, consumers have to get involved in the platform so as to gain trust which is a key factor that determines consumers' online shopping behavior (Huang and Chang, 2019). Although they face uncertainties when buying online, these can be reduced through perceived trust (Zhu et al., 2019) that will develop a higher likelihood of buying (Baker et al., 2019).

All customers want to feel safe when opting for this shopping method and for that reason companies should provide a clear and fair policy in what concerns payment methods (Lian and Yen, 2013) as well as information security (Eggert, 2006). Besides, it has been noticed by Mou et al. (2018) and Dholakia and Zhao (2010) that shipping time has a great impact on consumers' satisfaction, therefore firms should bet on global logistics too (Huang and Chang, 2019). Huang and Chang (2019) also suggest it might be appropriate to consider collaboration with service providers to deal with international payments, deliveries, duties and laws regarding foreign customers. In what concerns the national

integrity of the foreign vendor's country, companies should provide guarantees or consider selling through national agents (Huang and Chang, 2019). Consumers evaluate a good's quality using not only intrinsic cues, but also sing extrinsic cues such as the brand name, reputation, price and quality of the vendor associated to the product (Citrin et al., 2003). The brand represents the signals the firm wants to send to the market about its quality and it gets even more important when physical access is not an option (González-Benito et al., 2015). A strong brand will hence be associated with higher levels of quality, which will provide better assessments by buyers (González-Benito et al., 2015). Customers are getting even more visually sophisticated and are selecting in a more conscious way (influence of the senses), therefore brand strategy built carefully seems a valid way to diminish perceived risk and to communicate trustworthiness (Eggert, 2006). In a remote environment, due to its intangibility, brand planning plays a greater role in the brand's strategy.

Another strategy that can enhance the likelihood of purchasing in this environment is online sales promotions in accordance with Yazdanparast and Spears (2013), Lian and Yen (2013), Huang and Chang (2019) and San-Martín et al. (2017). When it comes to buying expensive products online, the purchase decision must be taken more carefully, since it is a great investment to be made. If there is the possibility to buy with a price discount, some customers may feel more prone to experiment it, since there is a significant perceived risk reduction.

During the shopping process, customers need to spend some time looking and searching for products. It is not different when using online platforms, the more time customers spend searching through the platform and learn how to use it, the more likelihood of purchasing (Zhu et al., 2019). Hence, the decision about how to present the information about products' characteristics and the interaction with the consumer should be revised. To begin with, a product should be described with written information and should include pictures so as consumers can visualize it. When presented with written descriptions describing the product's haptic information, consumers' confidence in product evaluation increase (Peck and Childers, 2003b). In the same way, Zhu et al. (2019) found on their study that a high-quality product description highly influences perceived trust from buyers, by reducing foreignness uncertainty and hence lessen their perceived risk. Rodrigues and Silva (2013) also found that hands-on descriptions next to the product image might enhance companies' sales. Actually, emotional information about the good should be presented firstly followed by the core technical information (Yazdanparast and Spears, 2013), always with clarity (Dholakia and Zhao, 2010). High quality product descriptions contribute to a better consumer perception of the product (Rodrigues and Silva, 2013), enhance trust beliefs towards product providers (Zhu et al., 2019) and further alleviate foreign customers' uncertainty about products and reduce their perceived risk (Zhu et al., 2019).

Notwithstanding the importance of the construction of clear and easy to understand information, sellers should find ways to stimulate shoppers' attention by presenting pictures or videos (Zhu et al., 2019). Pictures were found to reduce performance uncertainty and improve the vividness of information for experience goods (Weathers et al., 2007). Flavián et al. (2017) conclude that when presented with an appealing video, consumers would produce better attitudes toward the product whereas with realistic video, consumers' likelihood of purchasing increased. This is explained by the ease of imagining the product. Moreover, videos can be used to help consumers learn how to buy using online technologies or to teach about product usage (San-Martín et al., 2017; Lian and Yen, 2013). This multimedia materials help to establish a positive image toward buying goods online (Lian and Yen, 2013). It might be advantageous, for firms, as well, to allow product trial before purchase. Offering free product tests can make the experience to be perceived as easier and less risky (San-Martín et al., 2017), and sending fabric swatches might even allow a better quality perception, namely for experience goods (Weathers et al., 2007). Citrin et al. (2003), Lian and Yen (2013) and Laroche et al. (2005) defend offering free trials too. Advertisement is also crucial to diminish perceived risk (Eggert, 2006), so companies should emphasize the experience of the good in order to promote positive feelings in consumers (Yazdanparast and Spears, 2013).

Furthermore, communicate trustworthiness should occur already on the shopper's first interaction with the website (Eggert, 2006), thereby a good design and clear interface may increase consumers' online experience (Dabrynin & Zhang, 2019). The webpage should be detailed and easy to understand (Lian and Yen, 2013), presenting clear information and it must be easy to find what consumers are looking for (Dholakia and Zhao, 2010). Thus, companies should invest in feature-rich websites (Huang et al., 2009) to make the process more appealing. For instance, the use of virtual word as a way to enhance trust during the buying process is gaining popularity, where customers can interact online by experiencing social presence (Baker et al., 2019). However, firms should only invest in this kind of resources if their consumers have familiarity with mixed reality e-commerce (Baker et al., 2019). Besides, communication between shoppers and sellers is fundamental to enhance consumers' involvement (Zhu et al., 2019). Companies should talk to customers, listen to them and provide them with reviews from other consumers' experiences. By establishing online real-time customer services with conversational agents through instant messaging applications and free calls (Lian and Yen, 2013), sellers can communicate with consumers and teach them how to look for and purchase products on the platform (Zhu et al., 2019). Concerning linguistical costs and in order to diminish them, firms should provide multi-language websites and consumer services (Huang and Chang, 2019).

Firms need to listen to customers feedback as well, so that they can increase customer retention rates, increase consumer perception of quality and a positive company image, and therefore build a stronger consumer relationship (Mou et al., 2018). It also allows firms to understand difficulties and barriers for users (Mou et al., 2018) and contribute to a much more accurate product evaluation (Huang et al., 2009). In fact, companies should not only listen to consumers opinions, but should also provide them with the means to access to other buyers' reviews. These third-party evaluations may reduce uncertainty and increase information credibility and must provide negative and positive information (Weathers et al., 2007). At last, providing unique products for foreign buyers that are hard to find in their home country may be a good strategy for cross-border firms as well (Huang and Chang, 2019).

## **IMPLICATIONS**

This study has the major purpose of revising what has already been discussed in the literature about a current constraint of cross-border e-commerce, the lack of touch inherent to these sales. Even though it is not easy, some strategies might be used by companies to promote these online sales within different markets. These presented strategies confirm the importance of promoting trust and security senses in consumers, not to mention the importance of ensuring proximity and confidence on the company, whereby companies should focus their efforts on this kind of measures. By the same token, this study shows some of the problems that companies face from international nature and alert managers of the necessity of rethinking their sales strategies in an online overseas environment with measures related with the promotion of trust: in the product they are selling, in the process of the sell and in the company. More recently, as the world is facing a global pandemic, this characteristic of touch seemed to have gained importance in such times that physical touch is being limited and consumers do not feel comfortable to leave their houses.

## **CONCLUSION**

With the trivialization of cross-border e-commerce, consumers can not only buy online but can also buy from different foreign markets. With this way of doing business, there are still cultural and linguistic costs associated, monetary and time costs and uncertainty regarding guarantees of quality and delivery. Besides, consumers will need a higher mental effort to better understand online presented goods due to linguistic and cultural differences and, more importantly, the intangibility associated to this buying method. Customers will have to evaluate the experience good by only analyzing the information provided on the store's website, that usually require physical contact to be better perceived. This requirement will influence the shopping medium chosen and, therefore, buying online

might be seen as inappropriate for some consumers, since digital platforms usually bring up insecurity and uncertainty to them. So, firms must choose wisely how to adapt their online business to their international activity to build consumer's trust. Some strategies have already been found in the literature, so far, each one being appropriate in its own way to respond to the constraint and with adaptations regarding each market specificities. Ideas such as using a clear and fair policy, betting on brand reputation, online sales promotion, advertisement, virtual world, good design of the webpages, good quality multimedia materials and written descriptions might help dealing with consumer's insecurity. Providing product trials, unique products, and listening and communicating with consumers (online forums, feedbacks, conversations) are prone to help surpassing this constraint, as well.

# RELATIONSHIP BETWEEN IN-STORE MARKETING AND CONSUMER BEHAVIOUR IN TELECOMMUNICATIONS INDUSTRY AND FMCG RETAILING

Pirić, Valentina<sup>1</sup>; Kurtović, Ante<sup>2</sup>; Martinović, Maja<sup>1</sup>

<sup>1</sup>Dept. of Marketing and Tourism, Zagreb School of Economics and Management, ZSEM, Zagreb, Croatia

<sup>2</sup>Brand Sector, Hrvatski Telekom, HT, Zagreb, Croatia

## ABSTRACT

Although the importance of digital channels is emphasized, in-store marketing tools serve as the final step before purchase. Hrvatski Telekom (HT), a market leader in the telecommunications industry and Drogerie markt (dm), a market leader in the FMCG retail industry in Croatia invest a lot into in-store marketing. The purpose of this study was to provide an insight of relationship between in-store marketing and consumer behavior with objectives to explore and underline the importance of in-store marketing in digital world and it's possible influence on consumer buying behavior. A primary research with a study was carried out in Croatia during 2018 on the basis of 200 HT and 300 dm customers. The qualitative research result confirm that in-store materials have a strong influence on customer's perception and behavior. Research findings show that more customers are prone to rather engage with multimedia contents than print. Although it was not proven that higher percentage of sales was made by customers who asked for more info about the offer they engaged with, multimedia contents contribute in creation of additional revenues. It is proven that customers' satisfaction with in-store promoters creates a stronger desire for purchasing and that the level of engagement is higher for customers whose reason of visit is positive, which represents additional contribution of the study.

## INTRODUCTION

The purpose of this study was to provide an insight of relationship between in-store marketing and consumer behavior with objectives to explore and underline the importance of in-store marketing in digital world and it's possible influence on consumer buying behavior. As the birth of mall culture took place in 1950's, in-store marketing becomes the new branch of marketing with high influence on customers (Braun, 2015). In the next decade, advertising and direct mail were the most used marketing

channels (Adams, 2013). In the 1970's, UK companies investing the most in advertising were manufacturers, while today retailers advertise the most (Sullivan et al. 2002). An increase in the level of investments into POS activities can be noticed in the 1980's (Quelch, 2007). Huge amount of marketing expenditures is allocated today to trade promotion activities. Although online channels and online sales rapidly grow, traditional retailing will always retain its primary function. Therefore, retail marketing will remain one of the most important channels for direct communication and creating awareness.

## **IN STORE-MARKETING OVERVIEW AT HRVATSKI TELEKOM (HT) AND DROGERIE MARKT (DM)**

The implementation of retail marketing is especially important in industries such as telecommunications and FMCG retailing. The level of customer's product involvement is high, customers make rational decisions by evaluating criteria such as pricing, features, additional benefits, etc. Customers are less loyal. Usually, the price is not dictating the level of product's quality. Customers are insecure what to buy and the selling concept of marketing plays an important role.

HT, a part of Deutsche Telekom AG is the Croatian market leader in telecommunications industry. It operates since 1999 and has 46 T-Centers within whole of Croatia. Companies in the telecommunications industry invest a lot into in-store marketing. As telecommunication companies are cooperating with mobile phone vendors, they need to provide visibility to them by enabling special corners and positioning with other POS materials. T-Centers are differentiated by the type of concept. The newest concept of T-Centers is called 2020. Those T-Centers are multimedia-oriented. Another type of in-store advertising is window graphics. Big vendors in promotional activities at the different POS. Their core tasks are to welcome customers, ask for their purpose of coming to the store, advise them and assist them while paying the bills. The purpose of POS is not just to sell the goods; it serves as marketing potential where companies create the customer experience, build the image of a brand, and finally drive the sales (Perrey et al. 2012).

Dm, a number one retailer of FMCG, operates in Croatian market with 157 stores. Retailers such as dm should invest in in-store marketing to create awareness. The only implemented type of print content are newsletters with special offers. Multimedia is not implemented. Dm focuses on in-store materials that are positioned next to the products. Mostly used in-store material is shelf wobblers. For specific product categories, dm implements a differentiation of price tags.

## **OBJECTIVES OF THE STUDY**

The goal of this research paper was to determine to what extent does in-store marketing implemented at HT and dm have an impact on consumer's behaviour and perception and to understand importance

of POS materials when consumers need to make decisions. Although the increase in online sales is evident, many consumers choose to purchase at standard POS. One of the research objectives was to analyze engagement of HT customers with all in-store marketing activities, and to understand the impact of it on their behavior. Research paper tends to provide answers to questions about in-store marketing at HT, such as: Do customers, while waiting, like to engage with different types of in-store materials? Does multimedia content influence the customer's decision making? Do standard POS materials such as wobblers help in raising awareness of specific mobile device? How does in-store personal selling affect customer's decision making? Is customer's reason of the visit related to in-store behavior? Does positive sales representative attitude have a positive effect on customers? Regarding FMCG retailing, investments in trade marketing are not as high as in the telecommunications industry. Research paper tempts to provide answers to questions about in-store marketing at dm, such as: Does price tag differentiation enable eye-catching effect on price sensitive customers? Do shelf wobblers enable eye-catching effect on customers? What is the correlation between price of a product and promotion which is communicated through wobblers? How successful is the personal selling that occurs at cash register? The final object of research was to compare the industries and make conclusions accordingly.

## **METHODOLOGY AND RESEARCH FINDINGS**

In the Republic of Croatia, there is no research that analyzes the relationship between in-store marketing and customer behavior in the telecommunications industry and retailing industry selling FMCG products. Besides secondary research, primary research was conducted through field research on a sample of 200 HT consumers (N= 200) and 300 dm customers, (N=300). Primary research could be considered as a quality foundation in making further marketing decisions for the POS of selected industries. The study was carried out in Zagreb, Croatian capital, in the period September – October 2018. Primary research instruments were face-to-face interviews and observation analysis. Research method was qualitative including in-store interviews and store exit interviews. Additionally, online surveys were conducted to analyze the perception of respondents on brand image. The following hypotheses were formulated in order to articulate the objectives of the research:

- (H1): Level of engagement with in-store materials at HT is higher for consumers whose reason for visit has positive purpose
- (H2): Multimedia contents at HT POS are the main sales driver
- (H3): Customers who rate in-store promoter's presentation skills as 'excellent' are more likely to purchase a mobile device
- (H4): Friendly attitude of HT sales representatives is correlated with high level

of customer satisfaction

(H5): dm price sensitive customers better recognize and react to price tag differentiation

(H6): Implementation of shelf wobblers at dm POS proves to be more efficient for promotions which include a monetary benefit

Demographic structure of sample size by gender, age and education level are shown in Table1, Table 2 and Table 3.

| Gender | HT sample size           | dm sample size           |
|--------|--------------------------|--------------------------|
| Male   | 47.50% (95 respondents)  | 35.00% (105 respondents) |
| Female | 52.50% (105 respondents) | 65.00% (195 respondents) |

Table 1: Demographic structure of sample size by gender

| Age group | HT sample size          | dm sample size          |
|-----------|-------------------------|-------------------------|
| 20-29     | 25.50% (51 respondents) | 22.67% (68 respondents) |
| 30-39     | 33.00% (66 respondents) | 31.67% (95 respondents) |
| 40-49     | 22.50% (45 respondents) | 21.00% (63 respondents) |
| 50-59     | 11.50% (23 respondents) | 16.33% (49 respondents) |
| 60+       | 7.50% (15 respondents)  | 8.33% (25 respondents)  |

Table 2: Table 3: Demographic structure of sample sizes by age

| Education     | HT sample size          | dm sample size           |
|---------------|-------------------------|--------------------------|
| Elementary s. | 6.00% (12 respondents)  | 2.00% (6 respondents)    |
| High school   | 27.50% (55 respondents) | 37.00% (111 respondents) |
| Bachelor      | 29.00% (58 respondents) | 25.33% (76 respondents)  |
| Master        | 36.50% (73 respondents) | 32.67% (98 respondents)  |
| Doctorate     | 1.00% (2 respondents)   | 3.00% (9 respondents)    |

Table 3: Demographic structure of sample sizes by education level

## POINT OF SALE OVERVIEW AT HRVATSKI TELEKOM (HT)

In order to understand the impact of different types of POS materials, in-store customer behavior have been observed. In T-Centers, all-together 60 customers interacted with the print content, while 140 customers interacted with the multimedia. Digital contents prove to be more effective. Customers in the age group 50-59 are the group most interested in in-store contents; and 78.26% of them engaged with multimedia. All-together, 40% of customers who interacted with multimedia content asked for additional info about it. Additionally, HT produces co-branded wobblers. All-together 68% of 200 observed customers noticed the wobbler. Personal selling proves to be efficient in creating desire. Out

of 200 customers, 110 of them were able to meet the promoter of one vendor. Results show that 93 customers reacted positively to the promoter's proactive approach. All-together, 49 out of 110 customers rated promoter's presentation skills as 'excellent'. The level of engagement is highly correlated with the customer's reason of visit. The customer's reason of visit does relate to the level of interactivity during waiting time. Companies should also observe sales representative behavior. Out of 71 customers whose reason of visit was negative, 40 of them (56.34%) changed their behavior positively after talking to a sales representative.

## **POINT OF SALE OVERVIEW AT DROGERIE MARKT (DM)**

At dm POS, price tag differentiation is implemented for perfumes. Out of 300 customers, 235 of them browsed the shelf with perfumes. Interestingly, 17% of customers immediately approached to perfumes with red price tags. Most used in-store marketing material at dm of sale is shelf wobblers. All-together 51% of customers started browsing personal care products, paying special attention to shelf wobblers. In total, 29% of customers immediately approached to product with shelf wobblers. At dm point of sale, the level of customer's product involvement is smaller than at HT point of sale. Research results have proven, as stated earlier by Braun during 2015, that in-store marketing becomes the new branch of marketing with high level of possible influence on customers and their behaviour.

## **HYPOTHESIS VALIDATION OVERVIEW**

Veracity of hypotheses H1 to H5 have been examined by using a hypothesis testing of the difference between two samples. A two sample z-test has been used to determine whether the two sample means are equal or unequal. For hypothesis H6, a t-test (paired two sample for means) have been used. Confidence level is 95%, and therefore alpha value ( $\alpha$ ), the probability of making a Type I error, is 5% (0.05).

H1: Validation

- Null hypothesis (Ho):  $\mu_1 - \mu_2 \leq 0$ ; Alternative hypothesis (Ha):  $\mu_1 - \mu_2 > 0$
- Variable 1: customers whose reason of visit has positive purpose; Variable 2: customers whose reason of visit has negative purpose
- $n_1 = 129$ ,  $n_2 = 71$

All-together 60 customers interacted with print contents, while 109 customers interacted with multimedia. Those numbers were divided according to the reason of visit. Each customer in both samples has been marked with an input level. There are three types of input levels: 0 (no engagement

was made), 1 (engagement was made with only one type of content), and 2 (engagement was made with both multimedia and print content). All-together 37 respondents read print content since they consider it as a reliable source of information, 42 of them think that they can find there all needed information and 33 of them consider information very clear and easy to understand. Customers' reasons of engaging with multimedia are mostly related with content, fun and entertaining (69 respondents), eye catching content (84 respondents) and content which has occupied their attention while waiting (103 respondents). Table 4 near here presents the results using z-testing.

|                              | Variable 1 | Variable 2 |
|------------------------------|------------|------------|
| Mean                         | 1.14728682 | 0.29577465 |
| Known Variance               | 0.42345    | 0.325553   |
| Observations                 | 129        | 71         |
| Hypothesized Mean Difference | 0          |            |
| Z                            | 9.59983755 |            |
| P(Z<=z) one-tail             | 0          |            |
| z Critical one-tail          | 1.64485363 |            |
| P(Z<=z) two-tail             | 0          |            |
| z Critical two-tail          | 1.95996398 |            |

Table 4: Determining veracity of H1 using z-testing

For the given variances and means, z value equals 9.59983755, and P-value of one-tail is zero (0). In cases where P-value is lower than alpha ( $\alpha$ ), null hypothesis is rejected. Therefore, there is enough evidence to claim that the level of engagement with in-store materials at HT is higher for customers whose reason of visit has positive purpose.

## H2: Validation

- Null hypothesis (Ho):  $\mu_1 - \mu_2 \leq 0$ ; Alternative hypothesis (Ha):  $\mu_1 - \mu_2 > 0$
- Variable 1: customers who asked for additional information about multimedia content they interacted with; Variable 2: customers who either did not ask for additional information about multimedia content they interacted with, or did not interact with multimedia content
- $n_1 = 85$ ,  $n_2 = 44$

Out of 109 customers who interacted with multimedia contents, 44 customers (40%) asked sales representatives more information. The objective was to prove that higher percentage of sales was made by customers who asked for more information about the advertised offer on multimedia

screens. If null hypothesis proves to be correct, then the statement that multimedia contents at HT POS are the main sales driver is correct as well. Each customer in both samples has been marked with an input level. There are two types of input levels: 0 (no sale was made), and 1 (sale was made). Table 5 represents the results using z-testing.

|                              | Variable 1 | Variable 2 |
|------------------------------|------------|------------|
| Mean                         | 0.56470588 | 0.61363636 |
| Known Variance               | 0.248739   | 0.2426     |
| Observations                 | 85         | 44         |
| Hypothesized Mean Difference | 0          |            |
| Z                            | -0.5326094 |            |
| P(Z<=z) one-tail             | 0.29715199 |            |
| z Critical one-tail          | 1.64485363 |            |
| P(Z<=z) two-tail             | 0.59430398 |            |
| z Critical two-tail          | 1.95996398 |            |

Table 5: Determining the veracity of H2 using z-testing

For the given variances and means, z value equals -0.53526094, and P-value of one-tail is 0.29715199. In cases where P-value is higher than alpha ( $\alpha$ ), null hypothesis is accepted. There is not enough evidence to claim that multimedia contents at HT POS are the main sales driver.

### H3: Validation

- Null hypothesis (H<sub>0</sub>):  $\mu_1 - \mu_2 \leq 0$ ; Alternative hypothesis (H<sub>a</sub>):  $\mu_1 - \mu_2 > 0$
- Variable 1: customers who rated in-store promoter's presentation skills as 'excellent'; Variable 2: customers who rated in-store promoter's presentation skills as either 'very good', 'good', 'poor', or 'very poor'
- $n_1 = 49$ ,  $n_2 = 61$

Out of 110 customers who got an opportunity to meet vendor's promoter, 49 customers (44.55%) rated promoter's presentation skills as 'excellent'. Additionally, customers who rated promoter skills as excellent purchased a mobile device in higher percentage compared with those customers who rated promoter's skills as poor or just as good. Each customer in both samples has been marked with an input level. There were two types of input levels: 0 (not purchasing a mobile device), and 1 (purchasing a mobile device).

|                              | Variable 1 | Variable 2 |
|------------------------------|------------|------------|
| Mean                         | 0.51020408 | 0.3442623  |
| Known Variance               | 0.255102   | 0.229508   |
| Observations                 | 49         | 61         |
| Hypothesized Mean Difference | 0          |            |

|                     |            |  |
|---------------------|------------|--|
| Z                   | 1.7522404  |  |
| P(Z<=z) one-tail    | 0.03986624 |  |
| z Critical one-tail | 1.64485363 |  |
| P(Z<=z) two-tail    | 0.07973248 |  |
| z Critical two-tail | 1.95996398 |  |

Table 6: Determining veracity of H3 using z-testing

For the given variances and means, z value equals 1.7522404, and P-value of one-tail is 0.03986624. In cases where P-value is lower than alpha ( $\alpha$ ), null hypothesis is rejected. There is enough evidence for this hypothesis to be accepted.

#### H4: Validation

- Null hypothesis (Ho):  $\mu_1 - \mu_2 \leq 0$ , Alternative hypothesis (Ha):  $\mu_1 - \mu_2 > 0$
- Variable 1: customers who rated sales representative's attitude as 'friendly'; Variable 2: customers who rated sales representative's attitude as either 'neutral', or 'unfriendly'
- $n_1 = 71$ ,  $n_2 = 58$

Customers with positive reason of visit were asked to evaluate sales representative's attitude. All-together 71 of them rated it as 'friendly'. Customers were also asked to evaluate the overall customer service. All-together, 56 customers rated it as 'very satisfactory'. Each customer in both samples was marked with an input level. Input levels were grades for evaluating overall customer service: 5 (very satisfactory), 4 (satisfactory), 3 (neutral), 2 (unsatisfactory), and 1 (very unsatisfactory). Table 7 near here presents the results using z-testing.

|                              | Variable 1  | Variable 2  |
|------------------------------|-------------|-------------|
| Mean                         | 4.422535211 | 3.948275862 |
| Known Variance               | 0.504628    | 0.6464      |
| Observations                 | 71          | 58          |
| Hypothesized Mean Difference | 0           |             |
| Z                            | 3.510407451 |             |
| P(Z<=z) one-tail             | 0.00022371  |             |
| z Critical one-tail          | 1.644853627 |             |
| P(Z<=z) two-tail             | 0.000447421 |             |
| z Critical two-tail          | 1.959963985 |             |

Table 7: Determining veracity of H4 using z-testing

For the given variances and means, z value equals 3.510407451, and P-value of one-tail is 0.00022371. In cases where P-value is lower than alpha ( $\alpha$ ), null hypothesis is rejected. Therefore, there is enough evidence for this hypothesis to be accepted.

#### H5: Validation

- Null hypothesis (Ho):  $\mu_1 - \mu_2 \leq 0$ , Alternative hypothesis (Ha):  $\mu_1 - \mu_2 > 0$
- Variable 1: customers who are price sensitive when buying a perfume; Variable 2: customers who are price insensitive when buying a perfume
- $n_1 = 136$ ,  $n_2 = 99$

All-together 58% of customers who browsed the shelf with perfumes were price sensitive, while the remaining 42% do not consider price being a limiting factor. Each customer in both samples has been marked with an input level. There are two types of input levels: 0 (not recognized red price tags), and 1 (recognized red price tags).

Table 8 near here presents the results using z-testing.

|                              | Variable 1  | Variable 2  |
|------------------------------|-------------|-------------|
| Mean                         | 0.669117647 | 0.373737374 |
| Known Variance               | 0.223039    | 0.236446    |
| Observations                 | 136         | 99          |
| Hypothesized Mean Difference | 0           |             |
| Z                            | 4.653917067 |             |
| P(Z<=z) one-tail             | 0.00000163  |             |
| z Critical one-tail          | 1.644853627 |             |
| P(Z<=z) two-tail             | 0.00000326  |             |
| z Critical two-tail          | 1.959963985 |             |

Table 8: Determining veracity of H5 using z-testing

For the given variances and means, z value equals 4.653917067, and P-value of one-tail is 0.00000163. In cases where P-value is lower than alpha ( $\alpha$ ), null hypothesis is rejected. There is enough evidence for this hypothesis to be accepted.

#### H6: Validation

- Null hypothesis (Ho):  $\mu_d = 0$ , Alternative hypothesis (Ha):  $\mu_d \neq 0$
- Variable 1: customers evaluating L'Oréal's offer; Variable 2: customers evaluating Dove's offer
- $n = 212$

Customer evaluated both Dove and L'Oréal offer demonstrating later their purchase intentions before and after becoming aware of the special offer. Only 10 customers intended to buy a L'Oréal product,

while 82 customers intended to buy a Dove product. After becoming aware of the offers, 122 customers were intrigued about the L'Oréal offer, while 105 customers were interested about the Dove offer. In order to correctly determine the veracity of this hypothesis, grades used for evaluating the offers on a scale from one (1) to five (5) were the inputs for both variables. For this hypothesis, t-testing is used to determine if there is any difference between the variables. Table 9 near here presents the results using z-testing.

|                              | Variable 1  | Variable 2  |
|------------------------------|-------------|-------------|
| Mean                         | 4,528301887 | 4,264150943 |
| Variance                     | 0,411517482 | 0,546007333 |
| Observations                 | 212         | 212         |
| Pearson Correlation          | 0,514061169 |             |
| Hypothesized Mean Difference | 0           |             |
| Degree of freedom (df)       | 211         |             |
| t Stat                       | 5,609045566 |             |
| P(T<=t) one-tail             | 3,17E-08    |             |
| t Critical one-tail          | 1,652107286 |             |
| P(T<=t) two-tail             | 6,33837E-08 |             |
| t Critical two-tail          | 1,971270646 |             |

Table 9: Determining veracity of H6 using z-testing

For the given variances and means, t value equals 5.609045566, and P-value of one-tail is 0.0000000317. In cases where P-value is lower than alpha ( $\alpha$ ), null hypothesis is rejected. There is enough evidence for this hypothesis to be accepted.

## CONCLUSION AND IMPLICATIONS

HT as a market leader in the telecommunication industry implement many different in-store contents. The company is emphasizing digital trends and focuses on multimedia. Research results show that more customers are prone to rather engage with multimedia contents than print. Although it was not proven that higher percentage of sales was made by customers who asked for more info about the offer they engaged with, multimedia contents contribute in creating additional revenues. It is proven that customers' satisfaction with in-store promoters creates a stronger desire for purchasing and that the level of engagement is higher for customers whose reason of visit is positive. Friendly attitude of sales representative can positively affect customer's attitude and is highly correlated with customers' satisfaction with the overall service. Dm is the customers' most favorite place to do shopping of FMCG. Although the level of investment in in-store marketing activities is not as high as in the telecommunications industry, dm implements special techniques that enable differentiation and

customization. It is proven that dm customers who are price sensitive better recognize and react to price tag differentiation and that implementation of shelf wobblers at dm POS is more efficient for promotions which include a monetary benefit. Although online communication and digital marketing rapidly grow, research findings show that traditional retailing will retain its primary function. Therefore, retail marketing will remain one of the most important channels for direct communication and creating awareness among customers in telecommunication and FMCG industry.

## **“M&A VERSUS ALLIANCE” DECISIONS: INSIGHTS FROM THE THIRD-PARTY LOGISTICS INDUSTRY**

**Profumo, Giorgia; Scarsi, Roberta**

Department of Economics and Business Studies, University of Genoa, Genova, Italy

### **ABSTRACT**

Mergers and acquisitions (M&As) and alliances are potential alternative choices for managers, which involve balancing several dimensions, and that only rarely have been compared as substitutes.

The present paper attempts to advance knowledge in the understanding of such firms' external strategy implementation paths. In particular, it aims to develop a model for interpreting the drivers of such decisions, based on (1) the level of riskiness and complexity of the industry, (2) the criticality of the acquired re-sources and competencies for the competitive advantage of the acquiring firm.

The theoretical model is then applied to the third-party logistics industry through a qualitative analysis on four case studies: DHL Supply Chain & Global Forwarding, DB Schenker, CH Robinson, XPO Logistics. The third-party logistics industry is indeed an ideal set for studying such issues as, in the last few years, it has undergone significant changes which have increased the number of M&A and strategic alliances.

The results show that, in the third-party logistics industry, the two aforementioned dimensions are indeed important in firms' choice between M&As and alliances, highlighting the presence of homogeneous behavioral models among logistics services providers. This contribution presents some valuable research implications, useful for researchers and academics, but also professionals and policy makers may benefit from this knowledge.

*Keywords: M&A, alliance, third-party logistics industry.*

### **INTRODUCTION**

The present paper tries to investigate the drivers of logistics service providers' strategy implementation, focusing on mergers and acquisitions (M&As) and alliances as potential alternative choices for managers, with the aim of addressing what are the factors which push a company towards M&As on one side or alliances on the other side. The choice between alliances or acquisition has been a strategic challenge to managers and scholars since no optimal rule of selection between the two options has been set so far (Dyer et al., 2004) and the logistics industry is an ideal set for studying such issues.

Third-party logistics (3PLs) companies, a common definition for service logistics providers, are experiencing significant challenges in recent years due to growing competition and changing customer expectations towards interconnected high-standard services at low cost (Kiesel *et al.*, 2017). Globalization, lead time reductions, and customer orientation are only some of the major changes impacting on this industry: as the role of logistics providers has changed both in content and in complexity and the amount of successful factors is subject to growth and development (Ab Talib *et al.*, 2015). Critical success factors of supply chain management: a literature survey and Pareto analysis. EuroMed Journal of Business., new firms from different fields entered the market competing with the traditional transport and warehousing firms (Hertz and Alfredsson, 2003).

The situation has become even more complex with the emergence of the financial crisis: in the years after the crisis, logistics services providers have faced a high competitive pressure due to the constant decline in international trade (Deutsche Bank, 2016) and also the digitization process has created new challenges due to changing customer expectations.

To cope with these disruptions, many companies began to search for external growth to realize operational efficiencies and exploit productive opportunities of new markets and diversified services (Kiesel *et al.*, 2017). Such growth has been achieved by different strategic paths.

On one hand, the increasing turbulent environment has forced logistics operators towards a constant growth of the number of M&As (accordingly to Kiesel *et al.* (2017), 2015 became the most active year for M&A in logistic service industry) that lead to a major level of industry concentration; on the other hand, logistics service providers have been involved in several strategic alliances with other partners belonging to the same supply chain (vertical) or competitors (horizontal).

Vertical logistics alliances have emerged as a response to the increasing out-sourcing of logistics functions to 3PLs in the '80, and since then, vertical alliances among supply chain actors, such as manufacturers, suppliers, retailers and customers and 3PLs, have become more and more important (Crujissenet *et al.*, 2007; Daugherty, 2011). They cover 'long-term formal or informal relationships between shippers and 3PLs to render all or a considerable number of logistics activities' (Bagchi and Virum, 1998), or, in other words, a comprehensive partnership arrangement including a broad, or a complete, range of products and services.

Moreover, over the last decades, horizontal alliances between logistics service providers have become a well-established organizational form and their use is expected to grow even further in the future (Raue and Wieland, 2015).

So far, no studies have focused on the drivers of the choice between M&As and alliances and therefore our aim is to answer to the following research question:

RQ: Which are the antecedents of firms' choice between mergers and acquisitions (M&As) and alliances?

More specifically, we propose a model for interpreting the drivers of such decisions based on two dimensions: (1) the level of riskiness and complexity of the industry, (2) the criticality of the acquired resources and capabilities for the competitive advantage of the acquiring firm.

The theoretical model is then applied to the third-party logistics industry, through a qualitative analysis on four case studies, focused on their M&As and alliances.

In seeking to answer to the aforementioned research question, the present study contributes to extant academic literature in several ways. It develops logistics management literature by exploring the strategic motivations of mergers and acquisitions (M&As) and alliances implemented by 3PL companies. Moreover, the manuscript extends the strategic management literature developing an overall conceptual framework on the antecedents of the choice between M&As and alliances. In fact, while alliances and M&As are typically considered to be alternative choices for firms interested in combining their resources (Wang and Zajac, 2007), relatively little is known as to when firms should pursue one vs. the other (Profumo, 2017). The proposed model could also be applied to other industries, in order to test its validity. The study has also several valuable implications for both managers and policy makers.

## **LITERATURE REVIEW: THE DRIVERS OF EXTERNAL GROWTH STRATEGIES**

The success and value creation of firms' corporate strategies deeply depend on the implementation paths chosen by managers. That's why a wide international literature belonging to economic, legal, financial, and managerial backgrounds has already developed on the theme (Jensen and Ruback, 1983; Shleifer and Vishny, 1988; Seth, 1990; Rozen-Bakher, 2018).

A thorough analysis of the strategic management literature highlights the scarcity and fragmentation of comparative studies aiming at understanding the drivers inducing a company to choose among the different external growth modes and, specifically, between M&As on one side, and alliances on the other (Hennart and Reddy, 1997; Garette and Dussauge, 2000; Wang and Zajac, 2007; Yin and Shanley, 2008; Profumo, 2017; Mellewigt *et al.*, 2017; Penco and Profumo, 2019). Prior research has, in fact, specialized on one instrument but not the other and only few studies have considered the two growth modes interchangeable (Wang and Zajac, 2007; Mellewigt *et al.*, 2017).

In the choice between internal and external growth strategies, "time" and "complexity" represent the key drivers. If a quick action is essential to gain a competitive advantage, the external growth strategy implementation will be preferred to the too slow process represented by the endogenous development.

On the contrary, the drivers relevant to the choice among the different external growth strategies have not come out clearly yet. According to the resource dependence theory and the transaction cost theory, Yin and Shanley (2008) identified in the trade-off between commitment and flexibility the choice between M&As and alliances. Hence, in the most unstable and risky businesses, it is likely the demand of flexibility to prevail, thus preferring collaborative forms of growth, whilst in businesses where large investments are required – e.g. to exploit economies of scale and of scope – the commitment will be chosen thus favoring more stable forms of partnerships.

By focusing their attention on the resources and capabilities of the enterprises involved in the growth process and using the resource-based view of the firm, Wang and Zajac (2007) remarked that the more resource similarities and expertise between the companies present, the more they will tend to choose M&As rather than alliances; on the contrary, high levels of resource complementarity of two firms are more likely to trigger companies to choose alliances rather than M&As. Mellewigt *et al.* (2017), instead, found that partner-specific trust pulls towards alliances, while value certainty pulls towards acquisitions.

By analyzing the investments of the Japanese firms in the United States, Hennart and Reddy (1997) inferred that joint ventures are preferred when the targeted assets are strictly linked to unneeded assets, thus making M&A less “digestible”. They also showed that the greater the enterprise knowledge of the new business market, the higher will be its proclivity to plan M&As rather than collaborative relationships. Vanhaverbeke *et al.* (2002) reported, instead, that prior knowledge developed with alliances between two companies increases the probability of M&As.

On the other hand, Penco and Profumo (2019) highlighted that the implementing logic discriminants of the corporate strategies are triggered by the importance of the acquired resources and capabilities for winning the competitive game as well as on the business risk and complexity degree of the industry.

Following the proposals of Yin and Shanley (2008) and Penco and Profumo (2019), an interpretive model of the external growth strategies should be based on these two variables: (1) riskiness and complexity of the business in which the firm is operating, or would like to operate, (2) the criticality of the target resources and capabilities for the competitive advantage of the acquiring firm (Figure 1).

The acquisition of control rights implies greater risks for companies compared to alliances due to its lack of flexibility and reversibility, but it also enables the total control and the resource exploitation of the acquired entity (Yin and Shanley, 2008).

On the other side, when the environmental complexity and the risk level of the industries in which the firm wants to invest, are sharpening, the firm will tend to seek collaborative forms of growth in order to share the risk incurred (risk sharing) and to curb the resources and expertise assigned to its growth. From this view-point, the risk level could also increase with the raise of the transaction costs, including

those related to the lack of knowledge of the market in which the firms want to grow, as already pointed out by Balakrishnan and Koza (1993).

|                                       |      |  |     |   |
|---------------------------------------|------|--|-----|---|
| Risk Level and<br>Business Complexity | High | Non-Equity<br>Agreements<br>Alliances<br>(B) | and | Equity Agreements<br>and Alliances<br>(C) |
|                                       | Low  | Market Transactions<br>(A)                   |     | M&A<br>(D)                                |
|                                       |      | Low  |     | High                                      |

Resource criticality to gain the competitive advantage

Figure 19. The implementation of the external growth strategies.

The quadrant (A) features low business complexity, low risk levels and limited criticality of the new resources and capabilities to attain the competitive advantage. In this case, the external growth involves low complex and low risk businesses, where no destabilizing variables emerged over the time. When the target industry identified by the firm for its growth, is not so risky and complex due to previous knowledge or similarity to the firm original business activity, less transaction costs from market imperfections are likely to emerge; if the assets are not mainly firm-specific, no significant advantages will derive in adopting M&A and agreements, or alliances, in comparison to mere market transactions which are less expensive. Therefore, according to the proposal of Yin and Shanley (2008), it is possible to postulate that, in this quadrant, the growth is implemented through market transactions, which enable faster target achievements with little financial outlays.

In the quadrant (C), the business risk and complexity levels are high and the acquired resources and capabilities are challenging. This quadrant is, definitely, the most complex to understand, since the two axes highlight opposite trends.

On the one hand, the high complexity and risk level of the business chosen by the growing firm leads to employ collaborative arrangements aiming at limiting risks and invested resources. This could be the case when the new industries are very “distant” from the starting one. But, on the other hand, the criticality of the new resources, capabilities and knowledge seems to push towards solutions with a higher degree of control.

Hence, this quadrant shows external growth modes based on collaborative arrangements with higher control levels, such as equity agreements (for example, joint ventures). In industries very different from the original one, resulting from vertical integration strategies or diversification, or in case of entry in new geo-geographical markets of the same industry far (in terms of knowledge) from home markets, such

growth modes allow to better face the risk among the partners and, at the same time, to exercise some control by taking part in risk capital.

The two dimensions shown in the quadrants (B) and (D) are highlighting opposite levels thus being more easily understood. In the first case, the high risk and complexity level of the industry is offset by the lower importance of the control on the resources and capabilities. In these cases, the non-equity alliances seem to be more suitable to the purpose, since they do not need the full control on the new resources and capabilities.

On the contrary, the quadrant (D) features a low level of business risk and un-certainty against a high degree of criticality of the resources and capabilities for the competitive advantage of the acquiring company. In this case, growth should be implemented through merger and acquisition operations since target industries seem “known” by the firms, developing low transaction costs, and the full control of the new resources and knowledge is crucial to achieve competitive advantages. Therefore, market transactions are not advantageous. We can locate in this quadrant the M&A transactions aiming at increase firm’s market share in the same industry and attaining collusive synergies.

## METHODOLOGY

Case studies are particularly useful when the topic of the research is the understanding of complex phenomena (Yin, 1994). The case study design adopted in this manuscript may be described as a multiple case study (Eisenhardt, 1989; Yin, 1994). Multiple case designs are, in fact, appropriate when a researcher wants to achieve a deep understanding of a specific multidimensional complex phenomenon, such as corporate strategies and their implementation paths, going beneath the surface of a situation and using a replication strategy (Eisenhardt, 1989).

The chosen cases regard four of the major 3PLs companies, belonging to the first ten ranking positions of the “Top 50 Global Third-Party Logistics Providers (3PLs) List” released by Armstrong & Associated and that have implemented an intense wave of M&As and alliances in the last few years (Table 1): DHL Supply Chain & Global Forwarding (position 1 in the global ranking), DB Schenker (ranked third), CH Robinson (ranked fifth), XPO Logistics (ranked seventh).

| Company       | 2018 Revenues (US\$ billion) | Gross Countries | Headquarters | Parent Company |
|---------------|------------------------------|-----------------|--------------|----------------|
| DHL SC & GF   | 28.1                         | 220             | Germany      | Deutsche Post  |
| DB Schenker   | 19.9                         | 125             | Germany      | Deutsche Bahn  |
| C.H. Robinson | 16.6                         | 80              | USA (MN)     | -              |
| XPO Logistics | 17.3                         | 30              | USA (CT)     | -              |

Table 1: Key data of the four selected companies (Armstrong & Associated, 2020, Corporate’s

websites, 2020).

The focus on the third-party logistics industry is related to the fact that it is a very heterogeneous industry (Spinelli and Scarsi, 2017) that is moving towards a progressive concentration and services differentiation at the top. In the last twenty years, many M&A operations have been registered, involving almost all the top global 3PLs. Also cooperation has grown in importance and today more than half of 3PLs are engaged in one or multiple alliances with other 3PLs (Raue and Wieland, 2015).

In order to develop the cases, we collected heterogeneous data exploring different topics:

- The principal features of the different companies and their businesses;
- The evolution of their corporate strategies;
- Number, typologies and characteristics of M&As and alliances of each company;
- The motivations behind the different strategy implementation instruments (M&A and alliance) used by the companies.

For analyzing all the previous topics, the authors have collected all the necessary data, using multiple data collection techniques:

- analysis of the Capital IQ Standards & Poor Database for gathering information on M&As, alliances (equity and non-equity) and partnerships developed in the last 15 years (2004-2019). As regards M&As, such database has been integrated with the "3PL Mergers & Acquisitions Tracking List" of Armstrong & Associated for completeness.
- analysis of several secondary sources for each operation (M&A and alliance) identified from the database. In particular: company's press releases, company's web sites, investor presentations, Annual Reports, articles from magazines and newspapers;
- personal semi-structured interviews with two consultants, experts of the 3PL industry on the trends of the industry and on the perceived drivers of external growth.

The case studies were built from data gathered from primary and secondary sources and were written independently of each other, to maintain the independence of the replication logic Spiggle (1994). The interviews' data have been integrated with information from secondary sources to provide further background and help to triangulate the data. Guided by our theoretical framework, we then built the insights emerging from the case studies.

## **M&AS AND ALLIANCES IN THE THIRD-PARTY LOGISTICS INDUSTRY: THE RESULTS OF FOUR CASE STUDIES**

### *DHL Supply Chain & Global Forwarding*

DHL Supply Chain & Global Forwarding, a division of Deutsche Post, with an annual gross revenue around 30 billion US\$, is the first 3PL in the world ranking.

DHL Supply Chain & Global Forwarding is indeed the result of a progressive series of acquisitions that led to a quantitative and qualitative growth of the original company. After acquiring the full ownership in 2002, Deutsche Post began the process of repositioning of DHL, at that time an express courier. The parent company entered the 3PLs industry with the acquisition in 1999 of the Swiss logistics provider Danzas, one of the world leading logistics companies. In 2003, the entire express business (formerly DHL) and logistics business (formerly Danzas) were bundled under the DHL brand, thus declaring the top role of the group in the logistics industry. In 2005, Deutsche Post was the author of the main M&A operation ever happened so far in the 3PLs industry: it acquired the U.K. based company Exel, at that time the world second major 3PL. Over the years, the company made other acquisitions in order to establish or expanding its roots in new markets (we can insert these operations in the quadrant D of Figure 1): Europe (Nedlloyd Logistics, 1999; MIT Safetrans, 2016), USA (Air Express International, 2000; Airborne Express, 2003), India (Blue Dart Express, 2005), Latin America (Suppla Group, 2018).

In the meanwhile, the company established a series of strategic alliances with other companies operating in the freight forwarding and logistics industries (Easyship Fulfillment Serviced, Empost, S.F. Holding Co., Sinotrans, Trade Shipper Cargo, etc.), transport management (China Airlines, Lufthansa Cargo, AirAsia Group Berhad, Emirates SkyCargo, Ethiopian Airlines, Fukuyama Transporting Co., Interstate Transport, Inc., etc.), facilities management (Airport Authority Hong Kong), IT management (Coehalo Inc., Cybits Holding, Huawei Investment & Holding Co., Quadient, AT&T Inc., BT Group, SAP, etc.), thus implementing its offered services and its global network.

In some cases, these alliances are formalized and involve equity participations, thus positioning in quadrant C Figure 1, including collaborative agreements characterized by high control level due to the combination of high risk (e.g. new markets) and challenging resources and capabilities. We can for example cite the joint venture DHL-Ethiopian Airlines Logistics Services Limited signed between DHL Supply Chain & Global Forwarding and Ethiopian Airlines (July 2018). The aim of the partnership was to become a leading cargo logistics provider in Africa.

Other alliances assumed a less structured form, thus not concerning very critical resources and capabilities to be acquired (quadrant B Figure 1). We can cite among these the memorandum of understanding signed between DHL Supply Chain & Global Forwarding and the Project Office OTLK LLC (comprehending Russian Railways, Kazakhstan Temir Joly/ Kazakhstan Railways and Belarusian Railways), in March 2014. According to the memorandum, the parties agreed to be-come strategic partners in order to develop jointly railway routes between China - Europe - China and provide door-to-door container shipping services.

*DB Schenker*

With a gross revenue of around 20,000 million US\$, DB Schenker is currently the third world 3PL. Schenker has a story of about 150 years: it was born in Austria in 1872 as a freight forwarder and, in 1931, it was acquired by Deutsche Bahn, the German public rail company.

In 2002, Deutsche Bahn acquired the control of Stinnes (formerly Schenker) and renamed the business unit DB Schenker. In 2006, Deutsche Bahn considerably strengthened its position in the global logistics market with the acquisition of the American 3PL BAX Global (quadrant D Figure 1). The expansion process through new markets was carried out by other acquisitions (Transportes Ferroviarios Especiales, 2007; English Welsh & Scottish Railway Holding, 2007; Romtrans, 2009) and alliances (implying in some cases proprietary relationships) with foreign operators (Seino Holdings Co., Japan; Joyau, France; Spedpol, Po-land; Linjegods, Norway; Spain-TIR, Spain; Khimji Ramdas, Oman; DSB, Den-mark; Public Joint Stock Company TransContainer, Russia).

As regards alliances, most of them were oriented to provide value-added services, completing the range of offered services: in 2009, for example, Schenker Of Canada Limited announced its business partnership with NowPac Inc.-one of Canada's leading providers of co-packing, display design and build, and product conversion. The partnership was focused on providing value-added services to both existing and new customers across Canada (quadrant B Figure 1).

Specifically referring to the DB Schenker commitment on IT research, we can cite the joint venture between the company, MAN Truck & Bus and Hochschule Fresenius: it began in 2017 with the aim to develop networked and autonomous driving in transport logistics. The project sees for the first time a logistics provider and a vehicle manufacturer cooperating to develop networked truck convoys to use in the logistics business. In this case, the high risk (new technology) and the mix and criticality of the required resources and capabilities led to the choice of an equity agreement (quadrant C Figure 1).

#### *C.H. Robinson*

C.H. Robinson is the 3PLs industry leader in the USA and number five in the world ranking (Armstrong & Associated, 2020, data referred to 2018). The company has a long tradition; it was born in the early '90s as a wholesale brokerage house. The company progressively became a leader in freight transportation, supply chain logistics, and outsourcing. The development pattern of C.H. Robinson is characterized by the coupling of a continuous and progressive internal growth with a long series of acquisitions. The peculiarity consists in an acquisition plan spread over a long period of time (20 acquisitions over 22 years) and involving quite small target companies (the total purchase price is around 1,600 million US\$), so that the path was particularly linear and "digestible" and did not impact too much on the company's profitability, but permit to the company to reach a leadership position (quadrant D Figure 1).

The more expensive acquisition operated by C.H. Robinson refers to Phoenix International (2012, 635 million US\$), a privately-held international freight forwarder providing international freight forwarding services, including ocean, air, and customs brokerage, and Freightquote.com (2015, 365 million US\$), one of the largest internet-based freight brokers in the United States, providing truckload, less than truckload and intermodal services. The main part of the acquisitions (with some exceptions) refers to other USA companies, but C.H. Robinson progressively improved its global presence by opening several offices in Canada, South America, Europe, China, and India. The Oceania market was reached through the acquisition, after a long-standing exclusive agent relationship, of APC Logistics, the largest independently owned freight forwarding and customs brokerage services provider in Australia and New Zealand (2016, purchase price 225 million US\$).

The company does not seem to be part of any strategic horizontal alliance.

#### *XPO Logistics*

XPO Logistics is a quite young company. Born in 1989 in the USA, after a long series of acquisitions, it achieved five years ago the top twenty 3PLs ranking, reaching number seven world position in 2018 and number two in the USA.

It was born as a freight forwarder, with a high specialization in high value/ urgent freights. It was acquired in 2011 by the businessperson Bradley Jacobs, re-named XPO Logistics and listed on the New York Stock Exchange. From 2012 to 2015, XPO Logistics acquired 17 companies, for a total purchase price of over 8 billion US\$.

The main acquisitions refer to market leaders, with primary operating areas in either North America or Europe. In particular, in 2013, XPO acquired 3PD, a North America based 3PL specialized in heavy goods logistics for 375 million US\$. In 2014, it acquired Pacer International, a major provider of intermodal services in USA, Canada and Mexico, for 335 million US\$. In 2014, it acquired for 615 million US\$, New Breed Holding Company, a North American company providing, through its subsidiaries, warehousing distribution, transportation and supply chain management, aftermarket, and manufacturing support services, visibility, control, freight, and management logistics system services. In 2015, XPO strongly reinforced its presence in the European market by acquiring for 3,530 million US\$ Norbert Dentressangle (France), a major European transport, logistics and freight forwarder. In 2015, XPO also acquired, for 3,500 million US\$, Conway which was at that time the second largest less-than-truckload transport provider in North America, confirming its willingness to increase its leadership in the market (quadrant D Figure 1).

The company does not seem to be part of any strategic horizontal alliance. As regards vertical alliances, we can report the use of cooperation as a way to improve its capabilities and/or test new risky services/ technologies (quadrant B figure 1). E.g., in June 2018 XPO Logistics agreed with Nestle to jointly build a

638,000-square-foot distribution centre at the new SEGRO East Midlands Gateway Logistics Park in Leicestershire, UK. The facility would be predominantly used by Nestlè for its consumer packaged goods, but would also serve as a testbed environment for XPO technology prototypes prior to global release. The site features advanced sorting systems and robotics alongside automation co-developed with Swisslog Logistics Automation to ensure faster and efficient distribution.

**DISCUSSION**

The analysis of the four case studies showed that, in the choice between M&As and alliances, the proposed interpretative model on the logics of the external growth strategies could be useful for responding to our research question on the antecedents of firms’ choice between M&As and alliances.

Figure 2 shows the original model in which the main strategic drivers of the 3PLs companies are marked.

The majority of acquisitions made by the companies were of horizontal nature and helped expansion purposes in terms of geography and market positioning, as already highlighted by Kiesel et al. (2017).

These growth paths may be placed in the (D) quadrant of the model and respond to the general driver “Seeking market leadership” (Penco and Profumo, 2019). M&A processes have been central to obtaining competitive advantage for the four companies whose purpose is attaining a global leadership, eliminating a current competitor.

Figure 2. 3PLs companies’ implementation of external growth strategies.

The activities into which the service logistics providers have expanded are “well-known” because they belong to the same business and therefore do not present very high levels of risk or complexity. On the

other hand, the full control of resources and capabilities has been fundamental for reaching collusive synergies (Garette and Dussauge, 2000).

In the last few years, the importance of alliances has emerged. Equity agreements have been used for entering new markets characterized by high risk (e.g. developing countries) with challenging resources and capabilities, critical for attaining the competitive advantage. Such alliances, in particular joint ventures, can be placed in the (C) quadrant of the model (“Acquiring control of critical resources in new risky markets”).

When activities that companies want to control are both complex and critical for competitive advantage, 3PLs companies often opted for equity alliances, that sometimes led to vertical M&As (D quadrant). This is the case of IT research for developing networked and autonomous driving in transport logistics, which DB Schenker wants to control for future competitive advantage.

The collaborative mode which is based on “strong” equity control is more flexible than M&As, especially in order to better explore new unknown geographical markets (Carbone and Stone, 2005), that are more complex and risky to interpret, sometimes with completely different cultures, such as Ethiopia (DHL Supply Chain & Global Forwarding). In these cases, the regulatory and operational support of the local firm is an essential and complementary competence for entering the markets which are considered critical for the companies (Wang and Zajac, 2007).

When the resources and capabilities to be attained are not particularly critical for the competitive advantage of the acquiring company, and the new industries are unfamiliar and “distant” from the service logistics core business, 3PLs firms seem to use collaborative forms of non-equity growth as shown in the B quadrant, in particular related to the driver “Completing the range of offered services”. Following the results of Penco and Profumo (2019), 3PLs companies tend to use such form of alliance for providing value-added services with a complete range of logistics services. This is the case of the collaboration between DB Schenker (Canada) and the Canadian leading providers of co-packing and display design.

In relation to the (A) quadrant, considering the complex articulation of the logistic services, companies make abundant use of market transactions. Such transactions are used when 3PLs companies are dealing with low market complexity, and resources and capabilities held by partners are not critical for the competitive advantage.

## CONCLUSION AND IMPLICATIONS

This paper aimed at contributing to the existing knowledge on the drivers of logistics service providers’ strategy implementation, focusing on M&As and alliances as alternative choices for managers. We addressed, in particular, four case studies, related to some of the major logistics service providers

operating at an international level and which have implemented an intense wave of M&As and alliances in the last few years.

From a theoretical standpoint, our paper contributes to existing literature in several ways. It extends the strategic management literature developing a conceptual model of the drivers of the choice between M&As and alliances. In fact, while alliances and M&As are typically considered alternative choices for firms interested in combining their resources (Wang and Zajac, 2007), literature has relatively little focused on when firms should pursue one vs. the other (Yin and Shanley, 2008; Profumo, 2017). Moreover, it develops logistics management literature by exploring the strategic motivations of mergers and acquisitions and alliances employed by 3PL companies.

From a managerial point of view, the paper contributes to outline the relevance that certain resources and capabilities present for the competitiveness of 3PLs companies. In particular, the importance of offering value-added services with a complete range of logistics services.

Despite this paper offers important causes for reflection on “M&A versus alliance” decisions, it suffers of some inherent limitations. The paper, in particular, has the typical limitations inherent to the case-study methodology (Yin, 1994), in relation to the replicability of results. Further research will therefore have to extend the number of cases or to verify the applicability of the model to other industries.

### ABSTRACT

**Purpose** – *Masters in Business Administration is the most sought-after post-graduate program in the country. However, not much is known about how past academic performance and under-graduate degree of students influences the performance in MBA programs. Given the fact that recruiters have been expressing concern about the employability of MBA graduates, it is very critical that MBA institutes put in place an objective admission criterion. With this background, this study tries to answer whether past academic performance and the type of under-graduate degree matters for MBA performance. The study also explores if there is any difference between performance of students in a regular MBA program with the of a foreign collaborative MBA program.*

**Design/methodology/approach** – *The study is based on information of students from two academic year from one B-school located in Mumbai, India. The total number of students' information used in the study is 254. The study uses a two-sample t-test to determine if there is any difference in present and past performance of student enrolled for regular MBA program with that for foreign collaborative MBA program. Further, a multiple regression model is used to identify the factors that influences the MBA performance.*

**Findings** – *Our study reveals that performance in regular MBA program is better compared to the foreign collaborative MBA program. In terms of explaining the MBA performance, past academic performance starting from school final does matter but the type of degree in the under-graduate program doesn't. The findings suggest that quality of student matters.*

**Research limitations/implications** – *The findings of our study have serious and important implication of designing admission criterion of MBA programs. Institute must pay due importance to students' past academic performance while there is no requirement to select students based on their under-graduate degree. The scope of the study is however, restricted to only one B-School students and factors such as admission test (CAT, GMAT, etc.) score, age, gender have been ignored.*

**Originality/value** – *The study is one of its kind which considers past academic performance from school level to under-graduate program to explain MBA performance. It is also a first study which compares the performance of students from a regular MBA program with that of a foreign collaborative*

*program. Therefore, the insights from our paper would provide valuable inputs in designing admission criterion and planning any collaborative program.*

*Keywords: Management Education, under-graduate degree, academic performance, regression analysis*

## **INTRODUCTION**

The Master of Business Administration (MBA) degree is one of the most sought-after qualifications in the world of Business and is often considered to be the “ticket to the executive suite” (Kelan and Jones, 2010). This is seen as one of the fast tracks to reach a leadership level in a corporate with fat packages which include perks and bonuses. Over last 100 years ever since Harvard Business School started its MBA course in 1908, there have been many reputed Institutes that provide high quality education in the world across North America, Europe and Asia. In India the number of Management Institutes and the number of students has proliferated over the years. As per the Associated Chambers of Commerce of India (ASSOCHAM) reports of 2016, around 200,000 students graduated from 5,000 management institutes in the year 2016-17. However, the biggest challenge is that, while the top institutes still hold some merit in the industry, majority of the fail to provide quality management education and as a result their graduates remain un-employable. (ASSOCHAM, 2016). On the contrary, majority of these business schools face the challenge of selecting the appropriate applicants, certify the quality of their education, and fulfill the promise of student expectations of getting jobs in their dream companies. These blue-chip companies (well-known and reputed in their areas of business Consulting, Consumer Products, Banking & financial Services, Hi-Tech etc..) go to selective B-School campuses for hiring based on the MBA performance of students. While we know that the performance of the students depends on the quality of education provided by these B-Schools, it cannot be ignored that the quality of the incoming students is also an important factor that impacts the performance. With the highly competitive activity between B-Schools to attract the best students, the admissions criteria become an important factor in predicting the MBA performance.

There have been many studies that have sought to examine the issue of the quality of incoming students and most studies have focused on the previous education performance in high school and UG Grades, demographic variables, entrance qualifying examinations like CAT, GMAT, MAT, XAT, and previous work experience. Many B-Schools have often used a mix of all the above criteria for the student selection process and some of the Top Indian B-Schools have in many cases specifically stated their preferences on one or more parameters. While some B-Schools have used work experience as one of the important qualifying parameters, others have used under-graduate specialization as a preferred choice. We do know that the most common under-graduate programs that are studied by students are

bachelor's degrees in, Arts, Science, Commerce, Business Administration and Engineering. Using UG specialization as a criterion comes from the general understanding that Science & Engineering graduates are more analytical and hence likely to be able to use management tools, techniques more effectively in problem solving situations. Similarly, students with Commerce and Economics background are likely to be more proficient in the field of Finance. While a lot of studies has been undertaken to study the various factors that impact the performance, there has been limited research done on the influence of the stream of undergraduate program which makes the objective of our study relevant. The purpose to study whether the previous degree matters for MBA performance is possibly the first of its kind in the Indian context. This study has been done at Universal Business School, Karjat near Mumbai in India, which is one of the premier, fast growing B-School. Universal Business School which was founded in 2009 by three Global CEO's and endorsed by 60 CEO's, offer various bachelor's and master's program in Business management providing both local accredited MBA programs as well MBA programs with Foreign Collaboration. However, while the entry criteria for both the master's program are the same, the course curriculum, pedagogy and assessments criteria has some differences.

We first review the findings of the prior research to confirm the student's previous performance as good indicators of their success in the MBA program in the Indian context. We then extend this literature by examining the influence of the stream of undergraduate program as an indicator for MBA performance. In this study we analyze data of two different MBA programs which made us undertake an additional study to see if there was any impact on the end results.

## LITERATURE REVIEW

It is a common belief that the admission criterion used for MBA admission capture the ability and the motivation of MBA aspirants. There are numerous studies which have been conducted to examine the admission criteria that are likely to influence the performance of the students in their MBA program. One of the earliest studies on this topic was done by Deckro and Woudenberg in 1977, where they studied GMAT scores and undergraduate GPA's to predict the success of the MBA performance. The study concluded that these two factors were important factors. (Deckro and Woudenberg, 1977). Carver and King (1994) studies also reported that several MBA schools base their admissions on some combination of their Undergraduate GPA's and GMAT scores. They also found that GMAT was a better predictor of performance than undergraduate GPA. However, although a number of studies analyzed the relationship between MBA student performance and these variables, some these studies found inconclusive and conflicting results. One study done by Hecht and Powers (1982) reported multiple correlations between undergraduate GPA and GMAT for first-year MBA students that

ranged from .12 to .67. In another study by Ahmadi, Raiszadeh, and Helms (1997) found that undergraduate GPA explained more than 27% of the variability in graduate GPA, whereas GMAT scores explained 18%. Zwick (1993) studied 90 schools in the United States and Canada to investigate the validity of the GMAT for the prediction of grades in doctoral study in business and management. Zwick found that undergraduate GPA alone tended to be a more accurate predictor than GMAT Verbal and GMAT Quantitative together. Talento *et al.* (2008) also showed that GMAT is one of the best factors to predict MBA success.

In fact, some researchers went a step ahead to investigate whether undergraduate pre-requisite courses like marketing, economics, accounting, etc. predicted MBA performance (Christensen *et al.*, 2012). Many other researchers such as Anderson, Benjamin, & Fuss (1994); Borde (1998); Cheung & Kan (2002); Durden & Ellis (1995); Ekpenyong (2000) have found support for this notion. In particular, Ely and Hittle (1990) showed completed accounting courses were significantly correlated with performance in graduate business studies. Additionally, Anderson and colleagues as well as Didia and Hasnat (1998) found students who had taken calculus and other mathematics courses performed better in economics and finance courses than students without such background. Though researchers studied impact of certain subjects on the MBA performance, there is no possible evidence in research to examine in detail what specializations will impact the performance.

Researchers have also sought to examine other variables that influence the MBA performance like demographic variables (education, income, age, marital status), social (student-classmate relationships, student-lecturer relationships), individual (work experience, skills) and organizational (location, work atmosphere, technology facilities). Quite a few standalone reputed institutions have also done studies in this area and one such study was conducted by Institution of Business Economics of Istanbul University where demographic, social, individual and organizational factors related data was collected through a survey method (Cigdem and Mustafa, 2013). In this study researchers used the Categorical Regression Analysis as the statistical method and found that two demographic factors, age and marital status influenced the MBA performance significantly.

Some researchers explored age as an explanatory factor in graduate GPA performance. Peiperl and Trevelyan (1997) found age to have predictive value. They discovered a negative correlation between age and MBA performance with younger students performing better than older students. One explanation for this result may be the fact that younger students have more recent experience with academic environments and thereby are better primed for graduate study. However, Graham (1991) and Paolillo (1982) found age not to be significantly correlated with MBA performance. Finally, Braunstein (2006) compared business and nonbusiness undergraduates and found age and work experience to be more significant than GMAT for nonbusiness degree MBA applicants. In another

study, a team of researchers predicted the MBA performance of applicants at Stanford University School of Business, one of the top 10 rated B-Schools in the world. (Srinivasan *et al.*, 2017). They applied multiple regression methods on the past applicant information thus aiding the selection process at Stanford where thousands of applications are received every year. Similarly, a predictive model using multiple regression by Yang & Lu (2001), showed that undergraduate grade point average and scores on the Graduate Management Admissions Test had significant impact on MBA performance. A detailed literature review of studies published from January 1990 to December 2013 on the academic performance of students or graduates of MBA programs was conducted by Silvana *et al.* (2016), The review results showed that most researchers studied relations between the entrance test GMAT (Graduate Management Admission Test) and UGPA (Undergraduate Grade Point Average) as predictors of GGPA (Graduate Grade Point Average). Adams and Hancock (2000) also found the number of years of work experience between the undergraduate degree and MBA functioned as a good predictor of MBA success. However, Dreher and Ryan (2000, 2002, 2004); Dugan, Grady, Payn, Baydar, and Johnson (1996); Graham (1991); and Peiperl and Trevelyan (1997) all concluded that work experience was not correlated with graduate GPA. Surendran and Monisha (2017) study done at National Institute of Technology, Trichi, India considered variables like Age, Gender, High School grades, UG grades, Common Admission Test (CAT) percentile and Work experience and used Logarithmic Regression to predict the MBA performance of 64 students. Their study results indicated that Work experience was the most influencing factor and the high school grades were the least influencing factors for MBA performance.

Researchers like Krambia-Kapardis & Zopiatis (2008) have taken the research to another dimension by considering whether there is a balance between “head” and “heart”. Based on the survey of 1000 students in Cyprus they found that factors like honesty, loyalty to family and friends, friendliness, self-confidence and world peace are ranked as the five most important personal values for college students. Similarly, Damnjanovic *et. al.* (2020) explored the extracurricular activities such as mentoring top talented students for international business case competitions on performance. This according to authors, provides the opportunity for the development of phonetic skills, knowledge and leadership potential of under-graduates and has a positive impact on students' overall development.

In lieu of the limited studies to examine the influence of the Undergraduate specialization on the student MBA performance, we embarked on this study. There was also very limited study on the impact of High School grades which is another criterion that has been analyzed in this study.

## **RESEARCH OBJECTIVE AND METHODOLOGY**

The key research objectives of the study are:

- i. To understand the influence of high school academic performance on the academic performance during Post-Graduate Management education.
- ii. To understand the influence of various streams of under-graduate academic performance on the academic performance during Post-Graduate Management education.
- iii. Any marked difference between the performance of students in regular MBA program and foreign collaborative MBA program

Therefore, based on the objective of the study our hypothesizes to be tested are as follows:

### **Hypothesis 1**

H<sub>0</sub>: There is no difference in performance of students between regular MBA and foreign collaborative MBA.

H<sub>1</sub>: There is a difference in performance students between regular MBA and foreign collaborative MBA.

### **Hypothesis 2**

H<sub>0</sub>: There is no association between the various streams of Under -Graduate program and performance in the Post-Graduate Management education.

H<sub>1</sub>: There is an association between the various streams of Under -Graduate program and performance in the Post-Graduate Management education.

### **Hypothesis 3**

H<sub>0</sub>: There is no impact of past performance on MBA performance.

H<sub>1</sub>: There is an impact of past performance on MBA performance.

**Considering the objectives of the study and the hypothesis framed, we have collected related to academic performance for all students of both the regular MBA and foreign collaborative MBA program from Universal Business School, Mumbai. The data collected include grades of students from 10<sup>th</sup>, 12<sup>th</sup>, undergraduate and post graduate level for batched of two academic year (2017- 19 and 2018-20).**

We use two-sample t-test to test the first hypothesis, which is to identify if there is any significant difference in the mean performance (both past and present) of students enrolled for the regular MBA program and the foreign MBA program. The analysis of the second and third hypothesis is done based on the theoretical framework provided by Holton (1996), which proposes a causal relationship among motivational elements, environmental elements, ability or enabling elements and outcomes. Holton suggested that individual performance is a function of learning outcome, which, in turn, is influenced by motivation to learn and individual ability. However, unlike Holton's model our focus is primarily on the "ability" aspect of the students, assuming the they are motivated enough for the

course and the institute provides them the conducive environment for effective learning and outcome. We use the past performance of the MBA graduates to evaluate their ability to perform in the MBA program. For the purpose of our analysis, we use a multivariate regression model, where the final MBA grades is the dependent variable while the grades at 10<sup>th</sup>, 12<sup>th</sup> and undergraduate level along with the undergraduate degree as the dependent variable. The graduation degree is captured using dummy variable. We assume that business related degrees (BBA and BCom) are the most suitable graduate degree for MBA. So, we treat these two degrees as the base. Remaining degrees are grouped as Technical degree (BE and BCA) and Others (BA and BSc). Apart from these, we also use two control variables, the batch year and batch type. We use a year dummy to differentiate the 2017-19 from 2018-20 batch and another dummy for MBA program to differentiate the foreign collaborative MBA with regular MBA. The results of our analysis are discussed in the following section.

## ANALYSIS AND RESULTS

We have collected data of 254 from two consecutive batches of both regular and foreign collaborative program. The detailed breakup of students is provided in the following table 1 while the descriptive statistics of 254 students are provided in table 2. The descriptive statistics suggest that on an average, score for the sample students have a downward trend. The highest is for the 10<sup>th</sup> standard while lowest for MBA. Moreover, the variation has also gone down, lowest for MBA scores. Students performance is more consistent at the MBA despite having higher variability in performance in lower classes. However, this consistency would have been better if the grades for MBA would have improved.

Table 1. Details of Students

|                 | Regular MBA | Foreign Collaborative MBA |
|-----------------|-------------|---------------------------|
| 2017 – 19 Batch | 59          | 57                        |
| 2018 – 20 Batch | 70          | 68                        |
| TOTAL           | 129         | 125                       |

Source: Compiled by authors.

Table 2. Descriptive Statistics

| Variable         | Obs | Mean    | Std. Dev. | Min     | Max     |
|------------------|-----|---------|-----------|---------|---------|
| 10th Score       | 254 | 75.469  | 11.1916   | 7.8     | 97      |
| 12th Score       | 254 | 73.472  | 11.0493   | 48.54   | 95.4    |
| Graduation Score | 254 | 65.5472 | 8.5984    | 7       | 85      |
| MBA Score        | 254 | 63.0835 | 6.19461   | 45.0923 | 79.5864 |

Source: Compiled by authors.

In order to answer our first hypothesis, we use a two-sample t-test. The results of the test are provided in table 3.

Table 3: Results of t-test

| ITEM                          | Foreign MBA |       |      | Regular MBA |       |      | T-test |
|-------------------------------|-------------|-------|------|-------------|-------|------|--------|
|                               | No of Obs   | Mean  | SD   | No. of Obs  | Mean  | SD   |        |
| Final MBA Score               | 125         | 61.41 | 6.01 | 129         | 64.71 | 5.94 | 0.0000 |
| Final MBA Score (17-19 batch) | 57          | 60.09 | 6.18 | 59          | 63.27 | 5.36 | 0.0019 |
| Final MBA Score (18-20 batch) | 68          | 62.51 | 5.69 | 70          | 65.92 | 6.19 | 0.0005 |

Source: Computed by authors

The results suggest that there is statistically significant difference in performance for the 2017-19 and 2018-20 batches individually as well as both the batches taken together. The performance in Regular MBA (RMBA) program is better compared to the Foreign MBA program. A possible reason for the difference may be that the foreign collaborative MBA exams are more assignment oriented as compared to the regular MBA exam. As students in the Indian undergraduate system are not used to assignment-based assessments, the average performance is likely to lower, however further research will be required to validate the same. In order to have better clarity, we proceed to the results of the regression model. The results of the regression model are presented in table 4.

We have used two regression models in our analysis. In the first model, we consider only the type of graduation degree and the graduation score apart from the control variables. While in the second model, we include the 10<sup>th</sup> and 12<sup>th</sup> scores apart from the other variables as used in Model 1. As expected, the R-square value for Model 2 is higher than Model 1 because of more explanatory variables. However, the R-square value in both the models are relatively low. Only 11.39% and 25.66% of the variability in Final MBA score (dependent variable) is explained by the independent variables. The results do confirm that past performance positively influences the final MBA performance. The coefficients of the graduation, 12<sup>th</sup> and 10<sup>th</sup> scores are statistically significant in both the models. The coefficients of the dummy variables (d\_tech and d\_others) suggest that technical students' performance is lower compared to undergraduate business (BBA and B. Com) students. While, the other undergraduate students (BSc and BA) perform better than business students. However, the coefficients, in both the models, turn out to be insignificant. So, we have to conclude that the graduation degree is immaterial.

Table 4: Results of regression model

|                        | Model 1       |  | Model 2      |
|------------------------|---------------|--|--------------|

These results of the regression analysis are in line with the findings of Yang & Lu (2001) and Silvana *et al.* (2016), whereby the undergraduate academic performance is an important predictor for the graduate academic performance. In fact, all the previous academic performance (10th, 12th and under-graduation) turned out to be significant, confirming the claim that past performance of student is important. However, our objective of trying to determine the best undergraduate degree for an MBA program remains inconclusive. Alternatively, the regression results suggest that the final performance depends a lot on how well student study or absorb the MBA learning, irrespective of whether they come from business stream or technical stream.

A major limitation of the study is that we do not consider other information about the students, such as age, gender, and prior work experience. An inclusion of these factors could have, definitely, improved, the predictive ability of the regression models.

## CONCLUSION & IMPLICATIONS

Our study on the MBA students' academic performance throughs out a number of interesting observations. The results of the regression model with respect to the past performance and its impact on MBA performance is consistent with the existing literature. Ahmadi, Raiszadeh, & Helms (1997) and Yang & Lu (2001) have noted undergraduate performance positively influences MBA performance. We have extended this argument to include the school level and high-school level performance, which has never been considered before. Our findings suggest that past academics at all levels does matter. Moreover, the fact that about one forth of the variation in MBA performance is explained by our regression model (model 2) is really encouraging.

Researchers such as Anderson, Benjamin, & Fuss (1994), Durden & Ellis (1995), Borde (1998), Cheung & Kan (2002); Ekpenyong (2000) and Christensen et al., (2012) have found that the specific knowledge

in a particular stream does have an impact on MBA performance. However, in our analysis we do not find such evidence. Both these findings have serious implication for admission process. MBA institutes should focus on the quality of intake by admitting students with consistent past performance. We also notice that student's performance is more consistent at the MBA despite having higher variability in performance in lower classes. There is also statistically significant difference in performance between the 2017-19 and 2018-20 batches for both regular MBA and foreign collaborative MBA. Moreover, the performance in Regular MBA program is better compared to the Foreign MBA program. These set of findings suggest the importance of quality in program delivery.

Other factors such as GMAT scores (Zwick, 1993; Talento et al., 2008), age (Peiperl and Trevelyan, 1997; Cigdem and Mustafa, 2013) work experience, skills (Cigdem and Mustafa, 2013) human values honesty, loyalty (Krambia-Kapardis & Zopiatis, 2008) extracurricular activities (Damnjanovic et. al., 2020) have also being explored. Including such factors in future studies may provide valuable insights. Our finding is, therefore, limited by the exclusion of the above-mentioned factors. Moreover, the study is based on data from one MBA institute and warrant caution in the interpretation of results.

We finally conclude that addressing the factors as identified in our study would not only help address improve the academic quality of MBA graduates but will make them more employable, thereby benefitting the corporate sector, economy and the society at large.

## **FUTURE RESEARCH**

Some of the limitations mentioned above could potentially be examined in our future studies. Similar to the GMAT used by International B-Schools, in the Indian context the main qualifying exams are Common Admission Test (CAT), Management Aptitude test (MAT), which could be used as criteria to check the influence on the performance. However, given our end objective was MBA performance, one could potentially evaluate if the pedagogy could be one of the critical influencing factors. Especially with the education industry impacted by the pedagogic disruption (Synchronous Online learning) in lieu of Covid-19, it may be interesting to check the impact on the performance of the current batches of students.

### ABSTRACT

Voluntary simplicity (VS) is a lifestyle characterised by consumption reduction, sustainability and a focus on intrinsic values. There is a dearth of studies about this consumption profile, its motivations and its characteristics, in particular about consumers who are taking steps towards voluntary life simplification: the beginner voluntary simplifiers (BVS). This study focuses on this segment and tries to understand the values, motivations and the meanings of consumption, with the aim to better understand the process of change and the outcomes of this lifestyle.

This article presents narratives of consumers in the initial stage of VS exploring their consumption behaviour through in-depth interviews and a focus group. The results shed some light on the consumption patterns of this BVS group and their perceptions about the lifestyle transformation. Findings highlight multiple manifestations of voluntary simplicity, as well as obstacles to adopting sustainable consumption and indicate practices to overcome such barriers. Implications and suggestions for future research are discussed.

*Keywords: Voluntary simplicity; Beginner voluntary simplifiers; Consumption Behaviour; Exploratory Study.*

### INTRODUCTION

Overconsumption and unsustainable lifestyles are social issues which point to the necessity of environmentally conscious and responsible choices. Some consumer groups avoid high materialistic profiles and actively engage in exploring options to simplify their lifestyles, as is the case with the voluntary simplifiers.

Interest for voluntary simplicity (VS) and related trends, such as minimalism, is attracting increasing attention from the popular press, media and academia. There is a growing body of literature on consumers that are voluntarily changing their habits of consumption, downsizing the amount of products purchased and who want to lead a more balanced life (Markowitz and Bowerman, 2011, Huneke, 2005, Ballantine and Creery, 2010, Peyer et al., 2017, Walther and Sandlin, 2013). Researching

VS is important for a better understanding of consumer behaviour in contemporary consumer cultures (Alexander and Ussher, 2012) and drawing implications for increasing sustainable consumption (McDonald et al., 2006, Peyer et al., 2017, Brown and Kasser, 2005).

The decision of voluntarily reducing consumption allows consumers to control how they adopt this lifestyle (Kronenberg and Iida, 2011). Indeed, the voluntary nature is a central aspect of this lifestyle, leading to different meanings for similar consumption reduction behaviours. In certain instances, individuals adopt VS fully in multiple aspects of their daily lives. However, there are different levels of engagement, with some consumers partially adopting this lifestyle, embracing some practices and not others. Understanding the different degrees of VS is important for the advancement of knowledge about sustainable consumption practices (McDonald et al., 2006, Shaw and Moraes, 2009, Brown and Kasser, 2005). This research focuses on consumers who partially adhere to VS, departing from the profile of indifference to the 'beginner' profile of this lifestyle.

We report an exploratory study consisting of in-depth interviews and a focus group of beginner voluntary simplifiers (BVS), with the aim to understand people who are in the process of adopting conscious consumption through materialism reduction and simple life oriented-behaviour. Although these simplifying efforts may occur at a small and individual scale, they are useful approaches to develop a sustainability ethos. VS has been object of a growing body of research, however fewer studies focus on BVS. Our literature review highlighted the need for further investigation into the process leading to life simplification through consumption. Hence, this study's main research question is: What values, motivations, meanings and outcomes lead consumers to become BVS? This research intends to answer this question and understand what motivates one to take steps towards consumption reduction and life simplification. This may have important implications for research, companies and public policy as the concept of BVS can make VS more perceptible and more marketable (Oates et al., 2008).

## **VOLUNTARY SIMPLICITY: MAIN CHARACTERISTICS AND LEVELS OF ENGAGEMENT**

VS has been described as a low consumption lifestyle that can have a positive impact on life satisfaction and the perception of happiness (Alexander and Ussher, 2012, Huneke, 2005, Boujbel and d'Astous, 2012, Brown and Kasser, 2005). Elgin and Mitchell (1977) listed five VS core values: material simplicity; human scale; self-determination; ecological awareness; and personal growth. According to Craig-Lees and Hill (2002), voluntary simplifiers reduce consumption because of three primary motivations: environmental, spiritual, or self-oriented causes. These authors suggest that future studies need to investigate the different underlying drivers of the simple lifestyle choices. Environmental consciousness is considered a common motivation for this lifestyle, however, other aspects cannot be

ignored when studying simple life as consumption reduction or a search for the reduction of stress (Rich et al., 2017). Personal dimensions, benefits and self-quality of life are common motivations for voluntary simplifiers that need to be more fully studied (Marchand and Walker, 2008).

Among the 'non-simplifiers' and the radical profile of voluntary simplifiers, there are different degrees and natures of engagement (Bekin et al., 2005, Etzioni, 2004). Elgin and Mitchell (1977) present four categories of voluntary simplifiers: Full Voluntary Simplifiers; Partial Voluntary Simplifiers; Sympathizers; and the Indifferent or Opposed to Voluntary Simplicity. Etzioni (2004) classifies simplifiers into three levels: the downshifter; the strong simplifier; and the holistic simplifier. Huneke (2005) distinguishes between the highly and the less committed simplifiers through consistency in some practices that require ongoing effort.

McDonald et al. (2006) analysed previous categorizations in the field and suggested unifying the plurality of levels and denominations with a new concept: Beginner Voluntary Simplifiers (BVS). For these authors, Non-Voluntary Simplifiers (NVS) is the group that are not interested in sustainable or low consumption practices; Voluntary Simplifiers are those who are deeply engaged in the philosophy of responsible consumption and minimal practices. The BVS is a target group that may adopt some practices of VS but they are not radical. The three groups are interpreted as fluid, with the possibility of movement among them (McDonald et al., 2006). Research about BVS is relevant to know more about the process of adopting conscious consumption (McDonald et al., 2006). Sandlin and Waither (2009) and Gambrel and Cafaro (2010) found in their research that the moral identity development of simplifiers was an 'ongoing process'. BVS may not become full voluntary simplifiers in the future, it does not refer exclusively to a phase, it is a category that has its own particularities and may not advance to radical profiles (McDonald et al., 2006).

The BVS is a group of consumers that try to analyse market systems to find ethical alternatives (Shaw and Moraes, 2009, Peyer et al., 2017). Marketing professionals and companies need to understand the consumption behaviour of BVS to reach this audience with consistent products and services, ensuring companies have more coherent, environmental and socially conscious practices. This study explores the consumption behaviour of BVS in the facets of the process of changing behaviour; motivations, values, meanings and outcomes of life simplification.

## **METHODOLOGY**

This research aims to understand the values, motivations and meanings for taking steps towards simplifying consumption. We have conducted an exploratory study consisting of two qualitative data collection methods: (1) in-depth interviews; and (2) a focus group.

An in-depth study of the motivations, values, meanings and marketing outcomes behind consumption is important in order to develop knowledge about this field and its challenges. In-depth interviews with a flexible and adaptive way of questioning, to provide free will of the participants. Through contact with the participants, they were encouraged to describe experiences, trying to develop a conversation and to emphasise narratives. McDonald et al. (2006) suggest in-depth interviews to research the BVS. As far as the focus group is concerned, it is applied to understand how interviewees perceive a situation, it is a dynamic meeting where participants are encouraged to discuss specific topics they have in common in their lives (Parker and Tritter, 2006). This method was chosen to complement the individual interviews because the inter-relational dynamics of participants enriched the findings with discussions about VS.

Regarding the operationalisation of the concept of BVS, they were identified by self-categorization (Brown and Kasser, 2005, Cherrier, 2009, Huneke, 2005, Alexander and Ussher, 2012, Sandlin and Waither, 2009, Walther and Sandlin, 2013, Zamwel et al., 2014). The interviewees had some motivations and goals for simplifying life, but they identify themselves as someone who adheres to the VS in an initial or partial way. Nineteen BVS aged between 21 and 68 years old were interviewed. The focus group had 8 BVS female participants between 24 and 35 years old and the meeting lasted seventy minutes. Homogeneity was observed during participant recruitment to facilitate communication and sharing of opinions (Parker and Tritter, 2006). The group interaction highlighted participant perceptions about challenges, common motivations and practices in VS.

The collected data were transcribed and carefully systematised into categories in order to identify plural aspects behind the BVS consumption behaviour. Content analysis was used to reduce and structure data with the development of thematic categories and the identification of relationships (Malhotra et al., 2012).

## **FINDINGS AND DISCUSSION**

### *Motivations*

This BVS group presented multiple motivations for simplifying life, that were organized into two groups: The enablers are helpful drivers to engage in this lifestyle, while the barriers are obstacles, i.e. constraints that limit the adoption of simple life, cited as a response to why they did not consistently adhere to some responsible practices.

Among the enablers, spiritual motives were cited as important reasons. Life satisfaction and the motivation of decluttering life are also positive causes to engage in simple life. These findings are in line with Huneke (2005) and Alexander and Ussher (2012). Respondents associate VS with a happy life with fewer problems. Victor noted,

*I don't try to simplify my consumption because it is more economical, it's simply because I feel that this simple way of living is what satisfies me. Simple living satisfies me*

Coherence, self-control, conscious choices (Huneke, 2005) and more self-reliance are positive aspects that motivate them to VS. Rejecting the consumption logic and the status derived from high materialism have also been mentioned as enablers to VS. Social reasons were the most cited drivers, as the motivation to help people in need and the intention to share possessions with others; environmental reasons are also important causes to engage in VS. Economic reasons were less cited as the impulse for simple life.

Barriers identified by respondents restrict involvement in VS practices. Regarding perceptions about brands, mistrust is cited as a common difficulty, as there are doubts whether the promoted practices are truthful. Interviewees reported inconsistent behaviors, as a kind of confession about their incoherent practices and the inconstancy of this lifestyle. Some of the respondents feel guilty when talking about these barriers; others just justify these negative motivations and do not intend to make further progress in this lifestyle.

Convenience is an important aspect that makes them neglect some ethical practices. They also reported impulsive buying behavior and unawareness about relevant issues. Aligned with these findings, McDonald et al. (2006) talk about a 'tension' between the practice of reducing consumption and the marketing opportunities related to this public. Huneke (2005) concluded that BVS did not report such high levels of consistency and undertook fewer activities, affirming that consistency was a distinguishing aspect between more and less highly committed simplifiers.

Interviewees assume that adopting conscious consumption is complex and difficult to balance with the lack of time in daily life, and with the lack of information about products around them. These findings are in line with Huneke (2005) and Alexander and Ussher (2012). Respondents express their interest in knowing more about the production process and the human resources of companies. High prices of sustainable products are cited as barriers to a full engagement in VS and presented as a disadvantage of some sustainable and ethical brands. These aspects are used to justify some incoherent practices in daily life, as Maria noted:

*I do not know very much about brands that respect the environment, that do not conduct animal experiments, they must promote more ethical practices. And, of course, some of these brands charge high prices, so it is difficult to acquire their products.*

Some marketing strategies, such as the richness of options, aesthetic attributes and the supply of new models, are temptations to acquire more products. Respondents also emphasize social aspects as barriers: the judgment of others, social patterns and the relationship with people with different lifestyles.

These results are aligned with the classification of VS motivations by Craig-Lees and Hill (2002), namely environmental, spiritual and self-oriented forms. Among the enablers, the environmental motivations include consciousness, environmental reasons and the rejection of the consumption logic; the spiritual group of motives includes some religious causes, social reasons, social status rejection and the search for coherence; while the self-oriented ones embrace life satisfaction, decluttering life, self-control, and economic reasons. We can observe divergent drivers that position this group within conflicting motivations, such as rejecting social status versus social influence; or rejecting consumption logic versus consumption temptations.

### *Values*

This topic presents categories that these BVS have regarded as valuable in VS. A balanced living, striving for a simple life without excesses seems to be important to respondents, as mentioned by Huneke (2005), with some consciousness, self-control, contradictions and concessions. They also value a work-life balance (Bekin et al., 2005), and the equilibrium between their individual styles and the consideration of the local community (Shaw and Moraes, 2009).

Low materialism, material simplicity and minimalism are important values for the interviewed BVS, which is in alignment with some VS studies (Huneke, 2005, Etzioni, 2004, McDonald et al., 2006, Kraisornsuthasinee and Swierczek, 2018, Balsa-Budai et al., 2019, Elgin and Mitchell, 1977). They value fewer possessions, associating this with wellbeing and lightness. Owning less (Shaw and Newholm, 2002) is a consequence of the consumption reduction of this BVS group. Respondents also value detachment from material things and social status detachment, seeking some distance from a consumerist society, and expressing their resistance to consumption culture.

Some emotional attributes are emphasized when talking about values, the objects that they decide to keep have great importance in their life and history. This finding shows that there is a closeness and a distance from material possessions in VS, as mentioned by Marchand and Walker (2008). These meaningful possessions do not necessarily have high value to other people, they are commonly associated to old things, handmade articles or special gifts. Experiences in daily life (Huneke, 2005) are also valuable for the interviewees, they often contrast this value with materialism, emphasizing that they now have more time for good experiences with a family-oriented life (Craig-Lees and Hill, 2002), instead of spending time looking for new products in sites and stores.

Some aesthetic values were cited associating VS with simple designs, order and harmony, with the visual aspect featuring in multiple facets of their lifestyle. Respondents also value durability, functionality and quality (Alexander and Ussher, 2012). A preference for quality over quantity was reported (Feola, 2014).

*First, I check if the object is really necessary and important to my routine; then there is a question of price, if it fits the budget. I also do not value the cheapest, because I also value quality, I usually say that we buy neither the most expensive nor the cheapest, we try to stay in the middle. I also wonder if it's something I'll need for a long time ... it must be of good quality. And lastly, there is the aesthetic issue. The aesthetic issue is also very important, since my possessions are related to the expression of my personality ... (Marcela)*

Social and environmental aspects are important in the decision process of respondents, such as the appreciation for the sharing economy and fair trade. Regarding perceptions about brands, the BVS group demonstrated indifference, reporting that signalling social status through brands is not important for them, unless these companies represent similar values to their own lifestyles. They also emphasize transparency when talking about brands, valuing the clear connection between company actions and the communication of these practices. Social responsibility is related with a sense of community (Huneke, 2005); with relatedness, connecting with people and community (Rich et al., 2017, Kasser, 2009); and morality (Kraisornsuthasinee and Swierczek, 2018). The environmental values are associated with the concern for animal welfare and resource scarcity (Moisander and Pesonen, 2002, Elgin and Mitchell, 1977, McGouran and Prothero, 2016, Kraisornsuthasinee and Swierczek, 2018). They report concerns about product disposal since the amount of waste produced is a concern for them. Participants also lay emphasis on the local economy (Rich et al., 2019), giving preference to food produced nearby and by small businesses. They seem to place more confidence in this kind of business. Shaw and Newholm (2002) found that Voluntary Simplifiers drive their consumption choices by strong internal values. Analysing the BVS values, some of them are neither that strong, nor internal values, which is aligned with the more superficial and initial profile of responsible consumption of this group. Some values are dependent on others, fair prices are sometimes cited as a condition to conscious consumption; emotional attributes are more important than low materialism.

#### *Meanings and Associations*

This lifestyle is associated with personal satisfaction, happiness, peace, calm and order. The lack of peace is linked with respondents' previous materialistic behavior. The personal space to enjoy life, lightness and easiness are also linked with simple life.

*I think a simple life is easier, happier... people worry about accumulating things, worry about having. In a simple life, one is not so concerned about having, one lives more lightly. (Clara)*

Freedom, autonomy and identity are closely related to the meaning of simple life. The consumption profile is associated with individual identities. The studies of Ferreira and Scaraboto (2016) and Shrum et al. (2013) present similar associations. Shrum et al. (2013) argue that materialism is an aspect of identity; it is about the acquisition and the use of things, services, experiences and relationships to provide symbolic value.

Sandlin and Waither (2009) found that the moral identity of VS is a continuous and a complex learning process, having self-practices and self-regulation, and with an individualized approach to personal moral development. Personal growth has an important meaning for some BVS that associate a simple life with individual, moral or spiritual development. Humanity is also an essential association to BVS, all of them emphasized human values and social responsibility when talking about VS. The focus on experiences and relationships is also part of this humanity association. For BVS, belonging to a particular group is an important aspect of simple living. Some of them are aware of the image their lifestyle conveys to others and do not want to come across as superfluous or ostensive, they want to belong to groups that are distant from a luxury lifestyle and conspicuous consumption.

Self-control, consciousness, coherence and focus are interrelated aspects commonly associated with VS. Simple living involves thoughtful consumption (Kronenberg and Iida, 2011), the capacity to reflect about purchases is closely related to conscious consumption and to the voluntary aspect of this lifestyle. Visual harmony is linked to simple life, associating some visual characteristics with broader aspects, as emotions, energy, personality and order in plural contexts of life. "Less is more" is the most popular association regarding this BVS group. They associate this concept with different contexts: the frequency of new purchases; the objects they already own; the visual aspect of the products they choose to buy; and with the aesthetic they prefer regarding architecture, art or their personal image.

#### *Marketing Outcomes*

The following analysis is about the practical consequences of the partial engagement in VS, such as product preferences and general consumption habits. With regard to product preferences, interviewees mentioned they leaned towards second-hand products, as stated by Shaw and Newholm (2002). They pointed out the sustainable and economic advantages of this practice. They also emphasized purchasing quality and useful products, instead of luxury and ostentatious ones. Interviewees talk enthusiastically about sustainable products, sharing positive consumption experiences they had.

Respondents generally prefer simple designs and casual products, with the intention of not being associated with luxury consumers or with some wealthy social status. While they may pay for better options, they prefer products and services that are not so distinctive, with the intention of not being part of a culture of ostentation and being able to spend their money on more meaningful experiences.

When participants talked about simplifying consumption, all of them exemplified with clothing. This is similar to the study of Alexander and Ussher (2012). Clothing seems to be relevant to their consumption profile and to communicate their identity. The fast-changing nature of fashion has been considered incoherent and not welcome for this consumer group. Research participants demonstrated particular interest for timeless and durable clothes that can be adequate to multiple occasions and stay

in good condition for several years. The timeless aspect is commonly associated with aesthetics characteristics, including a preference for simple lines, neutral colours and discrete details.

All respondents talked about the habit of reflecting before purchasing, they already have - or are in the process of - acquiring some control over consumption choices, with conscious decisions that take some time and patience when evaluating options. Many studies about VS emphasize reflection (Shaw and Moraes, 2009, Gambrel and Cafaro, 2010, Marchand and Walker, 2008, Kasser, 2009, Rich et al., 2017, Williams and Poehlman, 2017). Sara, a young architect, stated:

*Before changing my lifestyle, I didn't think about consumption. I wanted something and just went shopping for it, do you understand? Nowadays I stop and think, I reflect once, twice, three times if I really need that thing, then, if it is really indispensable, I'll buy it.*

Some respondents referred to avoidance of sales, they do not buy just because of the promotions, there must be other motives to purchase. Consumption reduction is a very common practice among the interviewees, they try to reduce shopping visits (Huneke, 2005), rejecting the habit of thinking often about consumption needs. They try to use their possessions frequently, even though it does not come easily.

*I do not buy so much stuff anymore, first of all, because there is no need to visit malls and stores often just to pass the time... I also do not buy fashion magazines, they just end up occupying more space... I do not think about what to consume all the time. Our society is obsessed with these thoughts, what to consume all the time. (Olívia)*

Sorting the waste and recycling are cited by BVS as common daily practices. Making frequent donations of products is also a habit reported by this BVS group. It happens when they buy new things or receive gifts. This disposal practice is commonly related with a social intention and as a solution for the issue of accumulation of possessions. According to Etzioni (2004), when people are positively motivated with no-materialistic values, they are more inclined to share their excess resources. The act of disposal for voluntary simplifiers can be seen as a form of empowerment, contributing to the circulation of the material (Cherrier, 2009). Respondents consider the sharing economy as a possible solution for materialism issues.

## IMPLICATIONS AND CONCLUSIONS

This research intends to contribute to understanding the motivations, meanings, outcomes and values of the group between the NVS and full voluntary simplifiers, shedding some light on the factors that trigger the adoption of VS. Despite the growth of studies about holistic simplifiers, it is important to focus on the behaviour of BVS (Ballantine and Creery, 2010, McDonald et al., 2006, Oates et al., 2008). Understanding BVS can help to know more about the process of engagement in the two other groups,

full voluntary simplifiers and NVS (Oates et al., 2008), acknowledging the call by McDonald et al. (2006) for further studies about the marketing implications of BVS.

The integration of different motivations and the complexity profile of VS may offer contributions to help on urgent issues of consumer behaviour, such as high materialism and irresponsible consumption. To the best of our knowledge, neither of these themes has been explored together in the context of the values, meanings, motivations and outcomes of BVS.

VS can be an avenue to understand antecedents and consequences of sustainable living (Rich et al., 2019). The results of this research shed some light on the perceptions and practices of BVS and suggest useful implications for research, companies and policy makers in the study and promotion of responsible consumption.

The BVS group presents several VS characteristics but some specific aspects may be useful to incentivize the process of changing consumption. Identifying the values and motivations related with reducing consumption can provide an understanding of consumers' preferences, particularly, the importance of balance. The symbolic associations regarding VS are important in the design of public policies to reduce high materialistic behavior; these meanings may be also relevant to understand the richness of symbolic associations around simple life. Some findings are sensations, concepts, feelings and goals, relating VS with personal, visual and social aspects.

Future research can focus on the effects of communication strategies to promote sustainable consumption and simple life. It would also be interesting to research the relationship between aesthetics and simple life in order to better understand the meanings and symbolisms around sustainable consumption. In terms of practical implications, the outcomes of this research may help managers to integrate some of the results observed with business strategies, given the increase in the number of consumers adopting VS (Markowitz and Bowerman, 2011, Huneke, 2005, Ballantine and Creery, 2010, Peyer et al., 2017, Walther and Sandlin, 2013). Companies need to achieve a better understanding of BVS in order to develop sustainable and durable products and the supply of services focused on this consumer's quality of life. This research area can encourage coherence and transparency in products and services, knowing that this may increase consumer loyalty and trust from BVS and related groups. Many business areas have shown a particular interest in VS, in order to tailor their services and products to this lifestyle through market segmentation, such as tourism (Kannisto, 2018) (Chieh-Wen et al., 2008), food and organic products, and fashion.

The association between VS, the search for well-being and the reduction of consumption and working hours may stimulate the development of corporate human resources policies to promote the work-life balance.

Qualitative analysis allows for a deeper immersion in the subjective aspects of the topic, enabling unique findings. But this approach also has limitations in terms of rationalization of data and the broad application of the conclusions. The small samples of in-depth interviews are also a limitation of this study considering that this research profile does not allow for generalizations. However, clarifying what the different typologies, motivations and behavioural patterns of BVS are may also be an important contribution of this study.

## WORKING CAPITAL MANAGEMENT AND FINANCIAL SUSTAINABILITY PERFORMANCE ANALYSIS IN SMES

Remondino, Marco<sup>1</sup>; Schiesari, Roberto<sup>2</sup>

<sup>1</sup>Department of Economics – DIEC, University of Genova, Italy

<sup>2</sup>Department of Management, University of Turin, Italy

### ABSTRACT

The idea of this research is to find out if the hypothesis about the impact of operating working capital management on business financial sustainability and, eventually, profitability is verified in the market of small and medium Italian companies. This analysis is empirical, being developed through a validation carried out directly on the data of the companies included in the sample. In order to give relevance to the data resulting from this process, 3,272 observations were collected, relating to 409 companies for a period of 8 years. The originality of this research lies both in the country taken as a reference (Italy), but also in the deepening of SMEs, since in most scientific papers about the topic, the focus is on a pool of listed companies. The methodology is based on the analysis of SMEs belonging to three production sectors. This was done in order to avoid that average data did not take account of specificities - something that would have reduced the possibility of producing comments - so to find a measure of synthesis for all the variables of working capital and the business cycle. A scoring mechanism has been created which, on the basis of the main indicators of working capital management, attributes a real evaluation to each company taken into consideration, for each of the years of the time horizon. The statistical correlation analyses are then carried out by comparing the score obtained and the main profitability indicators, i.e. ROA, ROI, ROS, ROE and an indicator of financial sustainability as PFN/EBITDA.

*Keywords: Operating working capital management; financial sustainability; profitability, Food industry, SME, Italy*

### 1. INTRODUCTION

Every decision taken within the company has an impact or at least a link with finance (Emmanuel, Otley and Merchant, 1990; Pike and Neale, 2006; Schaltegger and Burritt, 2017). The objective of this area therefore coincides with that of general management, i.e. maximization of value (Jensen, 2001; Yow and Sherris, 2008). To achieve this, three types of choices are made: investment,

financing and liquidity choices (Disatnik, Duchin and Schmidt, 2013), directly linked to economic and financial sustainability of an enterprise (Doane and MacGillivray, 2001).

The investment choices are related to the allocation of resources that the company owns and must be oriented towards activities and projects that can make the business sustainable and profitable (Hart and Milstein, 2003; Achtenhagen, Melin and Naldi, 2013). A distinction is made on the basis of the net present value, which must be positive, i.e. the expected return must be higher than the cost of capital employed. There is the following relationship: the riskier the projects are, the higher should be their yield (Lintner, 1975).

Financing decisions relate to raise the necessary funds for the company and have a direct impact on the financial structure. It must respect the level of risk of the projects to be financed, and their pay-back period while maximizing the value of the investments. Financing and investment choices are strictly related and, although different in nature, must be managed as a whole: the objectives of one activity must not prejudice those of the other. Finally, liquidity management determines how and how much money to mobilize on a daily basis and is commonly referred to "treasury management" (Kaiser, 2011), but even to "dividend decisions"

The finance function plays an intermediate role between the financial markets for raising funds and those for using them. On the basis of strategic planning decisions, it deals with how to meet the needs of funds for real activities, against which there are expected revenues with different deadlines and risk profiles. On a daily basis, there are other activities that fall within this area and are: guaranteeing an effective information system for financial control at the various management levels and optimizing the management of working capital by interacting with the other functions in the management of customer credit and supplier debt and stocks (Hofmann and Kotzab, 2010).

In fact, it is advisable to consider long-term financial decisions in the strategic planning phase, since an active collaboration is needed between executive and financial management, so to create a model for future development which is sustainable from the company's resources (Rauter, Jonker and Baumgartner, 2017). At the same time, in short-term choices, it is necessary that the financial plans and the staff who deal with them, work closely with those who lead the business, so as to ensure that the plans created in the strategic planning are actually consistent with the business situation (Nickols, 2016) and perspectives. In this regard, continuous monitoring and control of what is happening in the company is essential. One of the most useful elements when it comes to the finance function, both in terms of management and control, is working capital (Mathuva, 2015).

The basic idea of the present work is to research if the hypothesis about the impact of working capital management on business financial sustainability and profitability is verified, by analyzing small and medium Italian companies. The research is based on an empirical analysis, being developed

through a validation carried out directly on the data of the companies included in the sample (Remondino and Schiesari, 2019).

In order to give relevance to the data resulting from this process, 3,272 observations were collected, covering 409 enterprises over a period of 8 years.

This type of research was first carried out in 2003 by Marc Deloof (Deloof, 2003) on Belgian firms, but the outcome has been successful mainly in developing countries, gaining little space in the world of Western research. In fact, there are several studies relating to countries such as Pakistan (Raheman and Nasr, 2007), Malaysia (Darun, 2011), Nigeria (Falope and Ajilore, 2009), Jordan (ALShubiri, 2011), Iran (SAREMI, MOHAMMADI and NEZHAD, 2016) and others, there are only a handful of European or American scientific sources, relating to Greece (Lazaridis and Tryfonidis, 2006), Spain (Juan García-Teruel and Martínez-Solano, 2007), Sweden (Andersson and Blomdahl, 2017) and the United States (Cumbie and Donnellan, 2017).

In addition to the reference environment of the study, the originality of this research lies also in choosing SMEs for the analysis, a field investigated by a limited number of papers e.g. (Baños-Caballero, García-Teruel and Martínez-Solano, 2010; Afrifa and Tingbani, 2018), while in most other cases the focus was on a pool of listed companies.

The method also presents elements of differentiation, since it is based on the analysis of SMEs belonging to three specific production sectors. This was done in order to better compare the results of the analysis and to take into account the specificities affecting the level of circulation in different sectors. In (Hawawini, Viallet and Vora, 1986) the authors indicate that working capital behavior is industry dependent and even (Hill, Kelly and Highfield, 2010) consider the industry effect. An original scoring mechanism has thus been created which, on the basis of the main indicators of working capital management, attributes a real evaluation to each company taken into consideration, for each year of the time horizon. The statistical correlation analyses are then carried out by comparing the score obtained and the main profitability indicators, i.e. ROA, ROI, ROS, ROE and PFN/EBITDA.

The first part of the work is devoted to a theoretical in-depth overview of the concept of working capital and its optimization in strategic terms. The second part clarifies the objectives pursued in this research, going into more detail on the basic methods. The third part describes the of the analysis itself, with the deepening of the area of investigation and the choice of the time horizon. Consequently, the dynamics of SMEs in general and of the product sectors over the time horizon and the definition of the indicators taken into consideration are described. The last part consists of data collection and statistical analysis, description of the mechanism of scoring and correlation, followed by a synthetic recap of the results of the present research.

## 2. WORKING CAPITAL AND FINANCE

Net operating working capital (NWC) represents the difference between operating current assets and current liabilities (Yaari *et al.*, 2016).

This amount emerges from the reclassification of the Balance Sheet (Fiechter, 2011) with the criterion of management relevance and has, usually, a positive balance for industrial companies, since inventories and trade receivables generally have a greater amount than accounts payable .. The accounting rules state that an asset or liability is defined as current if it is converted into cash (in the case of assets) or paid (in the case of liabilities) within 12 months.

According to Deloof (2003), the way that working capital is managed has a significant impact on profitability of firms. Such results indicate that there is a certain level of working capital requirement, which potentially maximizes returns. Firms adopt working capital policies to address market imperfections over the operating cycle and incur costs and accrue benefits that affect cash flow and ultimately shareholder wealth (Hill, Kelly and Highfield, 2010)

A popular measure of working capital management is the cash conversion cycle, (CCC) that is, the time span between the expenditure for the purchases of raw materials and the collection of sales of finished goods.

Deloof [17] found that the longer the time lag, the larger the investment in working capital. A long cash conversion cycle might increase profitability because it leads to higher sales. However, corporate profitability might decrease with the cash conversion cycle, if the costs of higher investment in working capital rise faster than the benefits of holding more inventories and/or granting more trade credit to customers

Large inventory and generous trade credit policy may lead to high sales. The larger inventory also reduces the risk of a stock-out. Trade credit may stimulate sales because it allows a firm to access product quality before paying.

A substantial body of research examines individual components of operating working capital in isolation. In (Long, Malitz and Ravid, 1993) and in (Ng, Smith and Smith, 1999) the authors study trade credit policy and find support for the contracting cost motive with receivables used as a product quality indicator. In (Petersen and Rajan, 1997) they demonstrate that receivables are directly tied to profitability and capital market access

In (Shin and Soenen, 1998), the authors researched the relationship between working capital management and value creation for shareholders. They (Shin and Soenen, 1998) used net-trade cycle (NTC) as a measure of working capital management, basically equal to the cash conversion cycle (CCC), where all three components are expressed as a percentage of sales. They examined this relationship by using correlation and regression analysis, by industry, and working capital intensity.

They found a strong negative relationship between the length of the firm's net-trade cycle and its profitability. Based on the findings, they suggest that one possible way to create shareholder value is to reduce firm's NTC.

In (Juan García-Teruel and Martínez-Solano, 2007), the authors collected a panel of 8,872 small to medium-sized enterprises (SMEs) from Spain covering the period 1996 - 2002. They tested the effects of working capital management on SME profitability using the panel data methodology. The results, which are robust to the presence of endogeneity, demonstrated that managers could create value by reducing their inventories and the number of days for which their accounts are outstanding. Moreover, shortening the cash conversion cycle also improves the firm's profitability.

Companies are forced to increase flexibility and efficiency to build a competitive advantage. One of the main levers available to management has been to expand the range of services and products offered (Walters and Knee, 1989). This type of action has an impact in particular on two elements of the assets: credits and stocks, which have therefore grown in importance, to become two of the main components of the company management, not only for their weight in the balance sheet, but also for the strategic importance that they have acquired in this transformation.

If this focus on two components of working capital has influenced international competition since the 1970s, in the last fifteen years, with the spread of an increasingly global market, increased competitiveness and the effects of the economic crisis, these issues have become increasingly the subject of evaluation by all types of companies. In fact, an increasingly urgent need has emerged to control and plan the management of working capital in order to find the right balance between financial and operational choices. At a time like the present, when there are considerable problems for access to credit, it can be very difficult to combine the needs of the financial area with those of the operating area, in turn made problematic by competition and the need to maintain production at the level of quality required, without exceeding in stocks and regulating the delay in payments.

In addition to be an effective control tool, working capital is one of the most delicate elements of the finance function. The choices made with regard to working capital can be considered among the decisions of the financing mix, which have direct effects on the financial structure and, consequently, on the cost of debt and the level of financial risk perceived by the markets. In addition, negative elements linked to the overall profitability of the company may emerge from the management of working capital in the form of past due or uncollectible trade receivables, or losses linked to inventory obsolescence.

Operating NWC originates from the emergence of assets and liabilities in the business cycle (Enqvist, Graham and Nikkinen, 2014), with the additional variable of the loan in terms of delayed payment and higher costs incurred due to deferred receipts. The components influencing payment deferrals therefore have a decisive influence on the determination of the NWC. These include: the nature

of the activity carried out, the decision-making model, the organizational model and, finally, the information system.

As regards the nature of the activity carried out, reference is made to the differences that may arise on the basis of the type of technical-productive cycle and the conditions typical of the industry in which the company operates (Rizzoni, 1991). In some industries, in order to guarantee a certain level of service, it is necessary to keep an adequate variety and a considerable volume of products in one's own warehouse, while in others one is obliged to stock raw materials at specific times of the year due to the seasonal availability of the same. In both cases it is essential to have a large warehouse during most of the activity. The nature of the business, however, does not only affect the dynamics of stocks, but can also change the amount of receivables from customers, because to operate in certain sectors in which customers have a strong position with respect to the seller, it is appropriate to allow very long payment terms. In this way, the customer can finance himself, consequently the days granted become in this way a competitive factor and those who fail in this condition are likely to be replaced soon by other suppliers.

The Net Operational working capital is negatively associated with sales volatility. Increased sales volatility causes firms to reduce their net investment in operating working capital. Plausibly, the incremental cash flow provided by reducing the working capital gap is needed most by firms with volatile sales (Hill, Kelly and Highfield, 2010).

The decision-making model influences the extent to which working capital decisions are not made by a single pool of selected and directly controllable subjects, but are made at all levels of the company hierarchy: from top management to the last operator in charge of invoicing or delivery.

The organizational model is closely linked to the issues of the decision-making process. Also in this case, in fact, it must be considered that the choices are made at all hierarchical levels, causing problems of coordination. It can be difficult to implement a level of control necessary to verify that this plurality of heterogeneous subjects, act following a logic of optimization at micro and macro level. It can be deduced that the less the structure is able to coordinate itself, the more the various decisions will be in conflict with each other and will cause the level of the operative circulating to increase.

Finally, a factor to consider is the corporate information system, i.e. "the set of interconnected elements that cooperate to collect, process, store and disseminate information to support decision-making processes, coordination, control, verification and estimation in an organization. The existence of an information system makes it possible to standardize behavior that would otherwise be the result of extemporaneous choices based on the intuition of the individuals involved, who could consider their work independent of that of others, generating an exponential growth in the components of working capital. These systems, therefore, allow you to improve control over the decisions made and ensure that

everyone has access to the data they need to make choices consistent with their tasks and business planning.

Taking these factors into account, two objectives should be achieved (Ang, 2014): to combine the management of the individual elements of the circulating currency with each other, but also with other company investments; and to analyze the tools available to the management for the management of monetary flows, both as a final balance and in a preventive manner.

Working capital has been addressed by a wide range of sources of economic literature, starting with the main accounting and corporate finance manuals. However, it has been relatively little taken into account by business realities, despite the fact that a large proportion of failures were due to inadequate decisions in the management of business working capital. However, the literature also tended to deal with the issue of working capital mainly in relation to reclassifications of the balance sheet, calculations of indicators, as well as a component to construct cash flow and financial statements, while today it has acquired a new importance.

Different authors (Meyer, 2007; Nazir and Afza, 2009; Nuhui and D ermaku, 2017) support the importance of working capital management with particular reference to the importance of short-term needs and the management of capital reserves.

Since the financial crisis of 2008, companies have seen a deterioration of their operating environment, with managers forced to apply strict measures, cut costs and postpone investments so as to be able to respond to decreases in demand and consequent reductions in production. As a result, liquidity and working capital have become two variables under very close observation, and therefore under continuous monitoring and control. Working capital management has changed a lot and the most common and widespread policies have been adapted to the new economic conditions. Due to the rapid changes in the economy, companies are renewing themselves and finding new ways to compete and working capital is becoming increasingly important among these. Even the recent economic crisis caused by Covid-19 outlined the crucial role of the operational working capital for the company risk and sustainability.

### **3. OBJECTIVE OF THE RESEARCH, ANALYZED COMMODITY SECTORS AND CONSIDERED VARIABLES**

The main objective of this analysis is to verify if there is a link between the optimization of operating working capital and the profitability of the company. This concept, which instinctively seems obvious, since any optimization should result in a better performance, had never been the subject of analysis with regard to the sector of small-medium Italian companies. It was therefore

considered important to check whether this relationship exist, especially considering that the SME is the most common type of firm in Italy.

The analysis includes an in-depth analysis of Italian SMEs belonging to three different sectors of the food industry. In order to proceed with a meaningful analysis, it was considered appropriate to analyze, in addition to SMEs, large companies in each sector to use them by benchmark and variable more sensitive, as it consists of a smaller number of companies, more solid and global and therefore less sensitive to the effects of the crisis. This was done considering that the time horizon had to be as close as possible to the present, therefore certainly including years in which the effects of the 2008 crisis and its consequences were an important exogenous factor that greatly influenced company performance and variables.

The chosen survey area is therefore Italian SMEs. According to the "User's Guide to the definition of SMEs" (European Commission 2015) In Europe in 2013, nine out of ten companies are one SME, accounting for more than 21 million. They have provided 88.8 million jobs, creating 2 out of 3 jobs. It follows that this type of enterprise and its mechanisms are very important to investigate if only for the relevance that comes from such a spread. The basic criteria for assessing whether a company is an SME are clearly based on size. It is important to distinguish SMEs from other types of companies, because they face a number of problems related to market failures and structural barriers that lead them to need special assistance, provided in the form of EU programmes.

A factor to consider is the anomalous increase, but consistent with the general situation, of companies with at least one bankruptcy or liquidation procedure, as it is symptomatic of the difficulties of companies in a context of poor access to credit and tight price competition. As shown in the Figure 6, starting from 2008 the number of companies in bankruptcy or in serious difficulty has grown at a fast pace, with a peak during 2013, followed by a continuous decrease during 2014 and 2015, bringing the values back to those of late 2008 - early 2009.

This fact has a great influence on the analysis, because if a company is in a precarious situation, it is unlikely that, even with an excellent management of the working capital, it will be able to achieve good performance. The SME conglomerate is therefore made up of very solid companies that have managed to grow despite the difficulties and that have remarkable results, and companies in crisis, in a much larger number than in the past, which instead lower the sector and global averages. It is a decidedly heterogeneous whole, but it represents the majority of the Italian entrepreneurial activity, and therefore it is considered valid of an in-depth analysis.

There are many variables that can affect the company's profitability. The most important is the trend of the economy, which affects all companies operating on the national territory. In order to

assess the effects of the crisis on productivity at national level, data were extracted for a summary indicator, GDP, the value of which is issued quarterly by ISTAT.

GDP is a macroeconomic measure sensitive to changes in output and hence in demand at the national level. The figure 7 is expressed in percentage values, in which 2007 is taken as the base year, which is therefore worth 100. It can be seen on the same graph that during 2008 there was a collective collapse at the level of the European Union, but recovered completely (or almost) in 2011 by the other countries, primarily by Germany.

On the contrary, the Italian situation is still very critical, as evidenced by the fact that GDP has not yet returned to pre-crisis levels, even though it shows a slight growth in the data for 2017, then stable for 2018.

Other elements to consider before proceeding with the analysis are data on differences in productivity trends according to the size of the enterprise. It is important to underline the differences between large enterprises and SMEs, especially as both categories will be used in the analysis, one as a variable in question and one as a control variable.

Production levels have not yet returned to the levels of 2007, prior to the outbreak of the crisis, confirming the adequacy of macro data such as GDP to judge the performance of each size category. It is interesting, however, to evaluate how the category of medium-sized enterprises managed to exceed the 2007 standards in 2014, the only positive note of the data under examination. It can also be seen that the average values, regardless of the year, are much higher in large companies than in SMEs, with a difference of around 20,000 euros of added value per employee.

This difference is physiological, as large companies can benefit from economies of scale and have fewer barriers to entry, as well as greater production and distribution capacity. The figure presented in the Figure 8 becomes even more important if we consider that the number of employees in recent years has gradually decreased in the SME segment.

This is probably due to both technological innovation and the continuous drive to reduce costs, whether fixed or variable. This trend has not been so strong in big business and could lead to further discrepancies in the results of the two categories.

A final point that should be mentioned in relation to SMEs in recent years is the suffering. Although the impact of debt has already been considered in terms of bankruptcies or liquidations, it requires further attention, as it is not certain that the presence of impaired debts of companies will only lead to such consequences. Even those companies that have managed the situation and survived the crisis may have had difficulties leading to late payments, the need to restructure loan conditions (which has seen truly exceptional growth) or the overrunning of exposures.

On the basis of the elements that characterized the SME, a time horizon was chosen starting from 2008, the first year in which the effects of the crisis occurred, in order to produce an analysis on the basis of a set of homogeneous values. Taking into account the data for 2007 would have meant creating significant distortions, given the evolution of the Italian market over the last decade, very different from what were the previous standards.

By monitoring the data of a large number of companies in the period 2008-2016, it should be possible to verify whether the hypotheses of correlation between a correct management of working capital and performance exist in reality.

### *3.1. Sectors used for the analysis*

As far as the scope of the survey is concerned, it was decided to investigate the food industry, one of the largest and most important realities of Italian production. The three clusters chosen reflect some interesting areas and relevant realities of the productivity of Italy: the production of milk, its derivatives and cheeses, namely the dairy sector (the first Italian food sector); the production of sweets, a reality worthy of note especially for the Piedmont region, hence the confectionery sector; the production of flour and bakery products, which is a clear symbol of Italian identity in the world.

These three areas have been considered because at the level of production and supply cycle they should be considered as similar, all having to interact with local production, legislation related to the agricultural sector and a deterioration of products in the short term. For these reasons, the results of the analysis could be different, but the variables to be affected are more or less the same, making it possible to look for reasons in a very narrow range of variability.

It is also necessary to consider how, in the years 2008-2015, consumption expenditure for food and non-alcoholic beverages in Italy has suffered a decline, as evidenced by the processing of ISTAT data.

It is clear that until 2006 the growth of average monthly household expenditure grew at a high rate, as evidenced by the two-period moving average (red) and that from 2008 onwards this growth not only stopped, but returned to much lower levels. The sum of 462.33 euros on average for 2008 has never been reached again, despite the recovery underway since 2014. This external dynamic cannot but influence the company's performance and it will be necessary to take this into account when commenting on the results produced by the analysis.

### *3.2. Variables relating to dynamics of operating cycle*

To carry out the analysis, it is advisable to construct two sets of variables: the first set contains the symptomatic indicators of the management of net working capital, and the second set contains the

profitability indicators, to measure the company's performance. The first category relates to the dynamics of the operating cycle; they are:

- Days Sales Outstanding (DSO)

It measures the average number of days before customers settle their claims on the company in question after a sale. Irrespective of the extension period granted by the company, creditors may pay before or after that period. There are no standard values within which it can be considered "good". In order to assess this, it is necessary to compare with the average of the companies in the same sector.

- Days Inventory Outstanding (DIO)

This value represents the average number of days the stock is in stock before it is renewed. Even in this case there are no standard values. It is therefore necessary to make an assessment on the basis of the average of the days of rotation of stocks in the sector to which the company belongs, even if the business model adopted can influence it.

- Days Payable Outstanding (DPO)

The result of this indicator is equal to the average number of days before the company pays the debts it has contracted with suppliers. In this case, it is the nature of the company's activity that has an impact, but above all the size of the company: a known and large company will have more bargaining power and will be able to manage the dynamics of its trade debts at will. This consideration is important, because a longer delay on trade debts corresponds to the company's ability to finance itself.

Therefore, even if a value higher than the average could seem a negative signal and of difficulty in payments, in the presence of a solid financial situation, it is a sign that the company is financing itself in an alternative way. Again, there are no established values and the results have to be compared with the industry average.

- Average Business Cycle Duration (Cash Conversion Cycle - CCC)

This value is the summary of the three previous ones, since it is obtained by adding the number of days of credit extension to that of average stockpile, from which the number of days of debt extension must be subtracted. It is therefore a synthetic measure that expresses the number of days that a company needs to convert incoming resources into cash flows.

The operation required to calculate such an indicator implies that it measures how quickly a company is able to convert liquidity into inventory and trade debts, through the system of sales and receivables, and consequently back into liquidity. Being made up of a combination of these indicators of the state of the company's activity, the CCC indicates how skillful management is in managing short-term assets and liabilities in order to generate liquidity. Also in this case the entity must be measured on the basis of the averages of the sector to which the company belongs and the lower the value of the CCC, the more dynamic the company is and therefore the more it is a good result.

- Net working capital/ turnover

This indicator is the result of the ratio between the value of the net working capital and the turnover recorded in the same year. This ratio is useful to compare different companies but even to measure how the sales growth (or decrease) affects working capital behavior.

- Working capital / turnover

The result of this indicator is obtained by the ratio between the components of working capital assets, i.e. inventories and account receivables, and turnover for the same period. In this case, too, the main aim is the comparability of the results between different years and companies investigating how the ratio changes between companies of different sizes and with different growth rates and if there is positive correlation with profitability.

As with the previous one, the interpretation of this value is subject to the action of different forces. Mathematics suggests that an increase in the denominator, i.e. in turnover, which is a positive signal for the company, would lead to a decrease in the result.

### 3.3. Variables relating to performance

The performance variables taken into consideration are the main profitability indicators plus an element that concerns the sustainability of the company.

- Return on assets indicator (ROA)

The ROA expresses the rate of return on the company's total assets. It is an indicator of efficiency in the use of the resources present in the assets in order to produce a profit. The ROA is obtained from the product of the ROS and the rate of rotation of the asset. ROA is also one of the factors that must be multiplied to obtain ROE. This indicator can be used to determine whether assets are best managed in such a way as to ensure profitability or not.

- Return on investment (ROI) indicator

ROI is the return on investment offered by the company. It is one of the most commonly used indices obtained by a ratio where the numerator represents the result of normal operations, while the denominator is made up of investments in the core business net of accumulated depreciation and any provisions. The ROI is an indication of the degree of efficiency in the use of the resources available to the company to produce profits through its characteristic activity. ROI is also obtained from the product of ROS and the sales turnover rate. ROI can also be used as a factor in obtaining ROE.

- Return on sales (ROS) indicator

ROS provides an indication of sales profitability. It is one of the most significant indexes to obtain information about the efficiency of a company. It is a ratio where the numerator is composed of the Earnings Before Interests and Taxes, i.e. the result of the operating area before the deduction of interest and taxation. By multiplying the ROS by 100 one gets the income produced by the operational

management for every 100 euro of sales volumes. Being so closely linked with turnover and business operations, it is one of the most useful indices for the analyses that will be produced, along with the ROA.

- Return on Equity (ROE) indicator

ROE expresses the profitability of equity capital and is used to verify the rate of return on risk capital. It is a global index, which provides a summary of the overall economy of the company, assessing how own resources have been managed in order to increase profits. This indicator is perhaps the least sensitive to the dynamics related to working capital, but it should be taken into account because it offers an overview of the performance of the company.

- Indicator of a financial sustainability (PFN/EBITDA)

The index derived from the ratio between the net financial position and the Earnings before Interest, Taxes, Depreciations and Amortization expresses the amount of time it would take for the company to use the entire EBITDA for the sole purpose of repaying financial debts. The greater the result of this indicator, the greater the financial risk of the company, as it demonstrates that it does not have sufficient flows produced by the operating area to allow a short or medium-term coverage of financial liabilities. On the contrary, the smaller the result of the relationship, the greater the ability to produce wealth and therefore sufficient financial resources to meet its commitments. Usually this index is used together with the index "Net financial interests/EBIT" to measure the financial risk.

A major difficulty with this indicator is that some components of NFP and EBITDA are not clearly indicated looking at the balances, without supplementary information or a due diligence (i.e. overdue debts, amount of factoring and financial leasing, extraordinary revenues). Nevertheless, this indicator gives a quick signal of the company's riskiness and seemed to be a valid means of comparison for the analysis of working capital.

#### 4. RESEARCH METHODOLOGY

The survey is the main tool used for the data collection and is structured on three levels and on the basis of three questions:

1. Does Working Capital Management affect short-term profitability?
2. Is this impact the same in SMEs and large enterprises?
3. Does this impact depend on the sector in which the companies operate?

By verifying these three hypotheses, we investigated by this research, for the first time, an important sector of the Italian SME using the size and product sector of the companies taken into consideration as additional filters, with a span of time that allows reports to be made on the basis of different intervals.

In order to ensure that the survey basin is large enough to be meaningful, quantitative data were collected from an online database, AIDA, for the duration of the previously established time horizon (2008-2015). These data are collected for all database holdings in the dairy, confectionery, flour and bakery industries.

Once the companies were divided between SMEs and large companies, a descriptive statistical analysis was carried out, which provides a framework of the sector averages for each of the indicators chosen as determining factors and serves to give an overview of the trends of the period.

Subsequently, the indicators relating to working capital management were collected and a score assigned to each company for each year on the basis of these indicators. At this point, the presence of a statistical correlation between the variables related to the NWC and the main profitability indicators previously selected can be verified.

The results produced should be able to give an answer to the three questions mentioned above regarding the Italian SME in the years after 2008.

AIDA, an online database, was used to collect the data. AIDA is a tool of Bureau van Dijk, a company specializing in the production of products containing company information at national and international level. AIDA (Computerized Business Analysis) is a factual database containing structured information on more than 700,000 companies operating in Italy. The data are in historical series, up to a maximum of 10 years and the information is constantly updated. The contents are the complete financial statements, in accordance with the format of the Fourth EEC Directive, the sectors of economic activity, the complete personal data and a plurality of other information of Italian capital companies.

The research carried out was carried out using ATECO codes, which serve to classify economic activities, to allow the results to be filtered by type of business activity. This classification is adopted by ISTAT for national economic statistics and is optimal for this analysis as it is based on the type of activity carried out by the companies and not on what they produce. In this way, companies grouped under the same code can be considered homogeneous in terms of production processes and therefore the need for supply, production cycle and type of plant. Consequently, this subdivision makes it possible to consider the data of each sector as pure exogenous variables, since they are all subject to the same influences from the external environment.

With regard to this analysis, in particular, the sectors covered by the whole of code 10, which groups together food businesses, were examined. Specifically:

- Code 105 (dairy industry) has been used as a filter for the dairy sector;

- Codes 1072 (production of rusks and biscuits; production of preserved pastry products) and 1082 (production of cocoa, chocolate, candies and confectionery) were used to group companies in the confectionery sector;

- Codes 1071 (production of bread; fresh pastry goods) and 1073 (production of pasta, couscous and similar farinaceous products) were used to select enterprises for flour and bakery products.

In addition to the codes, two conditions have been used as additional filters to search for data relating to each sector: the first is represented by the availability of the balance sheets, the second by the presence of known values relating to the NWC. Table 1 depicts a summary of collected data.

**Table 1.** Sample of available data and search criteria

| Terms and conditions  | DAIRY              |                            | SWEETNESS          |                            | FLOUR AND BAKERY PRODUCTS |                            |
|---|--------------------|----------------------------|--------------------|----------------------------|---------------------------|----------------------------|
|   | Total availability | progressive search results | Total availability | progressive search results | Total availability        | progressive search results |
| Years with available budgets: 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015  | 1.247.546          | 1.247.546                  | 1.247.546          | 1.247.546                  | 1.247.546                 | 1.247.546                  |
| ATECO: 1072 - Production of rusks and biscuits; production of preserved pastry products, 1082 - Production of cocoa, chocolate, candies and sugar confectionery | 2.247              | 1.961                      |                    |                            |                           |                            |
| ATECO: 105 - Dairy industry   |                    |                            | 908                | 781                        |                           |                            |
| ATECO: 1071 - Manufacture of bread; fresh pastry goods and cakes; 1073 - Manufacture of pasta, couscous and similar farinaceous products                        |                    |                            |                    |                            | 5.271                     | 4.061                      |
| Business Cycle Duration (days): All companies with a known value 2015, 2014, 2013, 2012, 2011, 2010, 2009, 2008. For all selected years                         | 44.380             | 215                        | 44.380             | 101                        | 44.380                    | 101                        |
| <b>Total</b>  | <b>215</b>         |                            | <b>101</b>         |                            | <b>93</b>                 |                            |

Not all the companies have data on the annual financial statements of all years on the database, and for the present study it was necessary to maintain a constant number for the whole period under review. In this way you it is guaranteed to have all the data available for the study to be complete. Out of a total of 1,247,546 companies with data on financial statements for the period 2008-2015, only 44,830 have the value of the NWC for all the years under consideration. The results therefore include an analysis of 93 companies for the confectionery sector, 215 for the dairy sector and 101 for flour and bakery products.

#### 4.1. Statistical data analysis

The first operation carried out on the collected data was to subdivide, using the selection criteria for SMEs of the European Commission to separate large enterprises from SMEs. Since the figures for eight years had to be taken into account, a choice had to be made as to the number of years that the limits had been exceeded, so that the company could no longer be regarded as a SME. The criterion adopted is as follows: if the company exceeds the SME criteria for more than three years, then it is considered as a large enterprise; if there is an excess for less than three years, it is considered as an SME. The result is depicted in table 2.

Table 2. Breakdown of large enterprises and SMEs

|          | DAIRY | SWEETNESS | FLOUR AND BAKERY PRODUCTS |
|----------|-------|-----------|---------------------------|
| Large E. | 35    | 24        | 15                        |
| SME      | 180   | 69        | 86                        |
| total    | 215   | 93        | 101                       |

For each category of each sector, the basic elements of the descriptive statistics were calculated: average, maximum, minimum, median and standard deviation, with reference to the main indicators of both circulating and profitability. For the sake of synthesis, only the arithmetic mean is described in this paper, considering that the other elements do not play a key role in modifying the results of the analysis. These data are depicted in the following table 3.

Table 3. Arithmetic mean of collected data

|                      | DAIRY   |        | SWEETNESS |        | FLOUR AND BAKERY PRODUCTS |        |
|----------------------|---------|--------|-----------|--------|---------------------------|--------|
|                      | Big     | SME    | Big       | SME    | Big                       | SME    |
| Turnover/million EUR | 180.323 | 16.238 | 291.083   | 20.052 | 258.858                   | 12.947 |
| CDT                  | 66,34   | 84,07  | 114,85    | 111,45 | 67,86                     | 96,39  |
| ToS                  | 50,67   | 64,39  | 38,87     | 39,75  | 27,80                     | 26,50  |
| DTD                  | 76,55   | 97,65  | 118,94    | 112,45 | 106,21                    | 114,31 |

|     |       |       |       |       |       |       |
|-----|-------|-------|-------|-------|-------|-------|
| BCD | 59,66 | 74,43 | 78,43 | 86,51 | 10,98 | 36,26 |
| ROA | 5,30% | 3,37% | 5,00% | 4,35% | 5,32% | 3,03% |
| ROI | 6,66% | 5,31% | 8,70% | 6,94% | 8,63% | 5,97% |
| ROS | 3,84% | 2,30% | 4,47% | 3,68% | 5,30% | 2,75% |
| ROE | 6,66% | 4,50% | 5,50% | 4,63% | 6,05% | 1,99% |

In terms of turnover, the confectionery sector has the highest sales in SMEs, averaging around 20 million, followed by around 16 million for milk and almost 13 million for flour products. As far as large companies are concerned, the same order is not followed, but it is urgent to underline the presence of two enormous companies in the confectionery sector (Ferrero) and in the flour products sector (Barilla), which bring their averages to be higher than in the dairy sector, where the largest companies are not so global and known (e.g. Granarolo and Parmalat).

Credit deferral times (CDT) are particularly efficient for dairy companies, although they show that large companies are reimbursed almost 20 days earlier than small to medium sized companies. The same dynamic is found in flour products, where SMEs have to wait 96 days, almost 30 days longer than large companies. While the two sectors offer similar values for the latter (66 and 68), the same cannot be said of SMEs, which receive payments in the milk sector more than ten days earlier than the flour sector. The confectionery segment, in which both large and small companies have to wait more than 110 days for loans to be repaid, should be treated separately, with a reversal of the trend whereby larger companies have longer times than SMEs. Being such a substantial difference with respect to other sectors, but with constant values despite the size of the companies, it can be assumed that it is a physiological factor of the type of activity.

Paying attention to the timing of stockpiles (ToS) we can see that for the confectionery and flour sectors, the differences between SMEs and larger companies are minimal (39 and 40 days for confectionery and 28 and 27 for flour) and particularly small, which is not surprising if we consider the fact that they are industries that produce perishable goods. On the contrary, the dairy sector again has similar timescales between SMEs and large companies, but much longer. This is mainly due to the nature of the output of these companies: they are mainly cheeses, a product that allows a longer-term preservation than other food products.

As far as the time required to defer trade debts (DTD) is concerned, it can be seen that for confectionery and flour products the number of days is essentially the same between large companies and SMEs (119 and 112 for confectionery, 106 and 114 for flour products), always around four months. It is very interesting to point out that in the confectionery industry, the times of larger companies exceed those of SMEs, as the former use bargaining power to their advantage, so as to establish longer delays and self-finance through them. It is also true that in the confectionery sector, the days of credit deferment and those of debt are practically the same (115 and 119 for large companies, 111 and 112 for

SMEs), while in the other sectors, the timescales for debts are considerably longer, allowing all types of company to finance themselves in this way.

In terms of business cycle duration (BCD), the flour products sector emerges as the most efficient, with a value of 11 days for large companies and 36 days for SMEs. The other two segments show very different results, ranging from 60 days for large dairy farms to 87 days for SMEs in the confectionery sector.

The first of the profitability indicators, ROA, shows a picture of homogeneity in terms of distribution, in fact, SMEs in all three segments have values lower than the large ones, and the values of larger companies (5.3% for milk, 5% for confectionery and 5.3% for flour). The behavior of SMEs in the milk and bakery sectors is broadly similar (3.4% and 3%), while in the confectionery sector the value is higher and closer to that of the benchmark (4.4%).

The ROI shows very different results: the trend of the confectionery industry to have excellent performance is confirmed, especially with regard to SMEs (6.9%, compared to 5.3% for milk and 6% for flour), while for large companies it is practically equaled by the performance of flour (8.7% and 8.6%). The dynamics of dairy products deserving a more in-depth analysis, which have the same profitability for large companies as for SMEs in the other segments (6.7%), well two percentage points lower than for other larger companies. Dairy SMEs also show a low return on investment, albeit at a shorter distance from the others considered.

The analysis of the results offered by ROS confirms the trend of lower profitability of dairy products compared to other sectors, with lower averages for both SMEs and large companies. In this case, the performance of the larger companies in the farinaceous sector is better than that of the confectionery sector (5.3% and 4.5%) and the trend is the opposite for SMEs (2.8% and 3.7%). This type of index is one of the most interesting in relation to our analysis and so low results for dairy products will have to be considered in the interpretation of the final results.

ROE reverses the analyses made so far, seeing dairy products as the best performance for large companies (6.7% compared to 6% for flour and 5.5% for confectionery) and a result for SMEs on the same level as those of confectionery (4.5% and 4.6% respectively). It can be inferred that this index, which is more global in nature, compensates for the reduced performance of return on investment and sales by taking advantage of other sources. For the other segments, yields for large companies are sufficiently similar, fluctuating over a period of one percentage point. For SMEs, on the other hand, the result for bakery products companies is very low, at just 2%, less than half that of other sectors. This is certainly due to low profitability of assets (ROA was 3%) and sales (ROS was 2.8%), but it is also clear that there is a gap in the overall result not included in the calculation of other indicators, such as the degree of erosion of operating income and the leverage ratio.

## 5. SCORING AND DISCUSSION

The objective of this analysis is to produce clear and concise results from the correlation between the trend in operational working capital and the main profitability indicators. Although it has selected six main variables on which to base its examination of the trend of working capital and five performance indices, the correlation of this plurality of data would produce a very high number of results, making the comparison infra-dimensional and infra-sectoral. Consequently, a way was sought to modify the process in order to make the mechanisms in place more complex, but an output that would allow conclusions and comments to be drawn on the subject.

The solution we have chosen to use is to create a scoring system for the elements of the circulating currency, through which to assign a real "vote" to each company for the value of each indicator for each year. The sum of these scores should be symptomatic of the company's ability in working capital management.

First of all, an Excel file was produced for each dimensional category of each sector, with a sheet for each year of the time horizon. In each of these sheets, the data of each company relating to the circulating indicators have been collected.

Once the data had been prepared in this way, the average, maximum and minimum values were calculated. These terms will be used for the construction of the scoring system.

The requirements underlying the choice of the number of possible votes for each indicator were those of containing the computational burden at levels manageable by Excel, while providing a sufficiently sensitive assessment that could be a good measure of the ability shown by the company in optimizing the circulating. It was therefore decided to divide the amplitude of the range of values into eight, keeping the average as the needle of the balance. Constant incremental factors were then calculated, one positive and one negative, which added (or subtracted) four times to the average.

Eight intervals are thus created which correspond to an evaluation expressed by integer values 1 to 8. Not for all the variables taken into consideration is the assumption that the closer the data is to the maximum, the better is working capital management. As a result, a case-by-case evaluation was carried out, which determined for which variables to follow an increasing order in the scores and for which to follow a decreasing order. The first category includes the degrees of net working capital and of working capital receivable on turnover, together with the deferral times in the payment of trade payables. In the second there are the remaining ones, i.e. the deferral times of receivables from customers and stock in stock and the average duration of the commercial cycle.

Once this part was complete, it was enough to have an automated Excel formula assign the score according to the interval in which each piece of data fell, thus creating a timely evaluation. At this point it was assumed that all the indicators had the same importance, so we applied a unit weighting

weight to each and created the final score for each year of each company by simply adding the votes obtained on the result of each indicator, as in table 4.

Table 4. Score assignment to large flour and bakery companies (year 2008)

|            | Active circ. | NWC | CDT | ToS | DTD | BCD | SCORE |
|------------|--------------|-----|-----|-----|-----|-----|-------|
| Company 1  | 2            | 3   | 7   | 4   | 3   | 5   | 24    |
| Company 2  | 4            | 3   | 5   | 8   | 1   | 1   | 22    |
| Company 3  | 5            | 8   | 2   | 8   | 1   | 8   | 32    |
| Company 4  | 7            | 5   | 8   | 4   | 6   | 3   | 33    |
| Company 5  | 4            | 2   | 7   | 5   | 2   | 7   | 27    |
| Company 6  | 5            | 6   | 8   | 7   | 8   | 6   | 40    |
| Company 7  | 1            | 6   | 6   | 1   | 5   | 6   | 25    |
| Company 8  | 5            | 4   | 2   | 1   | 4   | 1   | 17    |
| Company 9  | 5            | 5   | 3   | 7   | 4   | 5   | 29    |
| Company 10 | 2            | 6   | 3   | 6   | 4   | 5   | 26    |
| Company 11 | 7            | 2   | 8   | 4   | 3   | 1   | 25    |
| Company 12 | 5            | 4   | 1   | 6   | 8   | 5   | 29    |
| Company 13 | 8            | 4   | 2   | 1   | 5   | 2   | 22    |
| Company 14 | 1            | 7   | 3   | 6   | 5   | 5   | 27    |
| Company 15 | 3            | 1   | 4   | 2   | 8   | 7   | 25    |

The operation was carried out for the whole time horizon and for both the dimensions of each sector, thus creating summary sheets such as the one in Table 5, here given as an example.

Table 5. Total Scores on Large Enterprises in Flour and Bakery Products (2008-2015)

|            | 2008 | 2009 | 2010 | 2011 | 2012 | 2013 | 2014 | 2015 |
|------------|------|------|------|------|------|------|------|------|
| Company 1  | 24   | 21   | 24   | 28   | 30   | 31   | 22   | 24   |

### 5.1. Correlation

The correlation indicates the degree of the relationship between variables, for example X and Y (Taylor, 1990). If Y tends to grow as X grows, the correlation is positive or direct, if Y tends to decrease as X grows, the correlation is negative or reverse. If a variation of X corresponds to a variation in equal entity and direction of Y, the two variables will have a perfect correlation, with a correlation coefficient of Pearson  $\rho = +1$ . If instead to a variation of X corresponds a variation in equal entity but opposite of Y the two variables will still have a perfect correlation, but with a correlation coefficient of Pearson  $\rho = -1$ . If the two variables have two distributions such that there is no relation between the points generated by one and the other, they are said to be in-correlated and Pearson's correlation coefficient will be  $\rho = 0$ . The Pearson-Bravais correlation coefficient is calculated as the ratio between the covariance of the two variables and the product of their mean squared deviations, or standard deviations.

The calculation of the correlation was iterated to calculate the relationship between the NWC score and the various profitability indicators, using the individual data of each company as a distribution, over time horizons of 1, 2 and 3 years at a time.

Table 6 shows an example of the results of the correlation between the NWC score and the ROA over a one-year time horizon for large flour and bakery companies. It should be noted that the values in bold have a statistical significance, so they are positive correlation index, the numbers in red are negative correlation index and the rest show in-correlation.

| $\rho$ one year | ROA   |       |       |       |       |       |       |
|-----------------|-------|-------|-------|-------|-------|-------|-------|
|                 | 2009  | 2010  | 2011  | 2012  | 2013  | 2014  | 2015  |
| NWC 2008        | -0,22 | -0,15 | 0,08  | -0,17 | 0,04  | -0,22 | -0,19 |
| NWC 2009        |       | -0,44 | -0,44 | -0,42 | -0,33 | -0,54 | -0,35 |
| NWC 2010        |       |       | 0,44  | 0,45  | 0,31  | 0,20  | -0,02 |
| NWC 2011        |       |       |       | 0,29  | 0,40  | 0,19  | 0,10  |
| NWC 2012        |       |       |       |       | 0,11  | 0,27  | 0,30  |
| NWC 2013        |       |       |       |       |       | 0,20  | 0,10  |
| NWC 2014        |       |       |       |       |       |       | 0,01  |

In order to be able to comment on the results obtained, a summary document was produced which gave the possibility to examine, for each time horizon, the correlations between the profitability indicators and all the sectors taken into consideration. This document is too large to be inserted here as a table, so only synthetic discussion will be reported. The behavior of the variables in the various cases examined was not homogeneous and standardized, but peculiar in each of the elements

examined. Consequently, we are going to observe the results of the correlations for each dimensional category of each sector.

Dairy SMEs, except in very rare cases, show in-correlation with all profitability indicators, this result is evident both graphically by looking at the correlation tables. Another useful tool, however, may be the dispersion graphs, in which it is noted that the variables of this cluster are particularly widespread and do not make it possible to find a trend line that expresses a link between their NWC score and performance indicators. Evidence of all this is found in the Chart19, which shows the dispersion of the values of the score of the NWC for the year 2009 and the ROA for 2010. This group of values was chosen because it shows one of the correlation coefficients closest to zero in the study, i.e. 0.004. This representation clearly shows a flat trend line documenting that the two variables are not correlated. For comparison, let's create the same representation in Figure 20 for the category with the highest correlation, the large confectionery companies, which between the NWC 2008 and 2013 and the ROA of the following years have a coefficient of respectively 0.444 and 0.516. The differences are considerable in the width of the dispersion and in the inclination of the trend lines. It should be stressed, however, that the in-correlation at the statistical level, does not imply that there is independence, but simply that there is no direct relationship between the two variables.

Large dairy companies have a negative correlation with ROA and ROI over all time horizons considered. The behavior towards ROS and ROE is almost always in-correlation, but not in longer-term comparisons, where they confirm the negative trend. There is an indirect correlation, however, also towards NFP/EBITDA in most cases, a factor that seems to demonstrate a slight link at least from the debt point of view.

The SME in the confectionery sector offers more satisfactory results than in the previous sector, in fact, in many of the cases examined, there is a direct correlation with ROI and an indirect correlation with NFP/EBITDA. This result is not equaled in the cases of ROA, ROS and ROE, with which it sometimes emerges in-correlation, or even a significant and negative result, as in the case of one-year ROE.

The large confectionery companies, on the other hand, represent the success of the assumptions underlying this study, as they have a strong correlation with the main profitability indicators. This relationship is evident from the observation of the Graph20, in which the linear trend lines have a clear positive inclination.

As regards SMEs in the last segment, flour and bakery products, there is a strong negative correlation with ROS at all-time horizons considered. The other indicators also offer unsatisfactory results, as they show clear signs of in-correlation or indirect relation. The only positivities found refer

to NFP/EBITDA, a variable that is characterized by a different logic, according to which a higher value is higher than a negative signal, therefore it is confirmed what has already been seen in other cases.

For the first few years of operation, large flour companies have strong negative correlations with all profitability indicators and positive correlations with NFP/EBITDA. However, there is a change from 2010, when all indicators change radically, giving results in close relation with the changes in the NWC. This trend ceases to provide significant signals in the medium-term observation, based on a time horizon of three years. It follows that the influence of the NWC on performance exists, but only in the short term.

## 6. CONCLUSIONS

The main objective of this analysis was to verify whether Working Capital Management has an influence on the performance of Italian SMEs, focusing in the food sector.. In more detail, the research was based on these three questions, corresponding to as many levels of investigation:

1. Does Working Capital Management affect short-term profitability?
2. Is this impact the same in SMEs and large enterprises?
3. Does this weight depend on the sector in which the companies operate?

To satisfy these questions, an analysis was carried out based on the data collected by the AIDA database, which features the financial statements of Italian companies, relating to the variables of working capital, business cycle and performance. This information has been filtered to create six clusters, representing SMEs and large companies in each of the three sectors considered: dairy, confectionery, flour and bakery products. Through a scoring operation and a statistical correlation, results were obtained, which represent the Pearson-Bravais correlation indices between NWC and profitability indicators over different spans of time (one, two and three years).

It is now possible to give answers based on the results obtained. Surely the NWC has a correlation with short-term profitability, as is evident from the fact that in many cases there is some kind of significant relationship, whether direct or indirect. Also with regard to the impact of the dimension on the size of this link, it can certainly be said that it has an impact, since within all sectors large enterprises and SMEs behave differently. Finally, it has been shown that the result of the correlation depends on the sector, since each of the segments of the food industry considered behaves in its own right.

Unfortunately, if it is undeniable that the NWC has an influence on the profitability of the company by observing the complete sample, as far as SMEs are concerned, there is often an in-correlation between the trend in working capital and the business cycle and the main performance indicators. This unsatisfactory result may be due to the particular conditions of the macroeconomic

environment in the years under consideration, in particular the reduction in consumption and average family expenditure, which have aggravated a condition already made precarious by an exponential increase in suffering and, as a result, bankruptcies and liquidations. These conditions are due to the crisis that has affected global markets since 2008, and the resulting credit crisis in subsequent years. It should also be considered that in-correlation results may be due to the typical characteristics of data dispersions. In fact, a greater variability in values can invalidate the result of correlation studies, providing results of in-correlation even where there is no independence between indicators.

Other factors that may have limited the study are without recourse and the availability of complete data on the database used. With regard to the management of without recourse, reference is made to a type of factoring that "lightens" the quantity of receivables in the company portfolio, thus affecting the correctness of the data relating to working capital. It has been used extensively during the years within the time horizon, as this has ensured a better valuation of the company by banks and lenders, making the business situation seem more prosperous. Unfortunately, the data on the use of without recourse would have to be requested individually from each of the companies included in the sample, through questionnaires or direct queries, which would have taken much longer and would have reduced even more the number of companies taken into account. On the other hand, as far as the completeness of the database used is concerned, of the 8,426 companies operating in the three sectors considered, only 409 had data relating to the entire time horizon and with available values of the size of the business cycle. This sample, however large, corresponds to about 5% of the total and may not represent the totality of the data distribution.

Consequently, we can conclude by stating that, despite the fact that in the period 2008-2015 the results relating to the SME are mainly in-correlation, with different market conditions, this result may vary, since the environment has suffered very specific shocks that are unlikely to be repeated in identical ways within another time horizon. A further factor that

The fact that large companies in all the sectors concerned have produced significant direct or indirect correlation results contributes to the formulation of this observation. These implications, once it has been established that large companies are characterized by greater solidity, brand image and bargaining power and therefore greater resistance to the crisis, suggest that even SMEs in a context different from that observed can achieve the same results.

Future researches can investigate even the relations between NWC and volatility of turnover and /or its growth or decrease in the same or other sectors.

### ABSTRACT

After the economic crisis of 2008-2009, the increase of investor Financial Literacy (FL) has become a public policy objective to improve welfare through better decision making.

The aim of this paper is to describe the impact of FL on investors' choices. We present a theoretical approach that will require – in a future – an application to test the model proposed.

During the last few decades, the attention to Financial Literacy has produced a growing interest to explore the link between Financial Literacy and Financial Behaviour. However, the first consequence of this attention is that there is no clear definition of Financial Literacy. Moreover, the review of the literature shows a fragmentation, and this has prevented the formulation of a unified point of view on FL and investors' behaviour relation. For these reasons, this topic requires new and deeper studies.

In this paper, we propose a theoretical model to study if financial education and financial literacy influence the diversification strategies in financial choices. For this reason, we apply a multi-criteria analysis that can integrate the various aspects into a uniform evaluation. In particular, our model implements the AHP method.

Following the model suggested by Rossi et al (2020), for evaluating the best investment choice we analyse three criteria: the return of the stock market, the performance of government bonds and the calendar effects in the financial markets. Then, in order to test if Financial Education have a positive impact on decision-making investors' process, we will submit a questionnaire to two groups of financial operators: a financial illiterate operators group (illiterate classroom) and a financial literate operators group (literacy classroom). Applying the same AHP model to both groups of operators may allow us to verify the influence of financial education and/or financial literacy on the investment choice.

*Keywords: financial literacy, AHP method, investors' behaviour, cognitive-behavioural distortions,*

## INTRODUCTION

Recent globalization and deregulation processes have generated a new phenomenon: the financialization of the economy; this means the growth of the weight of financial assets within the economic context. This process begins to take shape when the idea of generating financial income seems to become much more profitable than producing value added through the company's traditional production processes (Gallino, 2005). A tension arises between finance and production: to innovate and experiment with new production opportunities, companies begin to need long-term financing, the so-called "patient capital" that traditionally was seen in collaborative relationships between banks and companies as well as between companies and workers (Bagnasco et al., 2012). National systems thus begin to suffer "the intrusion of financial and capital markets focused on monetization and short-term profits" (Ingham 2008: 235): impatient capital come in the scene and it speculates and introduces new forms of fragility into the system (e.g. derivatives and futures).

In this complex and irreversible framework, there are many reflections that have to do with the individual behaviours of individual financial operators (ethical, value, rational orientations) but equally strong is the question of the levels of competence (skills) and knowledge which financial operators have (or should have). In Italy, the findings of CONSOB and the Bank of Italy shown that the level of economic and financial knowledge is particularly low, even if simple logical and mathematical notions and skills are considered.

In a hyper-technological society, characterized by increasingly complex financial markets and governed by uncertainty and instability, financial knowledge has a decisive influence on the attitude towards risk and on the investment choices to be adopted.

People are increasingly alone and isolated in their social relationships and this, in some aspects, is even more true in the economic and financial choices that can hide dangerous pitfalls. These can lead to irrational and / or wrong choices. We have cognitive-behavioural distortions that sometimes make us make bad decisions; the most common is being much more oriented to the present than to the future, and therefore making choices that favour the short-term horizon over the medium and long-term one. This behaviour often leads to underestimations. Another of the distortions is that we tend to overestimate our skills (the so-called overconfidence) which sometimes leads us not to ask when we should ask experts instead.

In Italy, has shown by the S&P Global FinList Survey (2014), only 37% of the population knows some basic concepts of financing investments. Furthermore, although it is clear that if you choose an investment with a very high return, the risk increases exponentially, in reality the investor continues to believe in the chimera of high returns with very low risk. Although this is a problem common to other countries, in Italy the average level of knowledge is worrying. If we consider basic financial

knowledge, Italy is closer to the BRICS (Brazil, Russia, India, China and South Africa) than to the G7 countries.

These considerations, combined with the structural changes in the welfare systems, in the labour market, in the financial markets, underline the problem of financial education and its diffusion<sup>6</sup>. It is evident that financial knowledge is important because it influences the financial choices. It is necessary to achieve the basic skills that can help in the decision-making process.

On average, there is a socio-cultural problem concerning low knowledge on these issues. The consequence is generalized ignorance, mixed with feelings of distrust and laziness. All obstacles to be removed, because financial ignorance carries significant costs. Consumers who fail to understand the concept of interest compounding spend more on transaction fees, run up bigger debts, and incur higher interest rates on loans (Lusardi and Tufano, 2015; Lusardi and de Bassa Scheresberg, 2013). They also end up borrowing more and saving less money (Stango and Zinman, 2009). Meanwhile, the potential benefits of financial literacy are manifold. People with strong financial skills do a better job planning and saving for retirement (Behrman et al., 2012; Lusardi and Mitchell, 2014). Financially savvy investors are more likely to diversify risk by spreading funds across several ventures (Abreu and Mendes, 2010).

Therefore, the purpose of financial literacy is to direct social actors (financial and non-financial operators) to virtuous behaviour: to distinguish between risks and opportunities; to reduce over-indebtedness risks, to improve savings choices, and to help reduce inequalities.

## LITERATURE REVIEW

After the economic crisis of 2008-2009, the increase of investor Financial Literacy (FL) has become a public policy objective to improve welfare through better decision making. In all developed countries, policymakers consider FL as solution to increasing bankruptcies. This could be particularly true because the expansion of financial markets has provided opportunities for people to invest in a variety of securities and financial instruments. In fact, today the volume and percentage of people who invest in stock market securities have risen sharply in recent years (Dreman et al, 2001), suggesting that there are a growing number of retail stock market investors.

As scientific result, the attention to Financial Literacy has produced a growing interest to explore the link between Financial Literacy and Financial Behaviour. However, the first consequence of this attention is that there is no clear definition of Financial Literacy. In fact, despite the proliferation of researches on Financial Literacy, "no consistent definition or empirically validated measures of

---

<sup>6</sup> An old English proverb said "don't put all your eggs in one basket". In reality, the common approach for the diversification of investments in the financial field would not seem pursued

Financial Literacy exist” (Schmeiser and Seligman 2013: 243). The general confusion could be synthetize by Redmund (2010): “Is Financial Literacy the right phrase, though, to describe what a consumer needs to effectively adapt to changing needs, life events and economic forces? The question is moot” (277).

Despite all, from a decade Financial Literacy is consider synonym of the ability to understand and effectively use knowledge and various financial skills to manage financial resources, ideally for a lifetime of financial stability (World Bank), and it is consider synonym of Financial Education (FE). “The terms Financial Literacy, Financial Knowledge, and Financial Capacity are often used interchangeably” (Harrison, 2016: 1).

However, more specifically, FE could be defined as “the process by which financial consumers/investors improve their understanding of financial products and concepts, and through information, instruction, and/or objective advice, develop the skills and confidence to become more aware of financial risks and opportunities to make informed choices, to know where to go for help, and to take other effective actions to improve their financial well-being” (OECD, 2005: 4).

One of the first study on FL could be dated at the end of Fifties (Jelley, 1958). However, the most important studies were realized in the 2000s (Braunstein and Welch, 2002; Fox et al., 2005; Martin, 2007; Kozup and Hogarth 2008; Hastings et al., 2013).

Our analysis focuses on Financial Literacy and Investor Behaviour. This topic is most important in a context of growth of financial products available. Many of these studies concerned Financial Literacy Education (FLE) of a group of students. Generally, FLE programs assumed to improve investor behaviour in relation to financial products and services (West, 2012). This theme is complex and this is demonstrated by the fragmentation of the literature. In this paper, we realize a brief general literature review on FE and investors’ behaviour (Table 1).

Table 1. Studies on FL and Investors’ Behaviour: a comparison

Source: authors’ calculation

A branch of studies underlined a positive relationship between Financial Literacy and Investors’ Behaviour. Bernheim et al. (2001) conducted one of the first studies on Financial Literacy Education (FLE).

The analysis is based on a unique cross-sectional household survey fielded in November 1995, and 2000 surveys were completed. They identifies a positive relation between the role of financial education at high school level and higher subsequent savings rates.

Gross et al. (2005) analyse a pilot financial literacy education course for Northeastern law students. The study involved focus groups and a pre- and post-test questionnaire that was conducted to test its usefulness. The article also describes adaptations made to the course following the study and makes suggestions for course replication. Gross et al. (2005) sustain that teaching financial literacy to students has measurable benefits: "...initial results here and other empirical work on financial literacy education demonstrate that courses such as this lead to longer-term retention of knowledge and positive changes in consumer attitudes and behavior..." (22).

Similar results was highlighted from different scholars (Tennyson and Nguyen, 2001; Wiener et al., 2005; Disney and Gathergood, 2013). Wiener et al. (2005) conduct a study on financial education-training program for residents of New York who had filed for bankruptcy. Authors divides 400 people in three groups: trained debtors, untrained debtors, and non-debtors. Their results confirmed previous studies (Bixler and Squires, 1998; Tennyson and Nguyen, 2001) and they showed that trained debtors' financial skills and knowledge increased after training compared with other two categories. More specifically, "trained debtors showed more negative attitudes towards unnecessary spending compared with the other two groups and reported less intention to buy than non-debtors reported" (Wiener et al., 2005: 347).

The impact of FL was studied during the economic crisis of 2008. Van der Crujisen et al. (2011) highlighted that since the onset of the financial crisis consumers with more understanding of banking supervision and insurance have more extensively diversified their asset portfolios across banks.

The study of consumer credit users was the focus of Disney and Gathergood (2013). They studied a representative sample of UK consumer credit users. This research showed a clear relationship between FL and the composition of household consumer credit portfolios. Results from the statistical analysis showed that households with household heads who perform poorly on the financial literacy questions hold a greater fraction of high cost credit in their portfolios. In particular, "We show that individuals who borrow on consumer credit exhibit worse financial literacy than those who do not" (Disney and Gathergood, 2013: 2246).

Cavezzali et al. (2015) realised an investigation to study if financial education and financial literacy influence the risk taking of non-professional investors and the diversification strategies pursued. Authors submitted a questionnaire to 711 US residents. The results highlighted that financial education prevents financial illiteracy and changes the investment process of investors. Cavezzali et al. (2015) – using metric produced by Lusardi and Mitchell (2008) – demonstrated that financial

literacy, does not influence risk taking, but financial education indirectly exerts its influence also on a simple diversification behaviour (immature diversification. "Whereas for uneducated investors there is no relationship between risk diversification strategies with both financial literacy and the main investor features, for educated investors financial literacy fosters such diversification behaviour" (Cavezzali et al., 2015: 121). Another important research was conducted by Hsiao and Tsai (2018). They realize a study to determine whether people with higher levels of FL are more likely to be active participants in the derivatives markets. The empirical results highlighted that "even after controlling for stock market participation rates, financial literacy represents a significant benefit to individuals since it helps them to lower the entry barriers to purchasing complex derivatives products" (Hsiao and Tsai, 2018: 15).

In addition, Riitsalu and Murakas (2019) realized a study on how subjective and objective knowledge of finance, behaviour in managing personal finances and socio-economic status affect financial safety. Four hypotheses are tested in multiple regression analysis. The main results are that subjective knowledge has a stronger relation with financial well-being than objective knowledge: "The results revealed that objective knowledge has a weaker correlation with financial well-being than subjective knowledge and behaviour do. Therefore, instead of promoting knowledge and skills alone, confidence and motivation to take action for improving financial well-being need to be in the focus of financial education initiatives" (Riitsalu and Murakas, 2019: 946).

Two recent studies (Artavanis and Kara, 2020; Philippas and Avdoulas, 2020) show that financial literacy is a key driver of financial well-being. More specifically, Artavanis and Kara (2020) engages in the theme of student debt by utilising a novel dataset of US students; instead, Philippas and Avdoulas (2020) examine the relationship between financial literacy and financial well-being using a primary dataset of Greek university students who lived through the financial crisis. Both studies highlighted that students with a deficit in financial literacy are more likely to have problems in a future loan payments, investments and all kinds of financial decisions.

Even if a huge part of studies underlined that, a financial illiteracy is associated with mistaken perceptions and wronged investment decisions, not all scholars are in line with these considerations. Kim et al (2003) realised a study to examine the relationships among credit counselling, financial behaviours, financial stressor events, perceived financial well-being. Authors collected data from clients of a large credit counseling organization. Results provide some evidence: "There were no direct effects of credit counseling and a debt management program on financial behaviors, financial well-being, or health after 18 months" (Kim et al., 2003: 85). At the beginning of 2000s, the Financial Services Authority (FSA) desired to improve the financial capability of the UK population. de Meza et al. (2008) analysed this strategy and they showed that financial capability involves knowledge and

skills, but what people choose to know and what they do with their knowledge may primarily depend on their intrinsic psychological attributes. Therefore, psychological rather than informational differences may explain much of the variation in financial capability reported in the FSA (2006) Baseline Survey. The Baseline Survey indicates that in most capability categories, scores improve with age and the level of general education. This is consistent with the importance of attitudes rather than teachable specific knowledge. the consequence for de Meza et al. (2008), is “if poor financial capability is mainly a matter of psychology, the information-based approach of the National Strategy for Financial Capability is likely to have only a modest effect in improving outcomes”.

Furthermore, Mandell (2009) recognises that financial behaviour seems to be positively related by FL, but he argues that the long-term effects of financial education on financial behaviour are less certain. Moreover, Willis (2009) asserts that the efficacy of FLE is based on ideology rather than evidence. Willis (2009) underlines that a critical analysis of the studies usually cited as proof of the effectiveness of FLE tells a number of shortcomings. Therefore, the second branch of studies highlighted the negative or very low relation between FL and investments decision. Choi et al. (2010). They realize a research with MBA students at the Wharton Business School. Authors evaluate why people invest in high-fee index funds. In their investigation, students allocate \$10,000 across four S&P 500 index funds and are rewarded for their portfolio’s subsequent return. Students fail to minimize fees. The research highlighted that investors made simple mistakes in choosing between index-tracking funds that differed only in their administration costs: “If financially sophisticated individuals do not make sensible decisions when confronted with apparently simple choices, the errors in financial decision making may not primarily be due to financial ignorance and lack of financial education but rather in individual cognitive biases” (Choi et al., 2010: 1405).

West (2012) highlighted similar results. This research show that the actions of individuals who are financially literate does not necessarily mean they will demonstrate good financial behaviour. “We propose that in order to improve the financial behaviour of consumers two critical areas need to be addressed. Firstly... highlight to individuals the psychological biases and limitations that they as humans, cannot easily avoid. Secondly the regulation of financial products sold to consumers needs alteration to meet the aim of protecting retail consumers from complex financial products that are confusing, ambiguous and inappropriate” (West, 2012: 1).

These studies show that there isn’t always a linear impact of FL and investors’ behaviour.

The literature review presented in this paper shows the complexity of this phenomenon that is attested by the fragmentation of the literature. This has prevented the formulation of a unified point of view on FL and investors’ behaviour relation, and, therefore, the relation between financial literacy and investors’ choices require new and deeper investigations.

## METHODOLOGY

The Analytic Hierarchy Process (AHP) method, introduced by Saaty at the end of seventies, analyses a decision problem by taking into account several qualitative and quantitative evaluation criteria (Saaty 1980, 1994). The use of AHP involves four steps. At first, all the elements of the problem are identified and hierarchically structured. Then, the elements of each hierarchical level are pairwise compared with respect to every element of the upper level. The second step represents the core of AHP: the decision maker assigns to pairs of elements of a level  $(x_1, x_2, \dots, x_n)$  a dominance coefficient  $a_{ij}$  which expresses the importance he/she attributes to element  $x_i$  over  $x_j$  with respect to a given criterion (element of the immediately upper level). Comparing  $n$  elements, a square matrix of order  $n$  is obtained. This matrix has 1 on the principal diagonal and is obviously reciprocal ( $a_{ji}=1/a_{ij}$ ). Saaty's fundamental scale is usually used to assign judgments. The way in which judgments are attributed is worthy of attention: a consistency check is required to ensure reliability of results (Amenta et al. 2020). After the above consistency check, the third step consists in the determination of a priority vector, derived from each pairwise matrix, in order to evaluate the relative importance of the elements of a single level. Various prioritization methods are proposed in literature (). Finally, a global priority vector is calculated by adding the products of relative priorities for the weights (priorities) of elements in upper levels. This vector provides the global ranking of the alternatives: each component expresses the importance of the alternative with respect to the goal.

## THE THEORETICAL MODEL

We represent the problem by means of a hierarchical structure: the objective, the criteria used to evaluate alternative investments and investment choices. Several contributions of the use of AHP in financial context exist (Zouponidis et al. 2015, Spronk et al. 2005, Saaty and Vargas 1982). In particular, Zouponidis and Doumpos (2002) highlighted that, in order to analyse decision making process involving humans, it is important to consider both individual preferences and knowledge.

Starting from the model suggested by Rossi et al (2019) to analyze an investment choice problem, we consider three evaluation criteria: the return of the stock market, performance of government bonds and calendar effects in the financial markets.

We propose to collect data by means of a questionnaire submitted to two different groups of financial operators (two classrooms of students).

At first, we will apply the group-AHP method to the financial illiterate students (illiterate classroom): students who have to follow the advanced financial course; then, we apply the same model to the financial literate students (literacy classroom): students who have followed the advanced financial course and successfully passed the final exam.

Applying the same group-AHP model to both groups of operators may help us to verify the influence of financial literacy on the investment choice.

Our analysis may be able to assign different weights to operators depending on the degree of financial education: who has a higher level of financial education could make more informed investment choices?

## CONCLUSIONS, LIMITATIONS AND FUTURE DIRECTIONS

The attention to FL has produced a growing interest to explore the link between Financial Literacy and Financial Behaviour. Scholars realised some important studies but the first consequence of this attention is that there is no clear definition of Financial Literacy. FL was confused with other terms and/or it had huge (but not focused) application.

Furthermore, the review of the literature shows a fragmentation, and this has prevented the formulation of a unified point of view on FL and investors' behaviour relation. In this paper, we presented a deep literature review, but results are disjointed and not specific.

For these reasons, this topic requires new and deeper studies. In particular, we present a theoretical method for a future research. We think that the application of the Analytic Hierarchy Process (AHP) method could represent a good solution to a comparison between two different groups: a financial illiterate operators group (illiterate classroom) and a financial literate operators group (literacy classroom).

The main limitations of this study is linked to the nature of the paper: this is a theoretical paper that requires future applications. In this way, we consider to test the proposed model at the begin of 2021 to 100 operators that will form two different class.

### ABSTRACT

In the last few decades, Environmental, Social and Governance (ESG) performance has emerged as an important aspect for developing sustainable strategies that affect overall firm performance (Eccles and Serafeim, 2013). Also for automotive industry, sustainability has become a key competence to fight against climate change, resource efficiency and environmental degradation.

In this paper, we present preliminary findings of a research focused on the effect of a responsible and ethical behaviour on the financial performance of automotive companies.

The aim of this paper is to investigate on the impact of each singular E-S-G dimensions on financial performance, referring to a sample of 28 firms from the three leading automotive manufacturing clusters (Japan, United States and Europe).

Preliminary results show that there is a strong positive relationship between:

- Governance factor and firm market value (Enterprise value), and
- Environmental factor and firm market value (Enterprise value).

Moreover, there is a moderate positive relationship between:

- Governance factor and market performance (Book Value per Share and Leverage), and
- Environmental factor and market performance (Book Value per Share and Leverage).

These are preliminary results of a more complex research. Limitations are linked to the small sample and with the firms' heterogeneity. Moreover, in a future research we want to analyse the relationship between an ESG indicator and economic and financial performances.

*Keywords: ESG, Financial Performances, Automotive sector, Sustainability*

### INTRODUCTION

In the last few decades, Environmental, Social and Governance (ESG) performance has emerged as an important aspect for developing sustainable strategies that affect overall firm performance (Eccles and

Serafeim, 2013). Also for automotive industry, sustainability has become a key competence to fight against climate change, resource efficiency and environmental degradation.

Actually, the automotive sector is under considerable pressure from governments and society to improve its ESG performances: regulations are becoming more and more stringent consumer preferences seem to favour electric vehicles.

In response, cars and components companies appear to be increasingly involved in the field of sustainability. Consequently, the concept of Corporate Social Responsibility appears to be an integral part of the DNA of car manufacturers. *“Innovation, responsibility, teamwork, and continuous improvement”* are core values enunciated by General Motors; *“to make this world a mobile, sustainable place with access to all the citizens”* is Volkswagen vision statement; *“Through our commitment to quality, constant innovation and respect for the planet”* Toyota clearly includes Corporate Social Responsibility in its vision statement.

If on the one hand it's obvious that ESG factors are important to the ongoing changes of companies in the automotive sector, on the other hand you have to wonder whether ESG-related performance are already and will continue to be a key factor in attracting capital and in economic viability.

On these statements, we develop a paper in order to study the effect of a responsible and ethical behaviour on the financial performance of automotive companies. The paper is structured as follow: after this introduction, the next section presents a literature review on ESG and financial performance, with the definition of different Research Hypothesis. In the third section, we define the methodologies. The main results of the descriptive analysis and the OLS analysis are in the section four. In the final section, we conclude the paper with some important considerations for future researches.

## 2. LITERATURE REVIEW

Sustainable investment has been the subject of academic research for several years.

In this paper, we want to expand the debate about how ESG parameters affects corporate financial performance.

According to this aim, some emerging research focuses on the study of ESG dimensions ' influence on accounting- based indicators, such as ROA, ROE or ROI; while others investigate the possible links between ESG measures and market-based indicators, such as Tobin's Q or market-to- book ratio.

In their meta-analysis of 52 studies, Orlitzky et al. (2003) conclude that Corporate Social Responsibility and Environmental Responsibility pay off in financial terms; moreover Corporate Social Performance appears to be more highly correlated with accounting-based measures of Corporate Financial Performance than with market-based indicators.

Similar results are also confirmed by Falck and Heblich (2007) who argue that “ company can ‘do well by doing good’; in other words, it can make a profit and make the world a better place at the same time”.

Eccles et al (2014) investigate the effect of corporate sustainability on organizational processes and performance, using a matched sample of 180 US companies. Results shows that High Sustainability companies - corporations that voluntarily adopted sustainability policies by 1993- significantly outperform Low Sustainability companies over the long-term, (earning higher return -amounting 2.3% to 4.8% per annum-) both in terms of stock market as well as accounting performance. Findings also suggest that High Sustainability firms benefit more in B2C sectors and in sectors based on natural resources production.

The study done by Friede et al (2015), based on looking at more than 2000 empirical studies since the 1970s, examines the relationship between ESG criteria and financial performance of companies, publishing their results on The Journal of Sustainable Finance & Investment. Specifically, the findings show that roughly 90% of studies find a non-negative ESG- CFP relation and in addition, the large majority of studies reports positive results. The positive ESG influence on Corporate Financial Performance appears stable over time.

Additionally, the G variable appears to have a greater impact on the financial indicators, with the highest proportion found; instead the positive relationship is weakest for the social factor.

Instead, MIT Sloan School of Management and Breckenridge Capital Advisors (2016) in his research reveals a strong intuitive relationship between ESG scores and core figures that express financial health, such as debt ratios and profitability.

Clark et al (2015) in their meta-study categorize more than 200 different sources (academic studies, industry reports, newspaper articles and books).

According to their findings, a remarkable correlation between diligent sustainability business practices and economic performance shown: 88% of reviewed sources find that companies with robust sustainability practices demonstrate better operational performance and 80% of the reviewed studies demonstrate that prudent sustainability practices have a positive influence on stock market performance.

Different are the benefits associated to the integration of ESG report on financial statements, including the reduction of agency costs, of political costs and of information asymmetries or better internal resource allocation decisions.

Despite this, some researchers disclose that additional costs of ESG reporting may have a negative impact on firms' financial performance.

Kalinowski (2014) argues that there is no clear correlation between ESG factors and stock market variables.

Daszynska- Zygadlo et al (2016), in their research based on sample data covering more than 2000 companies from all over the world, discover that consumer staples sector is sensitive to governance and environmental dimensions; social dimension is significant for financials and utilities sectors; instead healthcare and energy sector are influenced by environment initiatives.

However, other researchers, such as for instance Barnett (2007) and Soana (2011) claim that there is still a lack of studies focusing on one specific industry.

Despite the existence of a vast body of academic literature on the possible relationship between ESG and a firm's financial performance, the discussion is still open.

Studies clearly provide an incomplete picture: positive, negative as well as neutral relationship have been obtained.

"Results are ambiguous, inconclusive, or contradictory". (Aupperle et al 1985).

Environmental, social and governance dimensions seem to have variant impact on financial performance for several factors: different variables are used to measure financial performance as well as different methods are employed to represent the ESG rating. Likewise results vary with the industry, the country or company they explore (Alshehhi et al., 2018).

Nevertheless there come out mixed findings, the idea of a strong positive ESG matters influence on firm's financial performance seems to prevail in the economic literature, as highlighted by numerous reports in recent years.

Referring to each single ESG component, governance seems to be the most analyzed factor as well as the most relevant one.

Gompers et al (2003) construct a "Governance Index" to proxy for the level of shareholder rights at about 1500 large firms during the 1990s in order to analyze a possible link between corporate governance and long-term equity return, firm value and accounting measures of performance. Their results clearly illustrate that firms with stronger shareholder rights have higher firm value, higher net profit margin, higher sales growth, higher return on equity and lower capital expenditures, supporting the hypothesis that well-governed companies outperform their poorly governed counterparts.

Bauer et al (2004) analyze the impact of good corporate governance on stock returns, firm value and operating performance for about 300 firms in Europe in 2000 and 2001: a positive relationship appears between governance and firm value, but substantial differences are found between the UK market and the Eurozone markets. In particular, this link seems to be stronger in the Eurozone markets than in the UK due to the fact that Eurozone countries traditionally tend to have lower governance standards.

Few other researchers' paper focus on the influence of governance metrics on firm performance with regard to specific countries, such as Drobetz et al. (2004) for Germany, De Jong et al. (2001) for the Netherlands and Black (2002) for Russia. These studies generally reveal a positive relationship between governance standards and firm value. Furthermore comparing the findings of these papers , it is permissible to highlight that the relationship seems to be strengthened in countries with less developed standards.

On the basis of the literature reported, our research hypothesis are:

*H1a: There is a positive and statistically significant relationship between Governance factor and market performance (Book Value per Share and Leverage).*

*H1b: There is a positive and statistically significant relationship between Governance factor and firm market value (Enterprise value).*

*H1c: There is a positive and statistically significant relationship between Governance factor and firm accounting performance (ROE and ROA).*

Referring to environmental and social factors, researches have a shorter history.

Russo and Fouts (1997) find a positive and significant relation between environmental and the firm's return-on-assets ratio.

The study conducted by Galema et al (2008) discover that environmental dimension has positive impacts on market value.

Similarly, Derwall et al (2010), focusing on the concept of eco-efficiency and analyzing the relation between eco-efficiency and financial performance from 1997 to 2004, demonstrate that higher eco-efficiency relates positively to operating performance and market value.

Weber (2013) in his study conducted on the ESG reporting of China Top 100 Green Companies shows a positive link between corporate environmental performance and financial returns.

On these basis, our research hypothesis are:

*H2a: There is a positive and statistically significant relationship between Environmental factor and firm accounting (ROE and ROA).*

*H2b: There is a positive and statistically significant relationship between Environmental factor and firm market value (Enterprise value).*

*H2c: There is a positive and statistically significant relationship between Environmental factor and market performance (Book Value per Share and Leverage).*

As for Social dimension, the most important paper on the association between social issues and financial returns is Edmans, Li and Zhang (2017). To be specific , the research analyzes the relationship between employee satisfaction and long-run stock returns around the world. The obtained results illustrate that employee satisfaction, measured to lists of the " The best companies to work for" in 14

countries, is associated with positive abnormal returns, current valuation ratios and future profitability in countries with high labor market flexibility, such as the U.S. and U.K., but not in countries with rigid labor market, such as Germany.

Forget (2012) argues that good business behavior with customers and suppliers is linked to financial outperformance.

Chen, Feldmann & Tang (2015) illustrate a significant and positive correlation between corporate social performance (referring specifically to the categories of human rights, society and product responsibility) and return on equity.

AXA IM Rosenberg (2018) through his study based on data for the 1000 largest US companies over the period January 2005 – July 2017, clearly demonstrates how firms with higher diversity levels (with regards to gender diversity in board of director and evidence of foreign board members) are related with higher current as well as future profitability.

On these basis, our RHs are:

*H3: There is a positive and statistically significant relationship between Social factor and firm accounting performance (ROE and ROA)*

Accordingly, this paper aims to explore the impacts of each individual ESG dimensions on a firm's profitability.

After investigating these links, the research will focus on possible differences of results between the three selected countries- USA, Japan and Europe-.

Therefore, in a second step of the analysis, the same research hypothesis will be applied with reference to each individual country.

### **3. DATA & METHODOLOGY**

Renowned the noticeable importance of ESG factors to the ongoing changes of companies in the automotive sector, the aim of the paper is to wonder whether ESG-related performance are already and will continue to be a key factor in attracting capital and in economic viability in the industry.

More specifically, the object of the analysis is to verify a possible direct link between good environmental, social or governance performance and financial performance of listed companies in the car sector.

#### **3.1. SAMPLE**

In order to study the effect of a responsible and ethical behaviour on the companies' financial performance in the automotive sector (with specific reference to Auto Manufacturers; Recreational Vehicles and Auto Parts), the sample is composed of 28 listed firms.

In particular, the sample firms are selected based on:

- Firstly, the provenience of the companies. Specifically, we have selected samples of large-size cars and components firms from three leading automotive manufacturing Countries - Japan, United States and Europe (Germany, Italy and France, the dominant European cluster in the car industry)-.
- The second is the availability of annual reports on ESG score of the firms. More in detail, data on ESG performance are collected from Sustainalytics, a leading global provider of ESG and corporate governance products and services.
- The third is the availability of audited financial data, with reference to year 2018. In depth, reports and data of these dependent variables are available on the Yahoo Finance and Morningstar websites. Additionally, the reported monetary values are expressed in Euro.

Firm distribution by Country in the sample is shown in Table 3.

*Table 3.: The sample firms distribution in automotive sector*

| <b>Company</b>          | <b>Country</b> | <b>Net Revenue 2018</b> |
|-------------------------|----------------|-------------------------|
| Borgwarner INC          | United States  | 9.325,01                |
| BMW                     | Germany        | 97.480,00               |
| Bridgestone Corporation | Japan          | 29.833,66               |
| Continental AG          | Germany        | 44.404,40               |
| Daimler AG              | Germany        | 167.362,00              |
| Denso Corporation       | Japan          | 41.751,88               |
| Faurecia S.E.           | France         | 17.524,70               |
| Ferrari N.V.            | Italy          | 3.420,32                |
| Ford Motor Company      | United States  | 141.963,27              |
| General Motors          | United States  | 130.197,18              |
| Harley-Davidson INC     | United States  | 5.061,73                |
| Honda Motor CO LTD      | Japan          | 125.558,26              |
| Lear Corporation        | United States  | 18.729,11               |
| Mazda Motor Corporation | Japan          | 28.395,82               |
| Mitsubishi Motor Corp.  | Japan          | 17.920,05               |

**Table 3.: The sample firms distribution in automotive sector**

|                                    |               |            |
|------------------------------------|---------------|------------|
| Nissan Motor CO. LTD               | Japan         | 97.685,94  |
| Porsche Automobil Holding          | Germany       | 103,00     |
| Renault SA                         | France        | 57.419,00  |
| Schaeffler AG                      | Germany       | 14.241,00  |
| Subaru Corporation                 | Japan         | 27.833,44  |
| Suzuki Motor Corp.                 | Japan         | 30.710,59  |
| Tesla                              | United States | 19.006,10  |
| The Goodyear Tire & Rubber Company | United States | 13.704,66  |
| Toyota Motor Corporation           | Japan         | 240.140,94 |
| Valeo SA                           | France        | 19.124,00  |
| Volkswagen AG                      | Germany       | 235.849,00 |
| Yamaha Motor CO LTD                | Japan         | 13.675,81  |

**Data in Millions. Currency : EUR**  
**Source: Author's Calculation**

As illustrate in the table 3, the sample consists of 9 listed companies from Europe; 11 well-known firms from Japan and 7 firms from United States. Despite our country samples are small-size, they are a set of companies best involved in improving environmental, social and governance performance.

### 3.2. VARIABLES

In order to verify the existence of a link between extra-financial items and financial performance of listed firms in automotive sector, the dependent variables used in the regression analysis are:

Return on equity (ROE). This marker measures how effectively management is using a company's assets to create profits. It is calculated as the ratio between net income and the value of shareholders' equity.

$$ROE = \text{NetIncome}/\text{Equity}$$

Return on Assets (ROA). This parameter shows the percentage of profit a company earns in relation to its overall resources. It is commonly calculated as the ratio between net income and the value of the assets.

$$ROA = \text{NetIncome}/\text{TotalAssets}$$

Leverage. This important financial index assesses the ability of a company to meet its financial obligations. Specifically, a higher financial leverage ratio indicates that a company is using debt to finance its assets and operations. In particular, the research refers to Debt Ratio, calculated as total debt divided by total assets. It shows a company's ability to pay off its liabilities with its assets.

$$\text{DEBT RATIO} = \text{TotalLiabilities/TotalAssets}$$

Enterprise Value. It is one of the fundamental metrics used in business valuation: it expresses the measure of a company's total value. In its calculation, it includes the market capitalization of a company but also short-term and long-term debt as well as any cash on the company's balance sheet.

$$\text{ENTERPRISE VALUE} = \text{CommonShares+PreferredShares+MarketValueofDebt+MinorityInterest-CashandEquivalents}$$

Book Value for Share. It is a ratio used to compare a firm's common shareholder's equity to the number of shares outstanding. It is obtained by the ratio of the balance sheet value of equity divided by the number of ordinary shares outstanding. It is used in order to determine if a stock is undervalued or overvalued and it helps investors understand how a stock behaves.

$$\text{BOOK VALUE PER SHARE} = (\text{Stockholders' Equity-PreferredStock})/\text{AverageSharesOutstanding}$$

Meanwhile, referring to the explanatory variables, non-financial performance are measured by ESG risk indicators.

Specifically, ESG risk rating of each firm is composed of:

Environmental score. It is an index of corporate environmental sustainability, obtained by considering the company's behavior with regard to some important issues such as biodiversity impacts, gas emissions, air quality, energy management.

Social score. It is a measures of corporate social sustainability, built considering the company's focus on social issues, such as protection and safety of workers, working conditions, human capital development.

Governance score. It is a marker of corporate governance sustainability. It focuses on the qualitative aspects of governance, considering some principal factors, such as Board Structure, Compensation/Remuneration, Shareholder Rights, and Audit practices.

ESG rating scale is from 0-100 and it is categorized across five risk levels: negligible, low, medium, high and severe. These risk categories are absolute, meaning that different level of risks are comparable across all subindustries covered.

Businesses that gain high score are those that proactively manage ESG issues, improving their non financial performance.

With reference to research sample firms, Volkswagen (ESG score 42,4), Nissan (ESG score 36) and Tesla (ESG score 31,4) appear to be the most engaged companies on the front of sustainability, facing a high ESG risk.

### 3.3. RESEARCH MODEL

In order to verify the existence of a link between extra-financial items and financial performance of listed firms in automotive sector, the dependent variables used in the regression analysis are:

Return on equity (ROE). This marker measures how effectively management is using a company's assets to create profits. It is calculated as the ratio between net income and the value of shareholders' equity.

$$\text{ROE} = \text{NetIncome/Equity}$$

Return on Assets (ROA). This parameter shows the percentage of profit a company earns in relation to its overall resources. It is commonly calculated as the ratio between net income and the value of the assets.

$$\text{ROA} = \text{NetIncome/TotalAssets}$$

Leverage. This important financial index assesses the ability of a company to meet its financial obligations. Specifically, a higher financial leverage ratio indicates that a company is using debt to finance its assets and operations. In particular, the research refers to Debt Ratio, calculated as total debt divided by total assets. It shows a company's ability to pay off its liabilities with its assets.

$$\text{DEBT RATIO} = \text{TotalLiabilities/TotalAssets}$$

Enterprise Value. It is one of the fundamental metrics used in business valuation: it expresses the measure of a company's total value. In its calculation, it includes the market capitalization of a company but also short-term and long-term debt as well as any cash on the company's balance sheet.

$$\text{ENTERPRISE VALUE} = \text{CommonShares+PreferredShares+MarketValueofDebt+MinorityInterest-CashandEquivalents}$$

Book Value for Share. It is a ratio used to compare a firm's common shareholder's equity to the number of shares outstanding. It is obtained by the ratio of the balance sheet value of equity divided by the number of ordinary shares outstanding. It is used in order to determine if a stock is undervalued or overvalued and it helps investors understand how a stock behaves.

$$\text{BOOK VALUE PER SHARE} = (\text{Stockholders' Equity-PreferredStock})/\text{AverageSharesOutstanding}$$

Meanwhile, referring to the explanatory variables, non-financial performance are measured by ESG risk indicators.

Specifically, ESG risk rating of each firm is composed of:

Environmental score. It is an index of corporate environmental sustainability, obtained by considering the company's behavior with regard to some important issues such as biodiversity impacts, gas emissions, air quality, energy management.

Social score. It is a measures of corporate social sustainability, built considering the company's focus on social issues, such as protection and safety of workers, working conditions, human capital development.

Governance score. It is a marker of corporate governance sustainability. It focuses on the qualitative aspects of governance, considering some principal factors, such as Board Structure, Compensation/ Remuneration, Shareholder Rights, and Audit practices.

ESG rating scale is from 0-100 and it is categorized across five risk levels: negligible, low, medium, high and severe. These risk categories are absolute, meaning that different level of risks are comparable across all subindustries covered.

Businesses that gain high score are those that proactively manage ESG issues, improving their non financial performance.

With reference to research sample firms, Volkswagen (ESG score 42,4), Nissan (ESG score 36) and Tesla (ESG score 31,4) appear to be the most engaged companies on the front of sustainability, facing a high ESG risk.

#### **4. RESULTS**

The aim of the research paper is to investigate on the impact of each singular E-S-G dimensions on financial performance, referring to a sample of 28 firms from the three leading automotive manufacturing Countries/clusters (Japan, United States and Europe).

According to the goal, the main results of the statistical analysis are shown below.

From an overall assessment, Governance dimension seems to represent a value driver for firms in the car industry, followed by Environmental dimension.

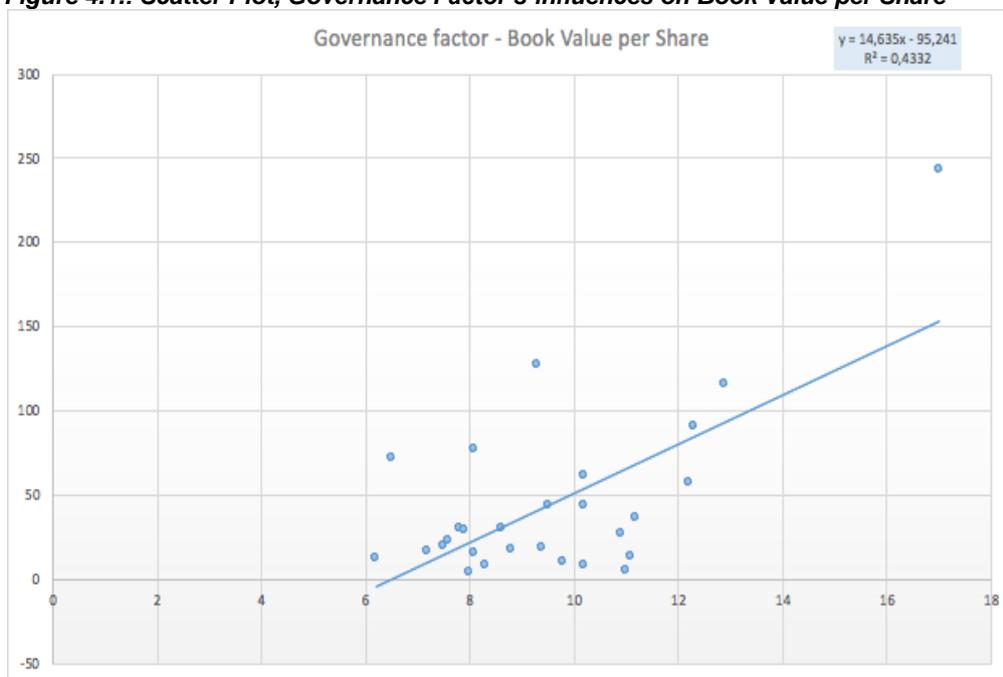

Conversely, Social factor appears to be negligible in affecting corporate financial performance.

To be accurate, the Table 1 shows some important evidences referring to the impact of G factor on firms market performance.

Table 1. Regression statistics results, Governance Factor - Firm Market Performance, automotive sector

|                   | Dependent variables  | $b_i$   | $R$    | $R^2$   | Significant P-value |
|-------------------|----------------------|---------|--------|---------|---------------------|
| Governance Factor | Leverage             | -0,0054 | 0,0082 | 0,00006 | 0,9666              |
|                   | Book Value for Share | 14,6348 | 0,6581 | 0,4332  | 0,000140            |

The H1a is partially confirmed. More in details, Governance factor seems to have no influence on Leverage: P-value equal to 0,966 and an R-squared of 0,0006 make the statistical model insignificant. In contrast, the regression analysis reveals a positive and statistically significant correlation between Book Value per Share and Governance Risk Index, with an  $R^2$  equal to 43,32%. The important level of significance, equal to 0,000140 validates the obtained model. Therefore if firms spend 1% more on governance issues, they would benefit in getting 14,6348 higher Book Value for Share.

**Figure 4.1.: Scatter Plot, Governance Factor's influences on Book Value per Share**

**Source: Author's calculation**

From a graphical analysis, a scatter plot above illustrates the relationship between Governance index and Book Value per Share. The distribution of firms around a positive inclined regression line, confirming statistical analysis.

Referring to the existence of a possible link between Governance factor and firms market value, findings are marked in the following table.

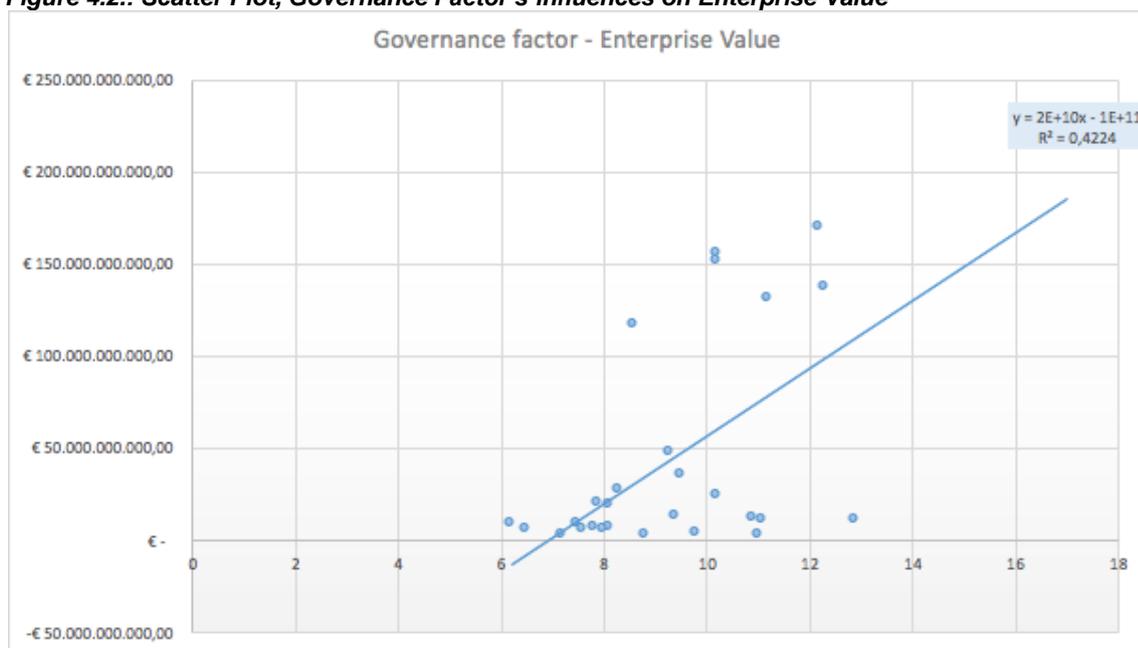

Table 2. Regression statistics results, Governance Factor - Firm Market Value, automotive sector

|                   | Dependent variables | $b_i$       | $R$    | $R^2$  | Significant P-value |
|-------------------|---------------------|-------------|--------|--------|---------------------|
| Governance Factor | Enterprise value    | 18383117901 | 0,6498 | 0,4223 | 0,00018             |

**Source: Author's calculation**

To be specific, Governance Index appears positively related with Enterprise Value. The R- squared of the model is equal to 42,23% and the important level of significance is equal to 0,00018, implying the model can explain the data relatively well. As firms become more responsible for a good Corporate Governance, their Enterprise Value increases.

**Figure 4.2.: Scatter Plot, Governance Factor's influences on Enterprise Value**

**Source: Author's calculation**

The graphical representation confirms the results of this analysis: the regression line turns out to have a positive slope; the various couple of values (Governance index- Enterprise Ratio) are distributed around the trend line.

The H1b is validated. According to Gompers et al (2003) firms with stronger shareholder rights have higher firm value.

Table 3 points the regression between Governance factor and firms accounting indicators.

Table 3. Regression statistics results, Governance Factor - Firm Accounting Performance, automotive sector

|                   | Dependent variables | $b_i$   | $R$    | $R^2$  | Significant P-value |
|-------------------|---------------------|---------|--------|--------|---------------------|
| Governance Factor | ROA                 | -0,4835 | 0,3036 | 0,0922 | 0,1161              |
|                   | ROE                 | -2,3689 | 0,3724 | 0,1386 | 0,0509              |

**Source: Author's calculation**

The Governance index is negatively correlated with Return on Equity. The weaknesses of this relation is highlighted by data:  $R^2$  equal to 13,86% and P-value equal to 0,0509.

Instead G dimension seems to be insignificant in explaining control variable ROA: indeed, by looking at results, the level of significance equal to 0,1161 and the R- squared equal to 0,0922 don't confirm the obtained model.

The third hypothesis H1c is not supported.

Referring to Environmental factor, Table 4 provides data about the influence of E dimension on firms accounting performance.

Table 4. Regression statistics results, Environmental Factor - Firm Accounting Performance, automotive sector

|                      | Dependent variables | $b_i$   | $R$    | $R^2$  | Significant P-value |
|----------------------|---------------------|---------|--------|--------|---------------------|
| Environmental Factor | ROA                 | -0,2554 | 0,1880 | 0,0353 | 0,3379              |
|                      | ROE                 | 0,0805  | 0,0148 | 0,0002 | 0,9402              |

**Source: Author's calculation**

The research hypothesis H2a is not confirmed. The analysis illustrates an insignificant correlation between Environmental index and accounting marks, ROE- ROA, with a higher P-value, equal to 0,9402 and 0,3379 respectively.

An increased focus on Environmental variable seems to have no effect on firms accounting performance.

In terms of long-term performance (Enterprise Value), the main results are shown in table 5.

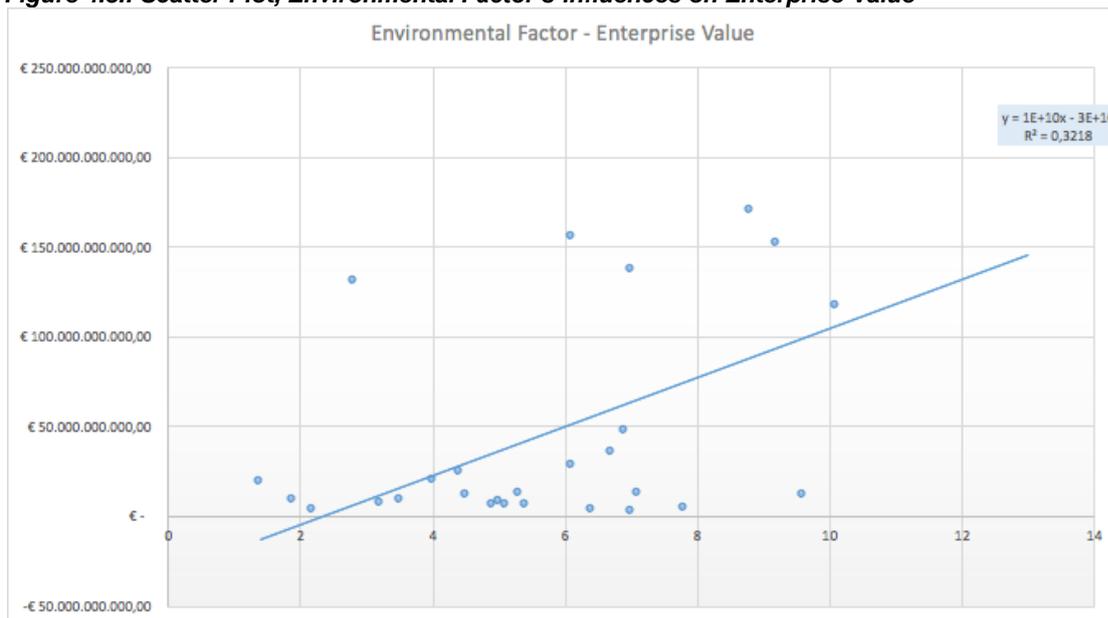

Table 5. Regression statistics results, Environmental Factor - Firm Market Value, automotive sector

|                      | Dependent variables | $b_i$       | $R$    | $R^2$  | Significant P-value |
|----------------------|---------------------|-------------|--------|--------|---------------------|
| Environmental Factor | Enterprise value    | 13692088517 | 0,5672 | 0,3217 | 0,0016              |

**Source: Author's calculation**

Specifically, the Environmental Risk variable has a positive relationship with the control variable Enterprise Value. The important level of significance, equal to 0.0016, validates the obtained model. A greater attention to the Environmental factor positively influences the value of firms, increasing it.

**Figure 4.3.: Scatter Plot, Environmental Factor's influences on Enterprise Value**

**Source: Author's calculation**

The obtained result is also summarized in Figure 4.3. The regression line is inclined positively, which means that as the commitment to the E factor increases, the Enterprise Value generally tends to increase.

Even if the correlation is not particularly strong, with an R-squared equal to 32.17% , the finding definitely confirms the research hypothesis H2b.

The regression analyses conducted between Environmental factor and Market Performance variables, Leverage and Book Value for Share, leads to the following result:

Table 6. Regression statistics results, Environmental Factor - Firm Market Performance, automotive sector

|                      | Dependent variables  | $b_i$  | $R$    | $R^2$  | Significant P-value |
|----------------------|----------------------|--------|--------|--------|---------------------|
| Environmental Factor | Leverage             | 0,1320 | 0,2357 | 0,0555 | 0,2272              |
|                      | Book Value per Share | 6,7522 | 0,3558 | 0,1266 | 0,0630              |

**Source: Author's calculation**

The research hypothesis H2c can be partially accepted. In particular, the findings highlight a positive link between Environmental Dimension and Book value per Share, even if the value of the correlation is of little significance, with an R-squared equal to 12.66. However, a P-value of 0.0630 validates the model.

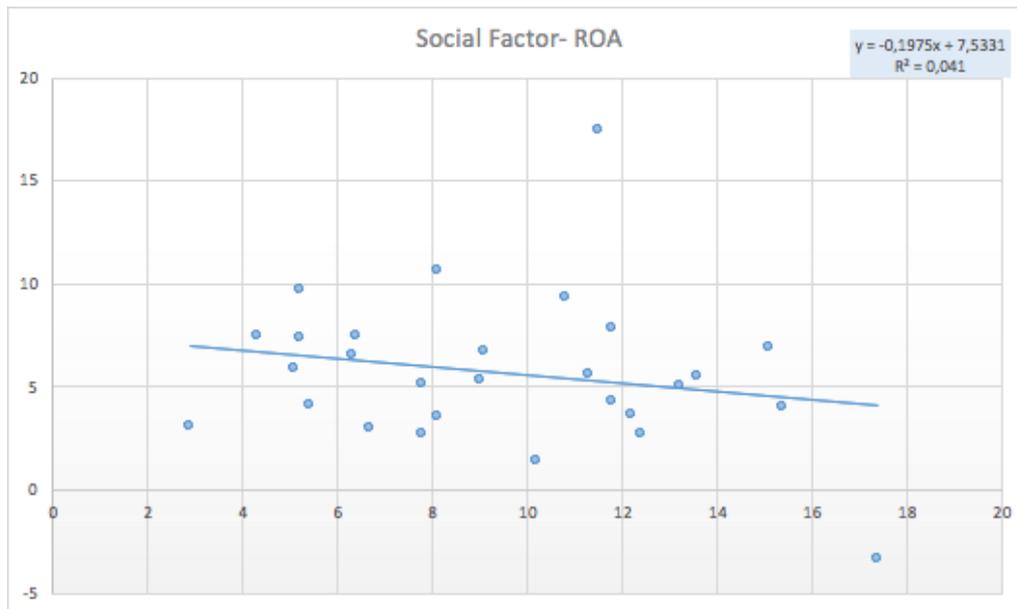

In contrast, referring to the dependent variable Leverage, the analysis substantially loses any statistical significance: the Environmental index is completely uncorrelated with Leverage ratio, as shown by looking data (R-squared of 5.55% and P-value of 0.2272).

For the test of the last research hypothesis H3, the table 7 gives a summary of the main findings.

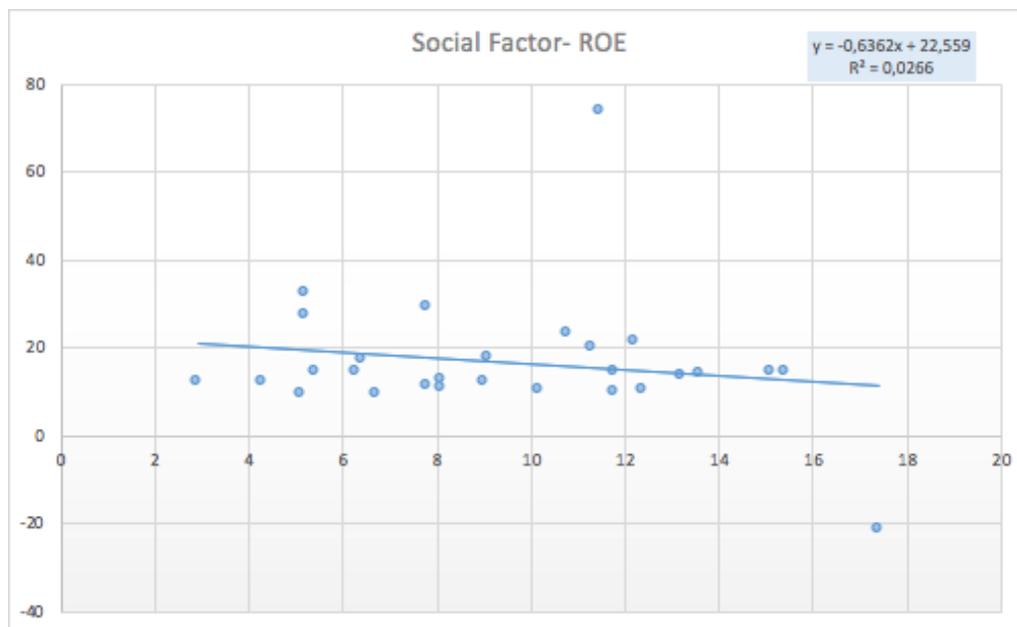

Table 7. Regression statistics results, Social Factor - Firm Accounting Performance, automotive sector

|               | Dependent variables | $b_i$   | $R$    | $R^2$  | Significant P-value |
|---------------|---------------------|---------|--------|--------|---------------------|
| Social Factor | ROA                 | -0,1974 | 0,2023 | 0,0409 | 0,3016              |
|               | ROE                 | -0,6361 | 0,1632 | 0,0266 | 0,4066              |

Referring to social dimension the absence of any correlation with ROE and ROA is evident by examining data: R-squared is between 2% and 4%, in addition the P-value, equal to 0,4066 and 0,3016 respectively, is insignificant in both regressions.

**Source: Author's calculation**

**Source: Author's calculation**

The graphical representations below confirm the obtained results: to be specific, the regression line appears flat (only slightly inclined, with R-squared of just 0.02 and 0.04 respectively.) It means that social dimension has no influence on firms accounting performance: the research hypothesis H3 isn't confirmed in automotive industry.

## 5. CONCLUSIONS, LIMITATIONS AND FUTURE DIRECTION

Different scholars (Eccles and Serafeim, 2013; Waddock and Graves, 1997; Surroca et al., 2010) underline that Economic Social and Governance performance has emerged as an important characteristic for competitive advantages and sustainable overall firm performance.

In the last few years, the number of studies increased. In particular, some emerging research focuses on the study of ESG dimensions influence on financial performance (accounting- based indicators and market-based indicators).

Even if the literature review is increasing, there is still a lack of studies focusing on one specific industry.

We present a research concerning the effect of a responsible and ethical behaviour on the financial performance of automotive companies.

The results are not clear. In fact, some hypotheses were confirmed but others rejected.

However, these are preliminary results of a more complex research. Limitations are linked to the small sample and with the firms' heterogeneity. Moreover, in a future research we want to analyse the relationship between an ESG indicator and economic and financial performances.

# INFLUENCE OF INTANGIBLE RESOURCES ON COMPETITIVE ADVANTAGE: EMPIRICAL STUDY OF PORTUGUESE TEXTILE INDUSTRY SMES

Rua, Orlando Lima

CEOS.PP / ISCAP / Polytechnic of Porto, Porto, Portugal

## ABSTRACT

The purpose of this paper is to analyse the influence of intangible resources on export performance.

The authors use a qualitative research approach by conducting a quantitative study based on survey data from 247 Portuguese small and medium-sized enterprises (SMEs) from the textile industry. Findings suggest that intangible resources has a positive and significant influence on competitive advantage, either by cost leadership or differentiation.

This paper presents further evidences of the strategies that SMEs managers should pursue and policy makers should promote. We conclude that globally intangible resources have a positive and significant impact on competitive advantage, either cost leadership or differentiation.

Finally, this study deepens our understanding and provides novel insights into strategic management literature, since it combines multiple factors and has obtained the importance of each construct in SMEs business growth.

*Keywords: intangible resources, competitive advantage, differentiation, cost, textile industry, SMEs, PLS-SEM.*

## INTRODUCTION

Exploring intangible resources among SMEs has inherent scholarly value, since these firms tend to be constrained in their tangible assets; possessing intangible resources take on particular strategic significance and can form the basis for competitive advantage (Anderson & Eshima, 2013).

Resource-based scholars argue that resources form the basis of firm strategies (Barney, 1991) and intangible resources are more likely than tangible resources to produce a competitive advantage, since they are often rare and socially complex, thereby making them difficult to imitate (Hitt, Bierman, Shimizu, & Kochhar, 2001). Thus, intangible assets are considered strategic variables (Amit & Schoemaker, 1993) and can consequently create sustainable value. Firms with valuable, scarce, and

nonsubstitutable resources can gain at least temporary advantages by using those resources to develop and implement product-market strategies (Hsu & Ziedonis, 2013).

So, the purpose of this paper is to broad the boundaries of and strategic management literature and test the following research question: — *Does intangible resources positively influence small business competitive strategies, either by cost leadership or differentiation?*

## **THEORETICAL FRAMEWORK**

### *Intangible resources*

There is a consensus in the literature that the source of competitive advantage is much more associated with intangible resources, since these are scarcer and socially complex, making their imitation difficult (Barney, 1991; Hitt et al., 2001). Consequently, intangible resources are considered strategic resources (Amit & Schoemaker, 1993).

Intangibles have three interesting features that distinguish them from tangible resources (Molloy et al., 2011). First, intangibles do not deplete or deteriorate with use, conferring benefits for an undefined period of time, contrasting with tangible resources, which have expected depreciation (Cohen, 2005). Second, multiple managers can simultaneously use intangibles. For example, the brand is available for use to all managers. Finally, intangibles are immaterial, which makes them difficult to exchange and cannot be separated from their owner. Indeed, to get hold of a brand, firms must often acquire the entire organization (Marr & Roos, 2005).

Empirical research identified six types of resources that are particularly important sources of competitive advantage, especially in international ventures: reputational resources; access to financial resources; human resources; cultural resources; relational resources; and informational (knowledge) resources (Morgan, Vorhies, & Schlegelmilch, 2006).

Intangible resources are based upon knowledge or information, such as organisational culture, product reputation, firm's brand, their abilities are unlimited (Pearson, Pitfield, & Ryley, 2015), having a much broader range of use in international markets (Fernández-Olmos & Díez-Vial, 2015).

### *Competitive advantage*

The increased intensity of business competition has forced firms to adopt a non-traditional management techniques and tools. Maintaining competitive advantage is a dynamic and infinite activity (Hung, Yang & Lien, 2010).

How firms achieve and sustain competitive advantage? This is the fundamental question in the field of strategic management (Teece et al., 1997). Porter (1985) considers simply a matter of creating value for customers and doing it better than competition.

Porter's model to classify firm strategies remains the most commonly supported and acknowledged framework in strategic management literature (Allen et al., 2006). Porter proposed four competitive strategies: broad cost leadership, broad differentiation, cost focus and differentiation focus. While cost leadership or differentiation is defined as dominant competitive strategies, focus is not a standalone strategy and "is not sufficient for above-average performance" (Porter, 1985, p. 15). Consequently, there is a tendency in the literature to recognise two main sources of competitive advantage: a) cost leadership – reaching lower costs than competitors and b) differentiation – creating more value for customers than the average firm (Lechner & Gudmundsson, 2014). Furthermore, and according to Porter, the two logics of differentiation and cost leadership are incompatible.

Hence, we can reduce the study of competitive strategy to differentiation and cost leadership, especially if the competitive strategy is related to other strategic elements of firm's behaviour. Differentiation means to fulfil customers' needs in a unique way, based on speed, customer service and flexibility, which is consistent with innovative approaches and characteristics of entrepreneurial firms. Cost leadership requires substantial financial resources (to invest in tangible assets), is based on process innovation, learning curve benefits, economies of scale and standardization, and seems to be less appropriate for small firms, given the resource constraints (Lechner & Gudmundsson, 2014).

Sustainable competitive advantage represents firm's competitive maintenance on the long run, whose performance is above average, resisting the dynamic evolution of competition, consumers and industry (e.g. Amit & Schoemaker, 1993; Peteraf, 1993; Porter, 1985).

#### *Hypotheses derivation*

RBV argues that competitive advantages are obtained from firms' resources based on two assumptions: 1) strategic resources are heterogeneously distributed across firms; and 2) these differences are stable overtime (Barney, 1991). Barney (1995, p. 66) suggested that, in order to create sustained competitive advantage and discover unique resources and capabilities, "managers must look inside their firm for valuable, rare and costly-to-imitate resources, and then exploit these resources through their organization". Peteraf (1993) considers resources to be the cornerstone of competitive advantage.

*H1*: Intangible resources are positively associated with cost leadership.

*H2*: Intangible resources are positively associated with differentiation.

## METHOD

### *Sample and data collection*

The population of this empirical study has been drawn from Portuguese textile industry firms. Questionnaires were used as primary data sources and were carried out over the period of February 16 to April 30, 2016. The identification of companies was done through the Portugal's Textile Association (Associação Têxtil de Portugal – ATP) database. So, in this study we use a non-probabilistic and convenient sampling.

A total of 247 complete and validated questionnaires accounting for 25% per cent of the population were obtained. This response rate is considered quite satisfactory, given that the average of top management survey response rates are in the range of 15%-20% (Menon & Bharadwaj, 1999).

### *Statistical analysis*

We used PLS-SEM path modelling to test our hypothesis, specifically the software SmartPLS 3.0 (Hair et al., 2013; Sarstedt et al., 2014). We believe that the PLS-SEM path modelling is best suited to estimate our research model since: 1) this study focuses on prediction and explanation of constructs variance (in our case 2: intangible resources and competitive advantage); 2) our research model has a complex structure; 3) the relationship between intangible resources and competitive advantage; 4) this study uses first and second-order reflective constructs; and 5) the sample (n=247).

### *Measures*

This study uses well-validated scales from previous studies to operationalize the key constructs and adapted them to the particular context of our empirical setting.

Independent variable – Following Morgan et al. (2006), in the intangible resources construct we included six dimensions: reputational resources; access to financial resources; human resources; cultural resources; relational resources; and informational resources.

Dependent variable – Competitive strategy was measured through two dimensions, differentiation and cost leadership, using Morgan et al. (2004) scale.

For intangible resources and competitive advantage, the decision-makers were asked to assess the relative position of their firm vis-à-vis their competitors. All constructs were assessed on a five-point Likert scale.

## RESULTS

### *Non-response bias and common method bias*

In this study we performed a univariate test of significance (*t*-test), to examine existing differences between respondents who answered our questionnaire quickly and those who did not. The results ( $p < 0.05$ ) showed the absence of significant differences between the two groups of respondents. Hence, we can assure that our sample is free from non-response bias. The methods used to reduce the risk of common method-bias were several. In the survey design itself, already validated in previous investigations, short and concise items were used to reduce misunderstandings. A pre-test was conducted to a group of several university experts and business specialists. Similarly, following the recommendation of Podsakoff et al. (2003), a distribution of items of dependent and non-consecutive independent variables was used. Finally, before assessing the relationships between dependent and independent variables, Harman's single-factor test was performed. Unrotated factor analysis using the eigenvalue-greater-than-one criterion revealed six factors, the first explaining 17.0 percent of the variance. This suggests that common method bias is not a serious threat to the validity of our study.

Next, in order to analyse and interpret the PLS-SEM results, we will: 1) assess the measurement model; and 2) evaluate and test the structural model.

### *Evaluation of measurement model*

Results from Table 1 show that the measurement model meets all general requirements. First, all reflective items have a load higher than 0.707, which means that the reliability of individual indicators (loading<sup>2</sup>) are higher than 0.5. Second, all composite reliability values and Cronbach's alpha values are higher than 0.70, suggesting acceptable model reliability. Third, the average variance extracted (AVE) values of all constructs are higher than 0.50, indicating an adequate convergent validity and implying that our set of indicators represent the same underlying construct (Hair et al., 2013).

| First-order constructs | Items | Factor loading |                           | Cronbach's Alpha | Composite reliability | AVE   |
|------------------------|-------|----------------|---------------------------|------------------|-----------------------|-------|
|                        |       |                | Item loading <sup>2</sup> |                  |                       |       |
| INTANGIBLE RESOURCES   |       |                |                           |                  |                       |       |
|                        | REP1  | 0.928          | 0.861                     |                  |                       |       |
| Reputational resources | REP2  | 0.915          | 0.837                     | 0.905            | 0.934                 | 0.779 |
|                        | REP3  | 0.847          | 0.717                     |                  |                       |       |
|                        | REP4  | 0.835          | 0.697                     |                  |                       |       |
|                        | FIN1  | 0.940          | 0.884                     |                  |                       |       |

Table 1. *Measurement model*

Finally, regarding discriminant validity, this paper presents two necessary approaches: 1) the first approach suggests that the AVE should share more variance with its assigned indicators than with any other construct - Fornell-Larcker criterion (Fornell & Larcker, 1981); and 2) the second approach suggests that no item should have a higher factor load with another construct than with the one which is assign to measure. The results shown in Table 2 confirm the existence of discriminant validity in our study.

| Dimension                  | 1.   | 2.   | 3.   | 4.   | 5.   | 6.   | 7. | 8. | 9. |
|----------------------------|------|------|------|------|------|------|----|----|----|
| 1. Cost                    | .878 |      |      |      |      |      |    |    |    |
| 2. Cultural resources      | .260 | .906 |      |      |      |      |    |    |    |
| 3. Financial resources     | .670 | .511 | .950 |      |      |      |    |    |    |
| 4. Human resources         | .373 | .810 | .636 | .912 |      |      |    |    |    |
| 5. Informational resources | .480 | .557 | .496 | .666 | .857 |      |    |    |    |
| 6. Product                 | .303 | .711 | .485 | .731 | .524 | .902 |    |    |    |

|                           |      |      |      |      |      |      |      |      |      |
|---------------------------|------|------|------|------|------|------|------|------|------|
| 7. Relational resources   | .447 | .698 | .622 | .715 | .606 | .649 | .934 |      |      |
| 8. Reputational resources | .404 | .639 | .589 | .660 | .459 | .789 | .656 | .882 |      |
| 9. Service                | .319 | .502 | .465 | .589 | .540 | .814 | .599 | .555 | .864 |

Table 2. *Latent constructs correlation (Fornell-Larcker Criterion)**Evaluation of structural model*

Once the measurement model is defined and validated in all its components, we will proceed and create the second order model, following previous research (e.g. Zahra & Garvis, 2000), where the latent variables of the measurement model behave as constructs' measurement variables. Specifically, Intangible Resources (reputational, financial, human, cultural, relational and informational resources), Competitive Advantage-Cost and Competitive Advantage-Differentiation (product and service).

In the following tables 3 and 4, we present the results of reliability, convergent validity and discriminant validity corresponding to the second order model. All data confirm the strength of our model.

| Construct/<br>Dimension                      | Cronbach's<br>Alpha | Composite<br>Reliability | AVE  |
|--|---------------------|--------------------------|------|
| 1. Intangible resources                      | .963                | .929                     | .687 |
| 2. Competitive advantage-<br>differentiation | .940                | .951                     | .907 |
| 3. Competitive advantage-cost                | .901                | .927                     | .761 |

Table 3. *Convergence validity and reliability indexes of the second-order model*

| Construct/Dimension                          | 1.   | 2.   | 3.   |
|--|------|------|------|
| 1. Intangible resources                      | .829 |      |      |
| 2. Competitive advantage-<br>differentiation | .726 | .952 |      |
| 3. Competitive advantage-cost                | .535 | .326 | .873 |

Table 4. *Discriminant validity index of the second-order model*

Results from Table 5, regarding the effect of intangible resources on firms' competitive strategies, remarkably our findings confirm that the possession of intangible resources influences the development of both cost leadership and differentiation (product or service). That is, the possession of reputational, financial, human, cultural, and relational and information resources support competitive strategies design by firms. According to statistical data, these intangible resources are more significant on differentiation ( $\beta=0.723$ ;  $p$ -value $<0.001$ ), confirming H2. Similarly, H1 is also supported by the model ( $\beta=0.525$ ;  $p$ -value $<0.001$ ).

| Hypotheses    | Original<br>Sample (O) | T<br>Statistics<br>( O/STDEV ) | p<br>values | 2.5%  | 97.5% | Results   |
|---------------|------------------------|--------------------------------|-------------|-------|-------|-----------|
| H1. IR -> CAC | 0.525                  | 10.917                         | 0.001*      | 0.428 | 0.614 | Supported |
| H2. IR -> CAD | 0.723                  | 17.448                         | 0.001*      | 0.634 | 0.797 | Supported |

## DISCUSSION AND CONCLUSIONS

The main purpose of this study was to analyse the influence of intangible resources on competitive advantage. The central context of this research is on SMEs, which constitute the vast majority of firms in Portugal, as in most world economies. Thus, we conducted an empirical research based on a sample of 247 firms, which were applied a questionnaire in order to exploit data to test hypothesis, using proceedings and statistical techniques.

Newbert (2007) argues that, because of their rareness, intangible resources are critical to gain competitive advantage and its ownership is an important factor in the SMEs ability to implement strategies that lead to superior performance. On this point, we conclude that globally intangible resources have a positive and significant impact on competitive advantage, either cost leadership or differentiation (H1 and H2 supported). This is due to the fact that these resources are valuable, rare and inimitable, and are dully organized to be converted into competitive advantage (Barney, 1995), which is why they are considered the cornerstone of competitive advantage (Peteraf, 1993), and are taken into consideration in the development and implementation of product-market strategies (Hsu & Ziedonis, 2013). Thus, this study demonstrated that the firms' intangible resources has a positive and significant influence on their competitive advantage.

As reported by the ATP (2014), globalization pressures, such as textile trade liberalization, have considerably affected the industry. The textile sector is being subjected to strong pressures in a fast-changing business environment due to market volatility and strong competition world-wide. The key success factors of the industry are related primarily with cost (labour, energy, transport), but also with geographical location (flexibility, responsiveness, proximity service), knowledge (know-how, experience, technical expertise, research and development, networking) and recognition (tradition, brands, quality). Therefore, we acknowledge that the sector is developing strong differentiation factors. Firms in these mature markets must look for ways to stay competitive and develop strategies that enables them to differentiate themselves from other firms.

We highlight the contribution of this study to the theory of strategic management. It is known that strategy includes deliberate and emergent initiatives adopted by management, comprising resource and capabilities used to improve business performance (Nag, Hambrick, & Chen, 2007). In order to remain competitive, firms must assess which strategic determinants give them an advantage over their competitors. The findings are a contribution to clarify the influence of intangible resources in small firms export performance.

Additionally, our findings provide guidance to business practitioners, since they indicate that intangible resources is predictor of competitive strategies and performance. The research has also shown the positive influences of generic strategies on firm performance. So, for small firm managers, competitive strategy does matters and the development of one type of competitive advantage, alongside with firm's resources, is a major performance driver.

The study is not without its limitations. The fact that the research does not consider the effect of control variables such as age, location and target market of the respondents can be seen as a limitation. Finally, the fact that the sampling is non probabilistic and convenience is a limitation. Therefore, we advise prudence in the generalization of results.

Firstly, this study has been based on a mature sector, as is the textile sector in Portugal. The results obtained should be understood in this context. For this reason, new research could be done in more modern industries to test again the proposed relations. Second, given the irregular nature of business growth, a snapshot survey may not be able to capture strategy and performance variations over long periods of time. As such, further studies with a longitudinal perspective would be of added value to investigate why these differences persist. In other words, to find how and why some small exporters become highly successful while others, in the same industry, struggle to raise their export strengths.

## **ABSORPTIVE CAPABILITIES AND EXPORT PERFORMANCE: WHAT IS THE CONNECTION?**

**Rua, Orlando Lima**

CEOS.PP / ISCAP / Polytechnic of Porto, Porto, Portugal

### **ABSTRACT**

The purpose of this paper is to analyse the influence of absorptive capabilities on export performance.

The authors use a quantitative research approach by conducting a study based on survey data from 247 Portuguese small and medium-sized enterprises (SMEs) from the textile industry. Findings suggest that absorptive capabilities has a positive and significant influence on export performance.

This paper presents further evidences of the strategies that SMEs managers should pursue and policy makers should promote. This study demonstrated that the firms' absorptive capabilities has a positive and significant influence on export performance and deepens our understanding and provides novel insights into strategic management literature, since it combines multiple factors and has obtained the importance of each construct in SMEs business growth.

*Keywords: absorptive capabilities, export performance, textile industry, SMEs, PLS-SEM.*

### **INTRODUCTION**

This study aims to analyse the influence of absorptive capabilities on export performance.

Firms may possess resources but must display dynamic capabilities otherwise shareholder value will be destroyed (Bowman & Ambrosini, 2003). It is in this context that emerges the Dynamic Capabilities View (DCV) (Amit & Schoemaker, 1993; Teece, Pisano & Shuen, 1997) to support the adjustment to environmental change. The literature suggests that resources and capabilities are related to each other (Dhanaraj & Beamish, 2003; Morgan, Kaleka & Katsikeas, 2004). Integration, reconfiguration and learning resources only become significant when resources are abundant (Wu & Wang, 2007), thus improving firms' dynamic capabilities. Monteiro, Soares and Rua (2017) defend that in versatile markets, firms' capabilities should be dynamic and managers must display the ability to ensure consistency between business environment and strategy in order to continuously renew skills.

Our study is responsive to the call of Sousa, Martínez-López and Coelho (2008) which suggests that, in

the context of international markets, firms' survival and expansion, and consequent economic growth of many countries, is strongly dependent on a better understanding of the determinants that influence export performance. In fact, the factors that set off SME growth (including exporting) are still in need of research (Stouraitis et al., 2017). So, the purpose of this paper is to broaden the boundaries of strategic management literature and test the following research question: — *Does absorptive capabilities positively influence small business export performance?*

## **THEORETICAL FRAMEWORK**

### *Absorptive capabilities*

Cohen and Levinthal (1990) presented a definition of ACAP most widely cited by academic research, as the firm's ability to identify, assimilate and exploit new knowledge. Thus, this ability access and use new external knowledge, regarded as an intangible asset, is critical to success and depends mainly on prior knowledge level, since it is this knowledge that will facilitate the identification and processing of new one. This prior knowledge not only includes the basic capabilities, such as shared language, but also recent technological and scientific data or learning skills. By analysing this definition is found that absorptive capability of knowledge only three dimensions: the ability to acquire external knowledge; the ability to assimilate it inside; and the ability to apply it.

Zahra and George (2002) divided ACAP in Potential Absorptive Capability (PACAP) and Realized Absorptive Capability (RACAP). PACAP reflects the firms' ability to acquire and assimilate knowledge that is vital for their activities. Knowledge identification, acquisition and assimilation is related to routines and processes that permit to analyse, process, interpret and understand external information. RACAP includes knowledge transformation and exploitation, where transformation is the ability to develop routines that facilitate the integration of newly acquired knowledge in existing one. Knowledge exploitation are routines which enhance existing skills or create new ones by incorporating acquired and transformed knowledge internally.

In order to cope and enhance each ACAP dimension, Jansen, Van Den Bosch and Volberda (2005) argue that firms need to develop organizational mechanisms which enable them to synthesize and apply newly acquired knowledge. Thus, there are coordination mechanisms that increase the exchange of knowledge between sectors and hierarchies, like multitasking teams, participation in decision-making and job rotation. These mechanisms bring together different sources of expertise and increase lateral interaction between functional areas. System mechanisms are behaviour programs that reduce established deviations, such as routines and formalization. Socialization mechanisms create a broad and tacit understanding of appropriate rules of action, contributing to a common code of

communication.

### *Export performance*

Literature on export performance is extensive but arguably it has not yet achieved the consensus required to prescribe exporting strategies to small firm (Casey & Hamilton, 2014). Exporting is an early phase in the internationalisation model established by Johanson and Vahlne (1977, 2009), grounded on the assumption that new exporters can gradually engage with foreign markets, depending their exploitation strategy on knowledge and other resources. This export research, however, was not pertinent for small exporters (Casey & Hamilton, 2014), since its unit of analysis was large firms.

In a fairly recent literature review, Sousa et al. (2008) conclude that, along with internal capabilities and competencies, the main determinants of export performance are firm size and international experience. Actually, internationalization processes have mainly been studied with reference to multinational corporations and less for SMEs, because smallness is usually considered a problem, as these firms often have a disadvantage in resource access (Musso & Francioni, 2014). This, however, does not support small firm managers in search of a growth strategy through exporting.

Conversely, the number of small firms operating in international markets has increased and represents the majority of firms in most countries, and therefore, they play an important role in the economic growth of their countries. As a consequence, the internationalization process of SMEs has become a topic of academic and governmental attention (Musso & Francioni, 2014).

Hence, the development of exports is of great importance, both at macro and micro levels. Exporting contributes to economic and social development of nations, helps the industry progress, increases productivity and creates jobs. At firms level, through market diversification, exports provide an opportunity for them to become less dependent on the domestic market, gaining new customers, exploiting economies of scale and achieving lower production costs while producing more efficiently (Okpara, 2009).

Exports is a more attractive way to enter international markets, especially for SMEs, in comparison with other alternatives, such as joint ventures, which involve spending a large number of resources (Dhanaraj & Beamish, 2003; Fuchs & Köstner, 2016; Piercy, Kaleka & Katsikeas, 1998), does not create high risk and commitment and allows greater flexibility in adjusting the volume of goods to different export markets (Lu & Beamish, 2002).

On one hand, export activity fulfils certain business goals, which may be economic (such as increasing profits and sales) and/or strategic (such as diversification of markets, gaining market share and

increasing brand reputation) (Cavusgil & Zou, 1994). On the other hand, export motivation may result from proactive or reactive actions. For example, proactive actions are advantage of profit, introduction of a single product, technological advantage, exclusive information, commitment of management, tax benefits and economies of scale. Reactive motivations are identifying competitive pressures, excess production capacity, sales decrease or saturation in the domestic market and proximity of customers and landing ports (Stouraitis et al., 2017; Wood & Robertson, 1997).

#### *Hypothesis derivation*

Teece *et al.* (1997, p. 516) defined dynamic capabilities as the “firm’s ability to integrate, build, and reconfigure internal and external competences to address rapidly changing environments”. Dynamic capabilities thus reflect firms’ ability to achieve new and innovative export forms. ACAP is a dynamic capability found in organizational processes that enables firms to reconfigure their core resources, react to environmental dynamics and build competitive advantage (Zahra & George, 2002). The heterogeneity of resources and capabilities leads to performance imbalances and affects firms’ ability to design and implement competitive strategies (Barney, 1991; Peteraf, 1993). Thus, this theory suggests that heterogeneous resources and capabilities have a direct effect on firms’ performance (Makadok, 2001; Teece et al., 1997). Thus, we tested the following hypothesis:

*H1: Absorptive capabilities influences positively with export performance.*

## **METHODOLOGY**

### *Sample and data collection*

The population of this empirical study has been drawn from Portuguese textile industry firms. Questionnaires were used as primary data sources and were carried out over the period of February 16 to April 30, 2016. The identification of companies was done through the Portugal’s Textile Association (Associação Têxtil de Portugal) database (ATP, 2014). So, in this study we use a non-probabilistic and convenient sampling.

A total of 247 complete and validated questionnaires accounting for 25% per cent of the population were obtained. This response rate is considered quite satisfactory, given that the average of top management survey response rates are in the range of 15%-20% (Menon & Bharadwaj, 1999).

### *Statistical analysis*

We used PLS-SEM path modelling to test our hypothesis, specifically the software SmartPLS 3.0 (Hair et al., 2013; Sarstedt et al., 2014). We believe that the PLS-SEM path modelling is best suited to estimate our research model since: (1) this study focuses on prediction and explanation of constructs variance

(in our case 2), (2) our research model has a complex structure, (3) the relationship between absorptive capabilities and export performance, (4) this study uses first and second-order reflective constructs and (5) the sample (n=247).

### *Measures*

This study uses well-validated scales from previous studies to operationalize the key constructs and adapted them to the particular context of our empirical setting.

Independent variable - According to Zahra and George (2002), ACAP construct is divided in Potential Absorptive capabilities (PACAP) e Realized Absorptive capabilities (RACAP). To measure this construct we use Jansen et al.'s (2005) scale.

Dependent variable – This construct was measured using Okpara's (2009) measurement instrument.

All constructs were assessed on a five-point Likert scale.

## **RESULTS**

### *Non-response bias and common method bias*

In this study we performed a univariate test of significance (*t*-test), to examine existing differences between respondents who answered our questionnaire quickly and those who did not. The results ( $p < 0.05$ ) showed the absence of significant differences between the two groups of respondents. Hence, we can assure that our sample is free from non-response bias. The methods used to reduce the risk of common method-bias were several. In the survey design itself, already validated in previous investigations, short and concise items were used to reduce misunderstandings. A pre-test was conducted to a group of several university experts and business specialists. Similarly, following the recommendation of Podsakoff et al. (2003), a distribution of items of dependent and non-consecutive independent variables was used. Finally, before assessing the relationships between dependent and independent variables, Harman's single-factor test was performed. Unrotated factor analysis using the eigenvalue-greater-than-one criterion revealed six factors, the first explaining 17.0 percent of the variance. This suggests that common method bias is not a serious threat to the validity of our study. Next, in order to analyse and interpret the PLS-SEM results, we will: (1) assess the measurement model and (2) evaluate and test the structural model.

### *Evaluation of measurement model*

Results from Table 1 show that the measurement model meets all general requirements. First, all reflective items have a load higher than 0.707, which means that the reliability of individual indicators (loading<sup>2</sup>) are higher than 0.5. Second, all composite reliability values and Cronbach's alpha values are

higher than 0.70, suggesting acceptable model reliability. Third, the average variance extracted (AVE) values of all constructs are higher than 0.50, indicating an adequate convergent validity and implying that our set of indicators represent the same underlying construct (Hair et al., 2013).

| First-order constructs                  | Items | Factor loading | Item loading <sup>2</sup> | Cronbach's Alpha | Composite reliability | AVE   |
|---|-------|----------------|---------------------------|------------------|-----------------------|-------|
| ABSORPTIVE CAPABILITIES<br>Acquisition* | ACAQ1 | 0.729          | 0.531                     | 0.782            | 0.850                 | 0.532 |
|   | ACAQ2 | 0.694          | 0.482                     |                  |                       |       |
|   | ACAQ3 | 0.830          | 0.689                     |                  |                       |       |
|   | ACAQ4 | 0.687          | 0.472                     |                  |                       |       |
|   | ACAQ6 | 0.698          | 0.487                     |                  |                       |       |
| Assimilation                            | ACAS1 | 0.819          | 0.671                     | 0.847            | 0.907                 | 0.766 |
|   | ACAS2 | 0.932          | 0.869                     |                  |                       |       |
|   | ACAS3 | 0.871          | 0.759                     |                  |                       |       |
| Transformation*                         | ACTR2 | 0.827          | 0.684                     | 0.874            | 0.908                 | 0.665 |
|   | ACTR3 | 0.873          | 0.762                     |                  |                       |       |
|   | ACTR4 | 0.795          | 0.632                     |                  |                       |       |
|   | ACTR5 | 0.854          | 0.729                     |                  |                       |       |
|   | ACTR6 | 0.721          | 0.520                     |                  |                       |       |
| Exploitation                            | ACEX1 | 0.791          | 0.626                     | 0.897            | 0.922                 | 0.663 |
|   | ACEX2 | 0.765          | 0.585                     |                  |                       |       |
|   | ACEX3 | 0.866          | 0.750                     |                  |                       |       |
|   | ACEX4 | 0.836          | 0.699                     |                  |                       |       |
|   | ACEX5 | 0.703          | 0.494                     |                  |                       |       |
|   | ACEX6 | 0.909          | 0.826                     |                  |                       |       |
| EXPORT PERFORMANCE                      | EP1   | 0.873          | 0.762                     | 0.927            | 0.945                 | 0.775 |
|   | EP2   | 0.889          | 0.790                     |                  |                       |       |
|   | EP3   | 0.837          | 0.701                     |                  |                       |       |
|   | EP4   | 0.915          | 0.837                     |                  |                       |       |
|   | EP5   | 0.887          | 0.787                     |                  |                       |       |

\* The variables ACAQ5 and ACTR1 corresponding to Acquisition and Transformation factor's were excluded from the measurement model due to low values. Accordingly, values lower than 0.7 generate a low correlation and threaten the reliability of the scale.

Table 1. *Measurement model*

Finally, regarding discriminant validity, this paper presents two necessary approaches: 1) the first approach suggests that the AVE should share more variance with its assigned indicators than with any other construct - Fornell-Larcker criterion (Fornell & Larcker, 1981); and 2) the second approach suggests that no item should have a higher factor load with another construct than with the one which is assign to measure. The results shown in Table 2 confirm the existence of discriminant validity in our study.

| Construct/<br>Dimension | 1.    | 2.    | 3.    | 4.    | 5. |
|-------------------------|-------|-------|-------|-------|----|
| 1. Acquisition          | 0.730 |       |       |       |    |
| 2. Assimilation         | 0.307 | 0.875 |       |       |    |
| 3. Exploitation         | 0.357 | 0.656 | 0.815 |       |    |
| 4. Export performance   | 0.390 | 0.466 | 0.584 | 0.880 |    |

|                   |       |       |       |       |       |
|-------------------|-------|-------|-------|-------|-------|
| 5. Transformation | 0.412 | 0.620 | 0.848 | 0.640 | 0.816 |
|-------------------|-------|-------|-------|-------|-------|

Table 2. *Latent constructs correlation (Fornell-Larcker Criterion)**Evaluation of structural model*

Once the measurement model is defined and validated in all its components, we will proceed and create the second order model, following previous research (e.g., Zahra & Garvis, 2000), where the latent variables of the measurement model behave as constructs' measurement variables. Specifically, Absorptive capabilities (acquisition, assimilation, transformation and exploitation) and Export performance.

In the following Tables 3 and 4, we present the results of reliability, convergent validity and discriminant validity corresponding to the second order model. All data confirm the strength of our model.

| Construct               | Cronbach's Alpha | Composite Reliability | AVE   |
|-------------------------|------------------|-----------------------|-------|
| Absorptive capabilities | 0.849            | 0.900                 | 0.694 |
| Export performance      | 1.000            | 1.000                 | 1.000 |

Table 3. *Convergence validity and reliability indexes of the second-order model*

| Construct               | Absorptive capabilities | Export performance |
|-------------------------|-------------------------|--------------------|
| Absorptive capabilities | 0.662                   |                    |
| Export performance      | 0.650                   | 0.880              |

Table 4. *Discriminant validity index of the second-order model*

Since the fundamental objective of our PLS-SEM technique is the prediction of Export Performance, the quality of our theoretical model will be determined by measuring the strength of each path ( $\beta$ ), that is the relationship between Absorptive Capability (AC) in the predictability of the endogenous construct Export Performance (EP).

Results from Table 5 indicate that firms with dynamic capabilities achieve superior export performance, thus AC, that is the acquisition, assimilation, transformation and exploitation influence significantly and positively export performance (EP), supporting H1 ( $\beta=0.479$ ;  $p<0.001$ ).

| Hypothesis   | Original Sample (O) | Sample Mean (M) | Standard Deviation (STDEV) | T Statistics ( O/STDEV ) | P values | 2.5%  | 97.5% |
|--------------|---------------------|-----------------|----------------------------|--------------------------|----------|-------|-------|
| H1. AC -> EP | 0.479               | 0.487           | 0.039                      | 12.306                   | 0.001*   | 0.413 | 0.567 |

## DISCUSSION AND CONCLUSIONS

The main goal of this study was to analyse the influence of absorptive capabilities on export performance. The central context of this research is on SMEs, which constitute the vast majority of firms in Portugal, as in most world economies. Thus, we conducted an empirical research based on a sample of 247 firms, which were applied a questionnaire in order to exploit data to test hypothesis, using proceedings and statistical techniques. It is important to note that firms evaluated intangible resources, absorptive capabilities, innovation and export performance relative to their major competitors in the export market(s), so the results should be interpreted based on these two aspects.

This study demonstrated that the firms' absorptive capabilities has a positive and significant influence on their performance. The results of this study does confirm that dynamic capabilities, specifically absorptive capabilities, enable firms to achieve superior long-term performance (Teece, 2007) (H1 supported). Thus, the analysed firms are able to acquire, assimilate, transform and dynamic capabilities.

This ones can take a variety of forms and be involved in different functions, but the most important common characteristics are that they are higher level capabilities which provide opportunities for knowledge gathering and sharing, constant updating the operational processes, interaction with the environment, and decision-making evaluations (Easterby-Smith, Lyles, & Peteraf, 2009). However, the existence of common features does imply that any particular dynamic capability is exactly alike across firms, rather they could be developed from different starting points and take unique paths (Eisenhardt & Martin, 2000).

Theoretically, this study contributes to the literature of absorptive capabilities that leverage firm performance (e.g., Cabral et al., 2015; Damanpour et al., 1989). We also highlight the contribution of this study to the theory of strategic management. It is known that strategy includes deliberate and emergent initiatives adopted by management, comprising resource and capabilities used to improve business performance (Nag, Hambrick & Chen, 2007). In order to remain competitive, firms must assess which strategic determinants give them an advantage over their competitors. The findings are a contribution to clarify the influence of intangible resources and absorptive capabilities in small firms export performance.

Additionally, our findings provide guidance to business practitioners, since they indicate that absorptive capabilities are predictors of export performance. Firms are a bundle of resources and capabilities (Peteraf, 1993), it is essential to understand and identify which resources are relevant to gain competitive advantage and superior performance. Business owners must be able to systematically analyse the changes that arise in their target market(s) and to incorporate this

knowledge into their processes, to identify the present and future needs and market trends, anticipate changes in demand and seek new business opportunities.

By building on the literature of strategic management, this study aims to support the strategic development of business management policies designed to increase firms' performance in foreign markets and add value to the current context of change.

The fact that the research does not consider the effect of control variables such as age, location and target market of the respondents can be seen as a limitation. Also, the fact that the sampling is non probabilistic and convenience is a limitation. Therefore we advise prudence in the generalization of results.

Further studies with a longitudinal perspective would be of added value to investigate why these differences persist. In other words, to find how and why some small exporters become highly successful while others, in the same industry, struggle to raise their export strengths.

### ABSTRACT

**Purpose:** This study is focusing on the applicability of an excellence model suitable to an SME and the elements that should characterize such a model. **Methodology:** A survey on literature was conducted to point out the characteristics that different excellence models have and point out the ones that are more suitable to an SME. The description of the S-P model, a quality excellence model suitable for an SME, was presented and used having enriched its variables with the advanced technology variable, making it even more adaptable to the special characteristics of an SME. **Findings:** The conclusions derived refer to the development of a revised version of the S-P model where advanced technology as an additional variable would improve the SME's competitiveness and its Quality Excellence.

*Keywords: Total Quality Management (TQM), Small Medium Size Enterprises (SME), Quality Model, Quality Elements, Technology, ISO Certification,*

### INTRODUCTION

It is accepted that the principles and the quality elements that characterize the total quality management (TQM) are mostly applied to large organizations that are using models as the EFQM Excellence Model, the Baldrige National Quality Award (MBNQA), the Deming Prize and other National Quality Awards.

For SMEs, the close relationship, and the excessive involvement that top management has on the day-to-day operations had as a result the relaxed adoption process of the quality elements. This process is supported and from their preference to flexibility and not formality that is mostly required from all the quality models including and the ISO Model (Quality Certification Standards) (Pinho, 2008).

The aim of this paper is to identify a model that can fit to an SME's characteristics and its objectives are to identify the areas that the model will improve the SME's quality level and offering innovative products and services that will make them even more competitive.

More than forty international business excellence awards and fifty quality awards exist, just in America are using some common criteria and measurements (Sampaio et.al, 2012). Though the question arises if those criteria fit and are applicable to SMEs? Competition that SMEs face during the latest years and

their need to maintain the role of subcontractors to large companies makes them have no option than to incorporate quality in their operations and their strategic plans. Thus, there is a need for them to develop a model that will incorporate assumptions suitable to the context of SMEs. A model that will be capable of supporting the internal and the external characteristics of SMEs. The internal ones that their role is to improve the SMEs processes that would result in an increase in their market value and the external ones that will bring an improvement in customers' satisfaction. This study is also considered as being one of the few studies that have tried to examine the role of a quality model to an SME as a mean of improving its quality level and its productivity.

## **THEORETICAL BACKGROUND**

A quality model's objective is to establish the criteria based on which the performance of an organization would reach the excellence level. A quality model's standards need to be strictly followed by companies, though the competition they face and the growth they search requires from them to be flexible and differentiated in their decisions and in their actions (Sampaio, et.al., 2012). The role of an award model is to assess and improve a company's operations. This would introduce and improve the methods and the techniques that will contribute in achieving their quality strategy and their continues improvement objective (Sampaio et al., 2012). A quality model is not just a tool that will help the company to solve its daily problems but instead it could develop and support more its infrastructure in order to achieve continues improvement that will support further the company's competitive advantage.

From the comparative analysis conducted by Sampaio et.al., (2012) among all different quality models used, it became clear that a single World Quality Award is needed considering that all models are using the same or similar set of values, principles and criteria.

The distinction of hard and soft elements participating in a quality model is supported from mostly all the quality models presented in literature (Choi et al., 2009). The reason for that is the inability of all the rules, the procedures and the manuals implemented and used, using only the hard elements of a quality model, to prevent humans to behave the way they consider as being the most appropriate. Also, in a continuously changing environment, the way humans respond to changes is not always easy and definitely not predictable. The key to cope with these issues is the organizational culture (Soft element) and the appraisal methods established in the organization. The need to find a way to affect and support the human behavior not by imposing rules and procedures but to improve the company's organizational quality culture is the answer (Wilson, 2015).

Quality Culture is defined from a set of assumptions a group of humans have established in an organization in order to perceive, think and feel in a reliable and correct way. But to change that culture

in a company, you need to change the assumptions that are related to the human perceptions, thoughts, feelings and behavior that constitute the soft quality elements (Wilson, 2015).

A model that incorporates the soft and the hard elements is a Quality Maturity Model (QMM) (Wilson, 2015). As a model, it tries to incorporate a roadmap that will show the way a company should follow in order to establish its quality culture. Is a framework that will guide all processes in accordance of their importance accompanied from an assessment tool that will easily assess all the inputs and outputs or any combination of them. It also introduces the quality culture elements incorporated to the company's environment, including the use of a common language and a common vision with the whole community. The use of such a model (Business excellence model) will introduce to a company the best practices and tools, supporting the development of its quality plan and a strategy. The achievement of the company's goals would also be supported from the practices and tools implementation and from imposing self-assessment and continues improvement processes to its operations (Wilson, 2015).

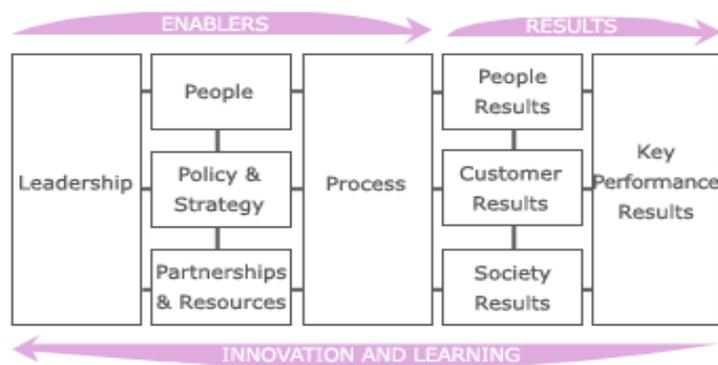

Figure 1: The EFQM Model (2010)

The EFQM Excellence model established in Europe in 1988 is using as criteria the enablers and the results defined. The Leadership, the strategy, the people, the partnerships, the resources, the people, the products and the services play the role of the enablers and the customers, the society and the people will characterize the results.

The EFQM model (**Σφάλμα! Το αρχείο προέλευσης της αναφοράς δεν βρέθηκε.**) as a diagnostic tool can be used in identifying learning and improving opportunities for a company. The criteria used in the model are the leadership, the people, the strategy, the partnerships and its resources, the processes, the products and services representing "the enablers" followed by the people results, the customer results, the society results and the key results supporting "the results". The model's implementation process should be particularly designed for an organization that has already decided on its needs and benefits expected. Of course, it is important that the model should also take the necessary time in order to assess the company's performance and growth.

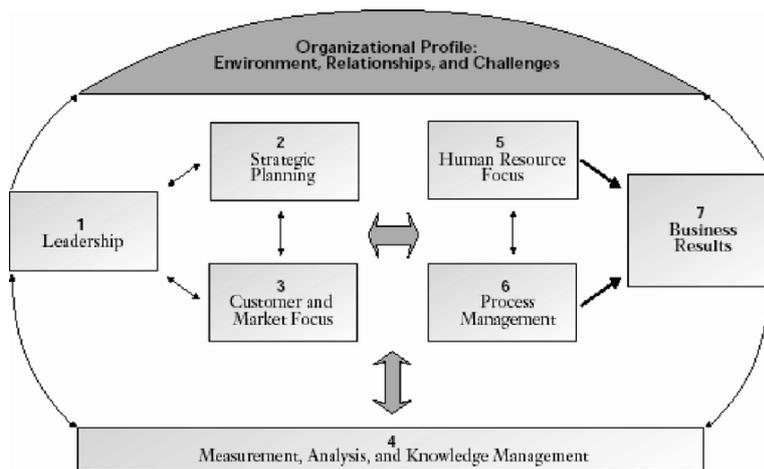

Figure 2: The MBNQA Model (2010)

Another model developed is the Malcolm Baldrige National Award (MBNQA). Its purpose is to encourage quality awareness and identify the quality characteristics that can lead a company to excellence. The models context has seven categories, as these are presented in Σφάλμα! Το αρχείο προέλευσης της αναφοράς δεν βρέθηκε., that give strategic directions to management. Those categories are the following: leadership, strategic planning, customer focus, measurement, analysis and knowledge management, workforce focus, process management and results (Sampaio, et.al., 2012). Those categories are the ones that will provide the needed strategic directions a company needs in achieving excellence. Those directions will contribute to the development of the criteria used in measuring and valuing the operational and financial self-assessment activities. The self-assessment activities will become the mean for establishing a quality management system. The role of the model is to understand and improve the quality elements implemented and to continuously improve them in case there is a need to do so. (Sampaio, et.al., 2012)

The Deming Prize is an award that is awarded to companies that have successfully implemented the TQM elements. There is no model supporting this prize but instead there are ten themes, equally weighted, that a company should be evaluated upon as these are shown in Figure 20 .

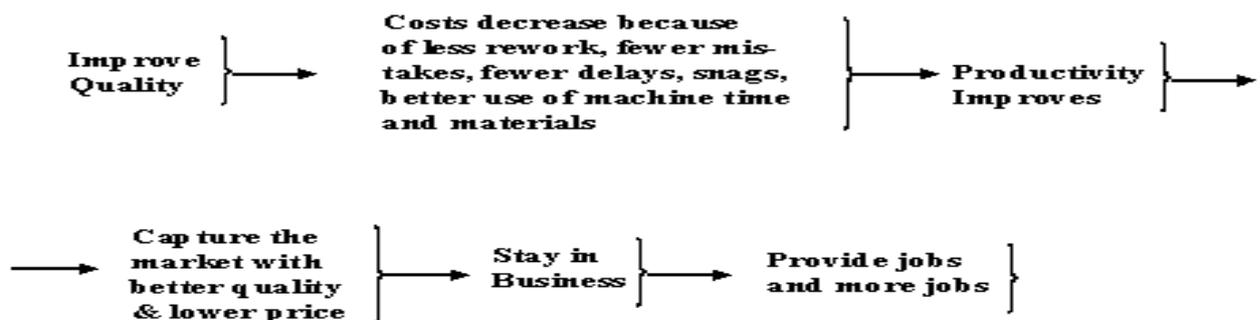

Figure 20: Deming Prize (Wayhan, et.al., 2010)

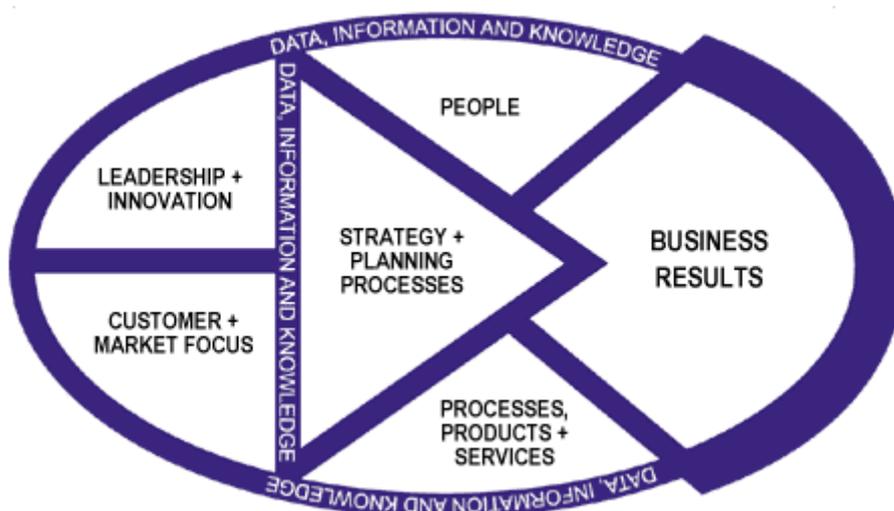

All the above quality award models were mostly applied to large organizations and they were developed according to that context (R.Schumacker, 2001) The need to adjust those models to the characteristics and the needs of an SME is presented from a number of authors (Lewis, et al.,2007; Fening, et al., 2012).

The SMEs are characterized from their informal, flatter and centralized structure. A number of empirical studies (Regan, 2000; Williams et al., 2006) have examined the adaptation and use of flexible systems for SMEs. Flexibility refers to the ability of a company to route, schedule, dispatch, match and sequence its operations. For the moment a quality model is developed for an SME, the techniques and the criteria used to measure and evaluate quality, could be the same? Is the use of a model designed to be applied in large companies would have as a result the consumption of a large number of “scarce” for an SME resources? The above questions reveal the need for the development of a quality model suitable for the needs of an SME that will manage to implement adequately and sufficiently the principles and the standards of quality and TQM in particular (Sainis et al., 2019).

## CHARACTERIZING A QUALITY MODEL, SUITABLE FOR AN SME

The flexibility and adaptability of SMEs to environmental and market changes is what creates doubts regarding the development of a model that will try to link the strategic statements of an SME to its operations that are characterized by continuous improvement activities.

An adapted EFQM model suitable for being applied to SMEs is supported from the Business Excellence Framework (BEF) shown in Figure 21 (Hafeez, et.al., 2006).

**Figure 21: Business Excellence Framework**

The starting point for TQM implementation is to set the quality processes through which the implementation of a quality assurance model (i.e. ISO 9001:2005) will be established. Though the establishment of those processes to an SME are more temporal and less clear than they are in large

organizations. Also, the ability to implement those processes could reduce the ability of SMEs to respond on time to different market or environmental changes. Though it is easier and faster for them to develop a team that will develop the SMEs process structure due to their informal and cross functional working style they usually establish (Sainis et al., 2016b).

In all the excellence models the human factor is considered as a homogeneous and numerous unit; though for SMEs there is a traditional loyalty between customers and employees created from their direct contact. So, the customer's voice is already included into an SME's operations without any additional procedures adopted that would utilize more resources and make the firms operations more bureaucratic.

The SME's environment is characterized from a limited number of resources and for implementing a quality model they need an adequate diversity of resources that are, most of the time, not available by SMEs. Though the ability of SMEs to take fast decisions may reduce the time needed for implementing a quality system (TQM) in their operations. To that, leadership commitment and the vision for accomplishing the TQM standards will positively affect the quality implementation to an SME. In addition, the experience and the knowledge of the leaders and their available time to cope with all the revealed operational, financial and structural issues, would determine the level of significance in the implementation of a quality model to an SME.

As McAdam, (2000) concluded, the strategic goals, the people involvement, the processes and the measures were the most important elements that should be included in a quality model that was going to be implemented to an SME. In particular the (a) the business goals should be strategically connected to the TQM elements, (b) the customers satisfaction and participation should have a primary role in the model, (c) the employees should participate and be familiar with all the levels and the elements of the model, (d) the purpose of the model should be understood from the management and be committed to it and finally (e) the units of measuring the level and the importance of the processes implemented should be clearly defined and understood.

For the development of a quality strategy, suitable for an SME, new methods were developed such as the balance score card and the process dashboards, which were both related to the newly developed six sigma model ((Prajogo and Brown, 2006; Sainis *et al.*, 2016). When developing their quality strategy and quality plan, SMEs could benefit from a step by step management approach. This would assist an SME to form a basic management system with aggregate flexibility and agility, which could easily be controlled and maintained, irrespective of the resources availability (Azizan, 2007; Sinha et al., 2016).

The Princer's model shown in Figure 22, developed from an unknown source attempts to relate quality with the impact it has on enlarging a company's market share and achieving possible cost reductions. That is a main objective for an SME that enters into a new market (Saunders and Preston, 2006).

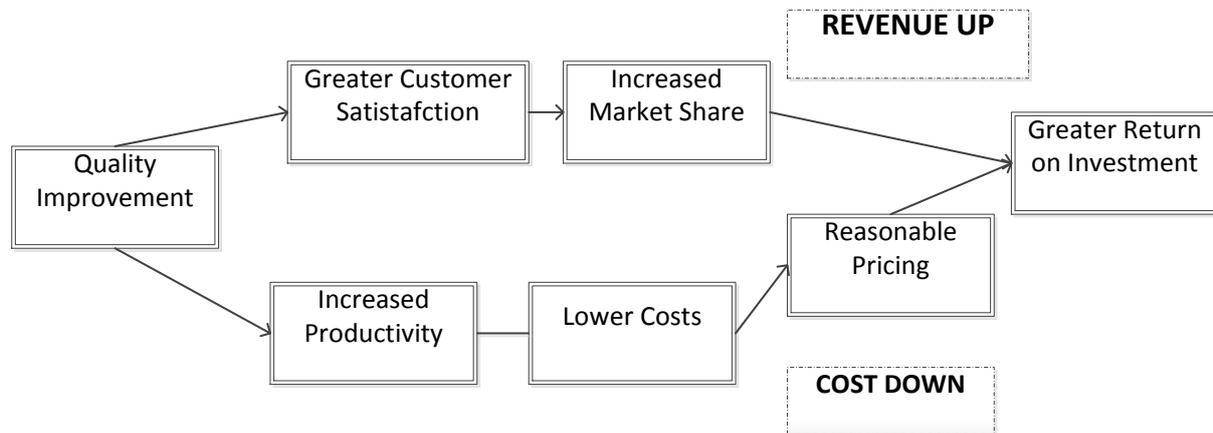

Figure 22: Princer Model

Pincer model was followed by the S-P model developed by Saunders and Preston (2006) that constitutes an elaboration of what Deming used as his main argument that is referring to the use of statistical tools as being the main source that will bring quality to a company.

The authors pointed out that a series of models have been developed capable of examining the level of TQM implementation; but all were *descriptive*, meaning that they did not prove the existence of any logical relationship between each different component used in the models. Such models were the Joiner's model (the triangle-1995) and the Juran's model (the trilogy-1989).

More descriptive TQM models, with closely related criteria were introduced to the market, like the ones presented by Lewis (2007), Dale (1994) and Holmegaad (1990) which were even more standardized, and constituted the basis for the national quality awards, like the Malcolm Baldrige National Quality Award (MBNQA), the Australian Quality Award (AQA) and the European Quality Award (EQA). These models were criticized from a number of researchers who recognized that for SMEs in particular there is no need for the development of a model that sets and examines a list of TQM characteristics, but for *a model that supports a logical chain of arguments* related to the TQM characteristics (Garvin, 2000; Saunders and Preston, 2006). This logical chain of arguments should give the opportunity to researchers to develop a model that will be suitable for SMEs, given their deficiencies they are characterizing from. Research has revealed that the deficiencies and limitations that characterize an SME is what makes the implementation of TQM being so difficult.

As a general conclusion regarding the limitations that SMEs have in implementing TQM is in the scarcity of their resources. In particular and from the literature survey conducted by (Majumdar & Manohar, 2016) it was revealed that a series of barriers prevent the full implementation of TQM to SMEs as these are presented in **Σφάλμα! Το αρχείο προέλευσης της αναφοράς δεν βρέθηκε..**

The financial and resource constraints that include the human power, the skills, the time and the technical and managerial expertise are the first and more important barriers. But except from the scare

resources the lack of management's commitment and the appropriate framework that supports the TQM the following barriers could cause the limited implementation of TQM to SMEs.

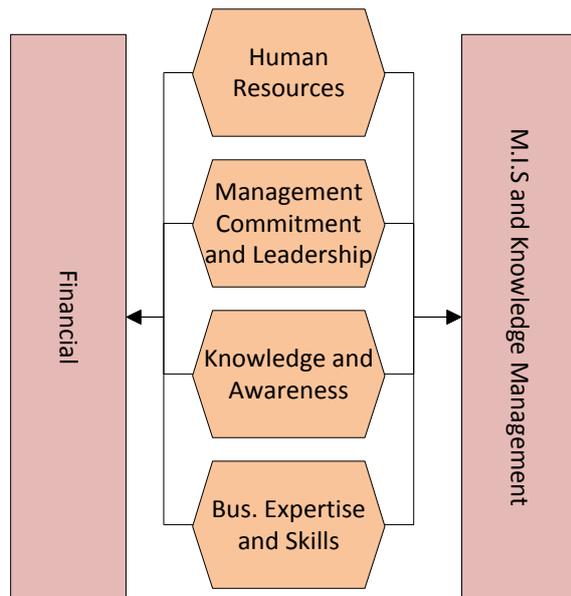

Figure 6: Generally Accepted Constraints in implementing TQM to SMEs (Majumdar & Manohar, 2016)

Barriers like the inadequate management leadership, the weak employee's culture, the low quality in personnel and technical and process management, the company's infrastructure and the informal internal communication could increase the difficulty of implementing TQM to SMEs.

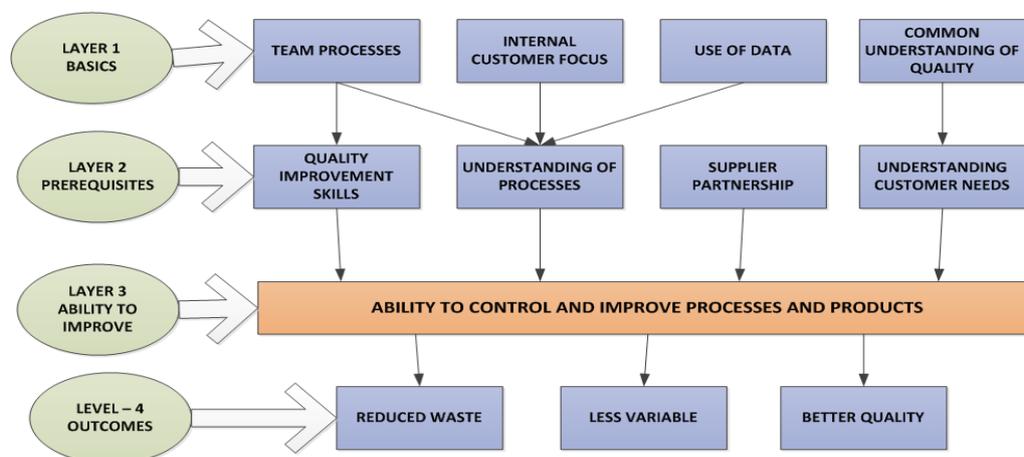

In identifying the set of problems that SMEs face in the implementation of TQM another attempt was presented in the survey conducted by Vasilevska and Rivza (2018). In this survey the first and most important factor that caused problems in the QMS implementation was the cost of developing and implementing it and the training of the needed personnel. The next importance factor was the cost of certification followed by the long time it takes to implement a QMS. Another factor was the training of the managers and process (production) staff on the quality standards followed by the cost of maintaining the QMS and as last factor was the people's low motivation. Other constraints that caused a decrease in the SMEs competitiveness were the technological obsolescence, the not so clear knowledge of the market, the unorganized operations, the unorganized supply of resources, the limited or no credit supply, the lack of facilities, and the inefficient market channels (Swamy and Nanjundeswaraswamy, 2017).

The model developed by Saunders and Preston, (2006) is the one that emphasized more the logical chain of arguments and stated that the studies conducted till then did not take into consideration the external economic factors, but instead took into account only the company's overall performance through the sole examination of the company's sales turnover or its return on investment. The model they developed would then be applied to the companies already in their journey towards total quality,

and specifically, to those with a quality assurance certificate that wished to measure the extent to which TQM practices were implemented in their environment and in their operations.

That model could also be applicable in different industries, different cultures and in different economic environments. The S-P model, as it was named, and its variables were considered the best indicators of the degree of TQM implementation in an SME ever used. The model's reliability and validity guarantee the quality of the results derived from its use (Saunders and Preston, 2006).

The model is using a set of components that shows the activities and the attributes of a company that has successfully implemented TQM. All these components are directly connected or connected through the formation of logical sequences. *The components used are classified into four groups* (Figure 23). The first group, consists of the basic characteristics of TQM that are also shown in Joiner's triangle; the second group, consists of the results derived from the use of TQM's basic characteristics the objective of which is to reinforce improvement. The third group, consists of the control procedures that are focused on the improvement of processes, products and services; and the fourth one offers the outcome which is also related to company's ability to further improve. The last group incorporates what Pincer included in his model regarding the reduction of its costs and the increase in its customer's satisfaction.

**Figure 23: The S-P model (Saunders and Preston, 2006)**

The model's vulnerability is its lack of a feedback loop. The authors clearly stated that the purpose of the model is not to describe the process of implementation, but instead to recognize the value that TQM adds to a company's overall value.

The S-P model is used and applied in different ways (a) in order to compare and support the selection of the quality elements and their factors related to the successful implementation of TQM, (b) compare, and support the methodology used in measuring the implementation level of TQM in an SME.

Both the external and the internal environments that surround the model elements may influence their relationship and the way they will behave and function.

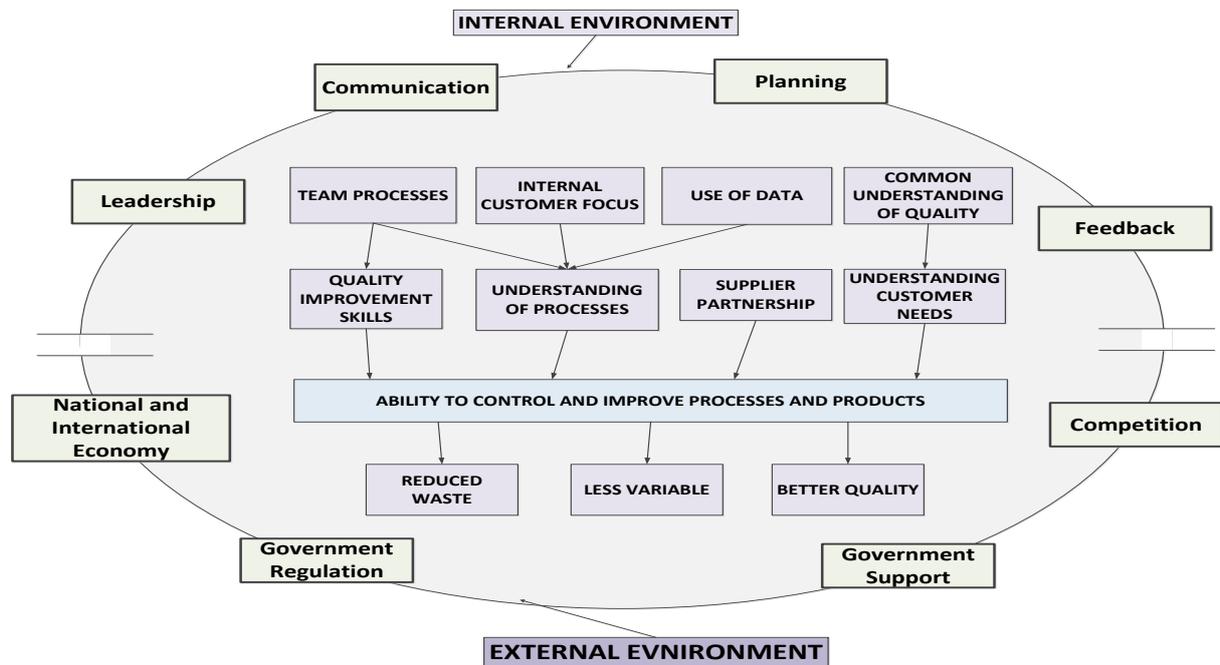

Figure 24: The S-P model and the Environment (Saunders and Preston, 2006)

Strategic and operational planning that will combine and coordinate each individual components in the model, is also needed. This will further support the links, as these are shown in figure 8, in the model and make it function efficiently producing the expected TQM benefits.

Additionally, the external environment will also contribute to an SME's ability and desire to continue with the implementation of TQM. Saunders and Preston (2006) believe that the external environment is what will influence an SME's financial and quality achievements. Specifically, the economic and competitive environment, the cultural trends and the valid government regulations that will influence the way TQM is adopted.

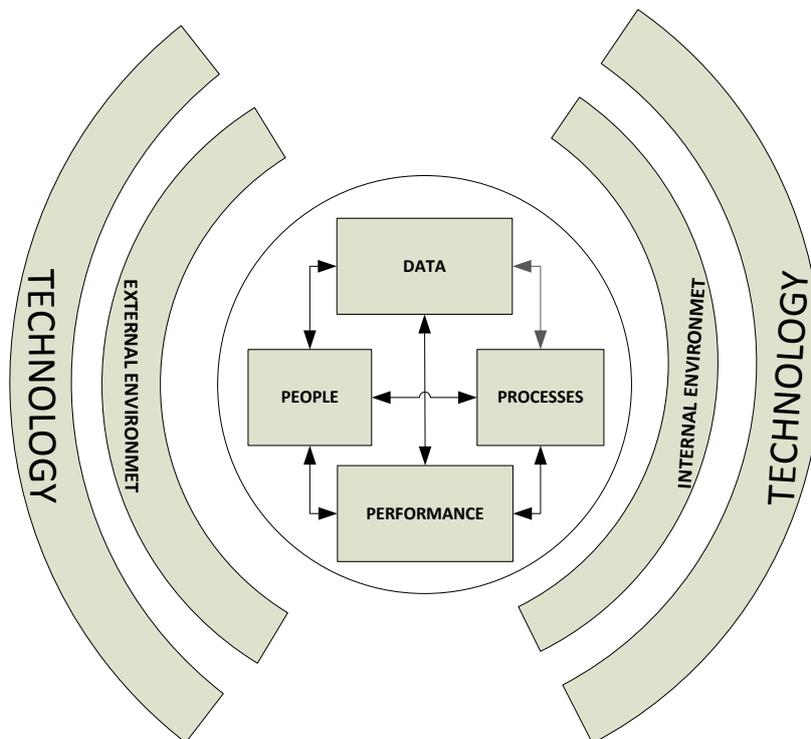

## TECHNOLOGY – THE MISSING FACTOR

Technology and TQM are complementary features and are both essential for developing a business strategy for a large organization. Technology is a factor that is missing from the S-P Model and is the one that could make the difference especially in a period where competition is becoming more global and more aggressive. Introducing advanced technological features in an SME's organizational and production framework could contribute in overcoming the limitations that conventional technologies have and are related to a further use of the economies of scale concept, reducing more the volume and the cost of producing the products or services (Swamy and Nanjundeswaraswamy, 2017).

The more advanced technologies are those that can customize the production variety, the frequent design changeovers, the rapid processing of design, the assembly, the material handling and the market

information (Subrahmanya, 1997), giving the opportunity to SMEs to apply the economies of scale reducing their cost of production in a low activity level.

Considering that SMEs are more flexible with less bureaucratic procedures, not so geographically wide spread, with limited communication channels and characterized frequently with informal processes, following an owner/manager type of leadership with less traditional limits, advanced technology can be more quickly and easily adopted by SMEs. The implementation of advanced technologies could change the company's demographic characteristics like the owner's characteristics, the expansion plans (if any) and the development of any existing or new alliances and networks developed by the company's management team (Keramati & Albadvi, 2009)

**Figure 25: The TQM for SMEs Model (Developed by the authors)**

From the analysis developed in the survey conducted by Keramati & Albadvi (2009) the positive significance is revealed between investing in technology and in IT particularly with the TQM implementation level adopted by an SME. The areas where improvements were recorded were the human resource management area, the leadership area, the planning area and the resource utilization (Figure 25).

The use of technology being supportive to TQM is what will make its implementation more applicable for an SME and will support and improve further its performance. The direct relationship that exists between the information technology and the improved strategic planning is what will support further the implementation of all those applications (Quality) that will enhance an SME's business competitiveness (Keramati & Albadvi, 2009).

## IMPLICATIONS AND CONCLUSIONS

This paper tried to investigate how the excellence models could implement quality and TQM elements to an SME by:

- Reviewing literature that is focusing on the excellence models that were applied to SMEs and
- Proposing a theoretical framework, based on the S-P excellence model suitable for implementing quality and TQM elements to an SME.

It is important to note that there are many practical implications of the results derived from this study. The implications are related to the assistance offered to practitioners, managers, and decision makers to improve further their company's productivity and its competitiveness through implementing TQM practices. Accepting that TQM is a management philosophy, a company and its management team that wants to implement that philosophy in order to change its entrepreneurial culture it should also accept the risk related to all the available opportunities they will face. This will lead them to the transformation of their organization toward new levels of excellent horizons.

The role of technology (advanced) as part of the TQM elements will facilitate and improve the HR management and leadership of an SME that would lead to an improvement of its strategic plan and resource allocation that will further increase the SME's performance indicators.

## TALENT MANAGEMENT AND RESPONSIBLE LEADERSHIP IN LUXEMBOURG

Schinzel, Ursula

Unicaf University, Nicosia, Cyprus

### ABSTRACT

The objective of this research is to study the link between talent management and responsible leadership in Luxembourg. For the purpose of this, the method used was first a review of the extant literature and second a qualitative study, where 14 semi-structured interviews were conducted mainly in summer/autumn 2018 with the objective to confirm the findings from the literature. Respondents were mainly asked what responsible leadership is for them, and what talent management, what the link is between the two, and what the cultural peculiarities following Geert Hofstede (2010) are in Luxembourg. Parts from the interviews are reprinted. A discussion and implications about both talent management and responsible leadership follows, comprehending needs for change and innovation, with the Luxembourgish language as identifier. Conclusion, limitations of this study, ideas for further research and references follow.

*Keywords: Talent management, Responsible leadership, Luxembourg*

### INTRODUCTION

This study is the combination of research about responsible leadership and talent management in Luxembourg. The aim of the present study is to determine the specificities in responsible leadership and talent management in Luxembourg. This is a mix of literature review and qualitative study, where 14 semi-structured interviews were conducted mainly in summer/autumn 2018 to confirm the findings from the literature. The research questions are: A) What is your company doing in the field of 'responsible leadership' and 'talent management' in Luxembourg? B) What do you do to find the talent you are looking for? C) Once found, what do you do to keep the people? D) Please give some examples!

14 semi-structured interviews were performed in summer/autumn 2018. Convenience sampling was used. With the current research the author contributes to the existing knowledge by developing the theory of talent management. The author combines three existing theories, namely on culture (Hofstede, Hofstede and Minkov 2010), on responsible leadership (Maccoby, 2011) and on talent management (Lewis and Heckmann, 2006). Luxembourg is chosen because it provides the author with

a steady cultural environment where other sub-cultures might vary in their behaviour (France, Germany, Belgium, Portugal, Italy, Spain...). This research is significant and strongly needed as a reinforcement of research on talent management and responsible leadership theories.

After this introduction, the paper will describe Luxembourg's linguistic and cultural peculiarities. The second paragraph is a brief literature review on responsible leadership, and the third paragraph is on talent management, where the author offers a proposition. Paragraph 4 will describe the applied method: review of the extant literature and 14 semi-structured interviews in summer/autumn 2018. Paragraph 6 will present the results from respondents, reprinting parts of the interviews. Paragraph 7 contains the conclusions, discussion, and implication, as well as research limitations and further research opportunities. References and Appendix will conclude this paper.

## LUXEMBOURG

Luxembourg is a parliamentary democracy and a constitutional monarchy, and is the only remaining Grand Duchy in the world. Per statec (2019), on 1st of January 2019, Luxembourg's total population was 613,900 of which 322,400 (52.5%) were Luxembourgers and 291,500 (47.5%) were foreigners (statec, 2019); out of them 95,500 Portuguese, 46,900 French, 22,500 Italians, 20,000 Belgians, 13,000 Germans, 48,200 other EU countries, 45,400 other countries of the world (see <https://statistiques.public.lu/en/>). Domestic employment was 448,900 with 197,000 cross-borderers come to Luxembourg every day for work: 98,200 from France, 46,700 from Belgium, and 47,200 from Germany. Unemployment rate was 5.5% in 2019 and 2.4% in 2000.

With a total size of 2,586 km<sup>2</sup>, Luxembourg is one of the smallest countries in Europe: 82 km long and 57 km wide. It has 148 km of borders with Belgium, 138 km with Germany, and 73 km with France (The World Factbook, n.d.).

Luxembourg's motto is: 'Mir wëlle bleiwe, wat mir sinn' ['We want to remain what we are'].

Luxembourg has three official administrative languages: Luxembourgish, French, German (statec, 2018, Luxembourgish (Lëtzebuergesch) being the national language. The language situation being anchored deeply in the country's history (Schinzel, 2013) in the middle of Europe and between France, Germany and Belgium, the public education system is tri-lingual. In Kindergarten the language of instruction is Luxembourgish, in primary school it is replaced by German as language of instruction and in secondary school by French (Kraemer, 1995; Schinzel, 2014a; 2014b; Weber and Horner, 2008). Citizenship is only awarded to people who speak Lëtzebuergesch (Spizzo, 1995).

## RESPONSIBLE LEADERSHIP

“In times of great cultural change, such as the present, people need leaders to take them to a positive future” (Maccoby, 2007, p. 1). And: “There is only one irrefutable definition of a leader, and that is someone people follow”. Three questions arise from this definition: Why do people follow somebody?, and: How do people follow? Who are the leaders we need? Maccoby (2007) states, there are three types of leaders: the strategic leader, the operational leader and the network/bridge-building leader. However they all need to understand that not everybody is like them, on the contrary, that the key to success is understanding the diversity of people. Understanding people, and combing head and heart are central to Maccoby’s idea of responsible leadership (p. 14 15), as well as education, especially education of our children (p. 154). The importance of education is expressed in his introducing sentence: “Our prosperity and well-being depend on our ability to learn” (p. 133), and the question is asked: what can schools do? (p. 135). Some educational mottos are: “Work hard, be nice.”, “Team always beats individual”, “Never give up”, “I believe that success comes from doing the best I can do, not from winning” (p. 137). He describes the principles of the KIPP (Knowledge is Power Program): first: talented leadership, second: more time for sports, games, music, dancing, literature, third: quality of instruction, and fourth: shared values.

Emotional Intelligence is integral part of the ability to understand people: to understand what motivates them and how they think (p. 178).

2500 years ago Lao Tzu wrote about the ideal leader: The ideal leader is the one who helps people so that finally they don’t need him any longer. Then comes the leader people love and admire, then the leader they fear, then the leader who pushes people around. People will not trust a leader who does not trust them. The best leaders say little, and people say: we did it ourselves (p. 176).

Following Szekely and Knirsch (2005, pp. 628, 629) responsible leaders build sustainable relationships with all of their stakeholders, with the aim to achieve shared objectives. “Sustainability is about building a society in which a proper balance is created between economic, social and ecological aims”. This comprises the different leadership streams: authentic, ethical, servant and transformational.

Voegtlin, Patzer and Scherer (2012, p. 6) state: “Leaders (and followers alike) are increasingly confronted with heterogeneous cultural contexts, devoid of shared moral orientations or legal frameworks. As moral or ethical conflicts arise in the process of economic activities, business leaders are left without any orientation in regard to morally adequate action. In this situation the idea of value maximization often becomes the sole surrogate for moral principles. This problem is aggravated by the need to transcend the traditional, internally bound focus of leadership theory.” (Maak, 2007; Maak and Pless, 2006; Pless, 2007). Edgar Schein’s corporate culture survival guide (2009) is increasingly important, as well as his book on organizational culture and leadership (2010).

## GEERT HOFSTEDÉ'S CULTURAL DIMENSIONS

The author replicated Geert Hofstede's cultural dimensions study in Luxembourg in 2011 as her doctoral thesis and compared the findings with Hofstede's estimates. Luxembourg's specific cultural environment is characterized by low Power Distance (PDI=29), high Uncertainty Avoidance (UAI=95), low Individualism = high Collectivism (IDV=34) (COL=66), medium Masculinity (MAS=54), high Long-Term Orientation (LTO=65), medium Indulgence versus Restraint (IVR=55), and low Monumentalism (MON=24).

Table 1 (Schinzel, 2017a) shows Hofstede's (2001) and Hofstede et al.'s (2010) cultural dimensions of Lux.Nat. and Lux.All., Hofstede's estimates for Luxembourg, his data for France, Germany, the UK, Belgium FR, Belgium NL, Italy, the Netherlands, China, the USA and Japan (on a scale from 1-100, 1 being the lowest and 100 the highest score), where the cultural differences become clear.

**Table 2 Cultural Comparisons (Schinzel, 2017a)**

|     | The author's Lux.Nat. | The author's Lux.All. | Hofstede's estimates on Luxbg | Hofstede's France | Hofstede's Germany | UK   | Belgium FR | Belgium NL | Italy | NL   | China | USA  | Japan |

## TALENT MANAGEMENT

There are different definitions what “talent management” is, it is difficult to come up with one single correct definition. “It is difficult to identify the precise meaning of talent management” say Lewis and Heckman (2006, p. 139). Talent management comprises first the variety of typical human resource management activities, including candidate selection, recruiting, development, training, career planning, succession planning. Second, talent management’s focus is on talent pool and the management of the progression of employees through different positions in the company. Third, talent management looks at talent in general, speaking about ‘war for talent’ and ‘highly competent performers’, the talent inherent in each person. (p. 141). Making talent management strategic is the objective of more recent authors (Kaufman, 2012; Chanda et al., 2007) and/or making it global (Minbaeva and Collings, 2013). There being 4 categories of employees, following their difficulty to be replaced and their value added: 1) Difficult to replace, high value added; 2) difficult to replace, low value added; 3) easy to replace, low value added; 4) easy to replace, high value added.

Social media, computer technology, cloud computing and globalisation (Guo, Rammal and Dowling, 2016) imply a different approach to strategic talent management (Oracle, n.d.). This is in line with Vrontis et al (2018) research on the impact of innovation and change on employee’s performance, claiming the need for change and innovation as determinants for success in organisations. Nearly 10 years earlier, Malaeb and Chanaron (2010, p. 1) say that “Talent is the only differentiator for company’s success in a global, complex, extremely competitive and dynamic environment”. Ambrosius (2016, p. 53) asserts that ‘employee turnover is one of the biggest challenges for multinational corporations’. Low and Ang (2012, p. 108) include Confucian Leadership in leadership research and talent management, claiming that “talent or human capital is the primary driver of any successful company, where the company provides for stable employment, security, fair pay and safety, and diversity, equal opportunity and the prevention of sexual harassment. Confucius said about talent: “Some seedlings spring up but never blossom, others blossom but never bear fruit” (p. 108). Church and Conger (2018) maintain that the real challenge for talent is not becoming a high potential, but staying one. This requests continuous learning during the entire career, including

continuous feedback. Charan (2017) proposes a self-test for high-potential leaders, and focuses on your general mind-set, stating: "The central premise of a talent-driven company is that talent drives strategy, as opposed to strategy being dictated to talent. The wrong talent inevitably produces the wrong strategy and fails to deliver" (Charan, Barton and Carey, 2018). Achieving your full potential is key, to get everyone to improve until their full potential., and this with regular business reviews, trainings, and outlooks for the next 2-3 years, checking if new technologies have come up and new knowledges are needed to confront them (p. 156, 157). "The best way to inform yourself about another person is through close observation" (Conaty and Charan, 2010), and: "Talent mastery requires the same rigor and consistency to build your skills – in this case, identifying, developing, and retaining the talent you need for a competitive edge. It requires dedicated processes and resources. Above all, it requires total commitment" (p. 302). Kaye and Jordan-Evans have found the solution to how to getting good people to stay: "Love 'em or lose 'em (Kay and Jordan-Evans, 2014), means: you have to love your people, otherwise you will lose them. Hoffman, Casnocha and Yeh (2014) suggest 'Building trust through honest conversations' (p. 26), and use the alumni network for network intelligence (p. 151). Reid Hoffman is cofounder and chairman of LinkedIn.

It is worth citing Hofstede himself: "... Luxembourg has a high score on uncertainty avoidance which means that as a nation they are quite reluctant to test unknown territories. Security is a key word in Luxembourg: there is not one activity which is not dependent on some sort of security control from authorities; from banker's money to safety exits in a restaurant. It makes life in Luxembourg very safe, but some would argue a bit boring. New ideas, new methods, new management techniques must first be proven to work in other countries in order to be accepted in Luxembourg. Historically more "farmers" than "traders", the inhabitants kept that good old "common sense" made of cautiousness which has proven to be profitable for a country who managed not to be at war since the Napoleonic time! (<http://geert-hofstede.com/luxemburg.html>).

The following proposition is offered: Luxembourg's responsible talent management will depend on its linguistic and cultural particularities.

6. Innovation and change (Vrontis et al., 2018)

## METHODOLOGY

For the purpose of this research, the current literature was reviewed for interviews in the field of responsible leadership and talent management. This means using secondary data, trusting what other people said to third people and how they wrote it down. In order to validate the findings from this secondary data, the author collected primary data while performing 14 own interviews. Respondents were asked the following questions: A) What is your company doing in the field of 'responsible leadership' and 'talent management' in Luxembourg? B) What do you do to find the talent you are looking for? C) Once found, what do you do to keep the people? D) Please give some examples! For confidentiality reasons, interviews were not recorded or filmed. In-depth notes were taken during the interviews. After the interviews, the respondents were presented with a summary of the interview and asked for their consent. Interviews were in Luxembourgish, French, German, Italian or Spanish and translated into English.

## RESULTS FROM THE INTERVIEWS

The results are shown in this paragraph. Table 2 summarizes the respondents' demographics.

**Table 4 Respondents' demographics (N=40)**

| Respondents' profile | Classification | Number of respondents |
|----------------------|----------------|-----------------------|
| Gender               | Male           | 7                     |
|                      | Female         | 7                     |
|                      | Total          | 14                    |

| Total           |  | 14 |

In total, the 14 respondents come from 5 different countries: Luxembourg, France, Germany, Italy, Belgium and speak 6 different languages, two holding double nationality: German + Luxembourgish. Native languages are: Luxembourgish (6), German (3), French (3), Italian (2). 1 respondent speaks six languages, 4 speak 5 languages, 5 speak 4 languages, 3 speak 3 languages, 2 speak 2 languages.

Research results are best shown through the citations from the 2018 study. Therefore the responses from the different respondents are reprinted hereafter.

HR manager at a state institution: "Talent search and Talent management, Talent-keeping at my company goes over Motivation and Work Climate. We are a public institution. We cannot just give some more money / a higher salary to attract / to keep people.

It all happens with Motivation and Work Climate: we have an excellent work climate. We undertake activities together. We undertake activities outside work together, like Sports Pour Tous: lunch: Midi-Gym together: Tuesdays and Thursdays in Badanstalt, or also we came to Limpertsberg, but now that the Badanstalt is re-opened, we prefer to go to Badanstalt, it is just across the street from our office. Sports pour tous ist heilig, c'est sacré, it is sacred."

Employee at a Research Institution: "We urgently need new talents. Luxembourg does not have enough right talents. There are many people, but they do not fit the job openings. There are a lot of open job positions, because the people with the right talents do not come to Luxembourg for work. But what to do to attract them? We perform a lot of questionnaires, researches, but still, we do not know exactly what people motivates not to come. It seems to be more attractive to work in a big city like Paris, culturally."

Another employee at another Research Institution: "It is difficult to recruit talent for Luxembourg. The only way to attract people to coming to work in Luxembourg is money. Still, it is not always the only motivator. What we lack in Luxembourg are other motivators, attractive reasons for people to come, like for example we lack a university of worldwide renown, or famous research centres. Besides

money, there is nothing interesting in Luxembourg that would attract talent. In plus, the bad weather. In addition, Luxembourgers are very slow. They are so much into their procedures, you would like to shake them to wake them up to get things done faster. They stick so much to their old habits, it is impossible to make them change or make them move. Everything takes too much time here, procedures are followed by the letter; they are long lasting, and discourage new entrants. We attended a conference yesterday in Amsterdam for the first time to represent Luxembourg. The representatives from the other countries told us, that it is high time that Luxembourg participates as well."

The director of an industry: "The first priority at long-term is the capacity to develop and attract the necessary talents, the qualified profiles in all sectors of the economy. Or these necessary talents have to innovate or they will envision serious regulatory constraints. The government needs to provide access to resources to ensure more innovation."

"Of course Luxembourgers prefer to hire Luxembourgers, this is because of the language. People all over the world prefer to reduce their efforts, therefore they prefer to speak their mother tongue. This is valid for the French working in Luxembourg who prefer to hire French speakers, and/or Germans hiring German speakers. The language is the identifier."

A headhunter said: "When looking, for example, for an accountant in another country than Luxembourg, you are looking for somebody with the technical skills of an accountant. The right person for the job. When looking in Luxembourg for an accountant, you add the language skills to the technical skills. This is where it gets tricky. Because technically fit accountants speaking Luxembourgish, French, English, German and and and, are rare. Often they have the technical skills, but don't speak all of the languages. Or they speak all of the languages but don't have the technical skills. The few 'cherries on the cake' are known all over the place (Luxembourg), and are highly paid, to make them stay in their position. Therefore, it is quasi impossible to make such a highly paid, technically fit accountant who speaks L, F, E, G move to another company. Money being one of the motivators, but not the only motivator, is not always the best argument for a job change."

"We have to clarify what we are looking at. In Luxembourg, Luxembourg Nationals are a minority, those who are Luxembourgers by birth representing less than 30% of the population. Adding 189.000 cross-border workers to the 71% foreigners living in Luxembourg. The real Luxembourg National has his origins in farming. Nearly all Luxembourg Nationals work for the State as civil servants. There are hardly any Luxembourg Nationals working in the private sector, where Foreigners and Cross-Borderers work. This is a dilemma, as Geert Hofstede excluded civil servants from his cultural study; here in Luxembourg, you will hardly find any Luxembourg Nationals in the private sector. What counts in Luxembourg is the social class to which you are born, not whether you are foreigner or not."

"I know somebody who is a true Luxembourger, who is a manager. He has a company. He says that he has done his business for 30 years now and that he does his business the way he does and he will continue this way and he will not change. The young people he hires all leave, because they want change, innovation. But he doesn't want to change anything or innovate. He wants to stick with his procedures and his business connections that he has since the beginning."

"Luxembourg lacks talent. There are not enough qualified people. There is no 'Knowledge Community', as the University only started 15 years ago. There is a top 1% that rules the country, inaccessible for the common citizen. Luxembourg seems to be an open society, but it is not. The language is the key issue. Either you speak it, then you are in the in-group, or you don't speak it, then you are out. The foreigners work hard, they bring the talent. In my opinion, the typical Luxembourger is dying, not only his language, but also the species."

Besides, I do not work with Luxembourgers. I am founder and manager of my own business. Not one single Luxembourger wants to work in our business, or in other businesses. It's too hard work. They all want to be employed by the State, which means earning a lot of money for little work. Most Luxembourgers study at a University, they come back with their diplomas and claim a highly paid position, instead of starting in a private business and learning from a boss, like me. They do not want to do that. We employ only French and Belgians. They work well, they are happy with the good work, to learn, to be treated well, and to contribute to a small private business.

"The real estate situation is discouraging new comers. Housing, lodging is horribly expensive in Luxembourg. Who can afford buying an apartment here? If you want to live in town, and to avoid the traffic jams, then you need to go small. Small apartment, yes, my children even agreed on sharing a single room, just to stay living in town."

"The traffic situation is chaotic! There are road works everywhere. The entire town is in road works, traffic jams are so long, you take 1 hour or 2 hours to cross town, just 1 km. This is getting on our nerves, there are too many road works all over."

"The tri-lingual public education system is a challenge for all new entrants into the country. Luxembourgish, German and then French as instruction language in this order in school is demanding for children and their parents, mathematics in Luxembourgish, German and then in French is a real challenge, if you thought mathematics on its own was a challenge, then try it in these 3 languages, and add English and/or Portuguese to it!"

One respondent put it this way: "The Cross-Borderer's biggest issue is the traffic. All day they reflect on how to get back home best, and how to come to work best the next morning. They use either the train, with its uncertainty or the bus, again with its uncertainty, or the car, with the traffic jam for 100% certain! On the way, they are on their iPhones, writing emails, writing reports, telephoning,

working, writing presentations on their iPads, or they sleep, or they do their make-up, or talk to their neighbour. From my experience, cross-border workers always arrive late in the mornings, every morning, without a word of excuse they arrive at 10 a.m., by the time they start working it is 10:30, because they are so exhausted from the traffic. In the afternoon, around 3p.m. they get nervous and want to leave before the traffic starts. Others decide to stay later to leave after the traffic. But employees with children have to leave early. They will skip lunch and work through their lunch break.”

## IMPLICATIONS

This article contributes to the discussion on talent management in the field of leadership theory. It is the combination of research about talent management and responsible leadership in Luxembourg. The method used is a mix of literature review and qualitative study, where 14 semi-structured interviews were conducted mainly in summer/autumn 2018 to confirm the findings from the literature. The Luxembourgish language is used as an identifier, guarantee of success. Despite numerous activities and incentives in Human Resource Management to attract talent to Luxembourg, many a candidate/talent hesitates if taking/staying in a job position. Typical peculiarities, such as the three-lingual education system, sticking to old traditions, avoiding change, the weather conditions and the smallness of the place prevent many a person to coming for a job, and/or to remain in a job. On the other hand, Luxembourg often is and has been forerunner in promoting peace and tolerance in the European Union and the world, in start-ups creation (Mercier, 2018), in satellite technology and many more innovative projects. The lack of talent, especially the lack of talent speaking Luxembourgish, is one of the biggest issues to be solved in the future. Luxembourgish, French and/or German language courses are inherent component of expatriates’ relocation package.

**Table 5 The link between talent management and responsible leadership**

|  |

| The link between talent management and responsible leadership  |
| <p>If you want to be a responsible leader in Luxembourg, you need to attract and keep/hold/retain - train the talent the country needs. You need to create motivators to make them come and stay, you need to install change. You need to solve the traffic issue. You need to solve the housing issue. You need to learn the languages: Luxembourgish, German, French, in plus to English and Portuguese. You need to get used to the smallness of the place, and to the weather conditions, if possible.</p> <p>- The need for new talents: We urgently need new talents. Luxembourg does not have enough right talents.</p> |

- The need for new motivators: We urgently need new motivators, attractive reasons for people to come to work to Luxembourg. Besides money, there is nothing interesting in Luxembourg that would attract talent.

- The need for change: We urgently need change. Luxembourgers are very slow. They stick so much to their old habits, it is impossible to make them change or make them move. Everything takes too much time here, procedures are followed by the letter; they are long lasting, and discourage new entrants.

The Luxembourgish language is the key issue. Either you speak it, then you are in the in-group, or you don't speak it, then you belong to the out-group.

Therefore:

The lack of talent, especially the lack of talent speaking Luxembourgish, is one of the biggest issues to be solved in the future. Luxembourgish, French and/or German language courses are inherent component of expatriates' relocation package.

Traffic:

The Cross-Borderer's – and not only - biggest issue is the traffic. ...cross-border workers always arrive late in the mornings, every morning.... They will skip lunch and work through their lunch break. At around 3p.m. in the afternoon they get nervous and want to leave before the traffic starts.

There are horrendous traffic jams, there are road works everywhere. The entire town is in traffic chaos.

Real estate / Housing:

The prizes for housing - real estate – buying and renting are very high.

The tri-lingual public education system:

Luxembourgish, then German and then French as instruction language in public school is a challenge for all: children and parents.

Climate/weather:

The weather is difficult to live. If you are not born in Luxembourg, it is difficult to stand the grey.

The smallness of the place:

Luxembourg is small in size and in people. Everybody knows everybody and everything.

After this summary of results from the interviews, the next paragraph will come up with conclusions, limitations and ideas for further research.

## CONCLUSIONS, LIMITATIONS AND FURTHER RESEARCH

The purpose of this study was to combine research about responsible leadership and talent management in Luxembourg by figuring out their specificities. The research was a mix of literature review and qualitative study, where 14 semi-structured interviews were conducted mainly in summer/autumn 2018 to confirm the findings from the literature. The research questions were: A) What is your company doing in the field of 'responsible leadership' and 'talent management' in Luxembourg? B) What do you do to find the talent you are looking for? C) Once found, what do you do to keep the people? D) Please give some examples! After the literature review and the review of local articles in the field of responsible leadership and talent management (secondary data), the author performed interviews (primary data) and reprinted parts of the interviews in the above paragraph. In conclusion, the author's proposition was confirmed: Luxembourg's responsible talent management depend on its linguistic and cultural particularities.

In conclusion, it can be said that the link between talent management and responsible leadership is the following: If you want to be a responsible leader in Luxembourg, you need to attract and keep/hold/retain - train the talent the country needs. You need to create motivators to make them come and stay, you need to install change. You need to solve the traffic issue. You need to solve the housing issue. You need to learn the languages: Luxembourgish, German, French, in plus to English and Portuguese. You need to get used to the smallness of the place, and to the weather conditions, if possible.

In the following the author would like to point out some of the peculiarities: First the Luxembourgish language: despite the multi-lingual and multi-cultural environment, the importance given to the Luxembourgish language cannot be stressed out enough. The Luxembourgish language is not only used as identifier (2013, 2014a, 2014b), but also as key success factor. Second: the Luxembourgish culture: again, despite their geographic position in the middle of Europe, squeezed between their big neighbours Germany France and Belgium, the Grand Duchy is a culture apart. During the Second World War, Germany annexed the small country, thinking it was German, but the Grand Duchy of Luxembourg is a culture apart. It is nor German, nor French, nor Belgian.

Luxembourgers with Luxembourg Nationality are characterised by Hofstede's cultural dimensions: low Power Distance Index (PDI=29), high Uncertainty Avoidance (UAI=95), low Individualism (IDV=34) - high Collectivism, medium Masculinity versus Femininity Index (MAS=54), high Long-Term Orientation (LTO=65) versus Short-Term Orientation, medium Indulgence versus Restraint Index (IVR=55), and low Monumentalism Index (MON=24), with a mix of at least three official languages: Luxembourgish, German and French.

Besides avoiding any change, and sticking to their ancient traditions, they would be forerunners in European integration and European Union formation, in innovation such as satellite technology, space mining, and start-up incubator (Mercier, 2018). However, the lack in talent, namely the lack in talent speaking the Luxembourgish language, will be in the focus to ensure a safe continuation in growth and advancement in innovation. Another peculiarity needs to be addressed: the fact that Luxembourg Nationals work mainly for the State, as Civil Servants, while foreigners usually work for the private sector. There are hardly any Luxembourgers working in the private sector. The private sector is for foreigners, both residents and cross-borderers.

Future research could look into Responsible leadership and talent management among 3 different groups: first Luxembourg nationals, second foreigners living in Luxembourg (expatriates coming from the entire world) and third cross-borderers from France, Germany and Belgium.

Research limitations are, first time limitation. This research was made with the objective of conference presentation and publication. Second personal limitation. The author being a single person cannot compete with huge groups of researches, such as the GLOBE (House et al, 2004) etc. Also, the author decided to concentrate on Geert Hofstede's research. This decision can be contested, however Hofstede was the initiator of cultural dimension research, despite later criticism of his methods.

This being a mix of literature review, secondary data and primary data from qualitative research, more sophisticated statistical methods could be used in the future with the objective to deepen the results.

Another particularity the author would like to point out is the fact, that the interviewed managers were exclusively 'responsible leaders' in their eyes. None of the interviewed leaders said: "I am an irresponsible leader' (Schinzel, 2017b).

Observation is the beginning of everything, and the author did exactly this: observe the current situation, supported by analysis of ideas on responsible leadership theory and talent management theory.

# ROBOTIC PROCESS AUTOMATION AS AN EMERGING CAREER OPPORTUNITY: AN ANALYSIS OF REQUIRED QUALIFICATIONS AND SKILLS

Schlegel, Dennis<sup>1</sup>; Kraus, Patrick<sup>2</sup>

<sup>1</sup>School of Informatics, Reutlingen University, Reutlingen, Germany

<sup>2</sup>Business School, Pforzheim University, Pforzheim, Germany

## ABSTRACT

The automation of work by means of disruptive technologies such as Artificial Intelligence (AI) and Robotic Process Automation (RPA) is currently intensely discussed in business practice and academia. Recent studies indicate that many tasks manually conducted by humans today will not in the future. In a similar vein, it is expected that new roles will emerge. The aim of this study is to analyze prospective employment opportunities in the context of RPA in order to foster our understanding of the pivotal qualifications, expertise and skills necessary to find an occupation in a completely changing world of work.

This study is based on an explorative, content analysis of 119 job advertisements related to RPA in Germany. The data was collected from major German online job platforms, qualitatively coded, and subsequently analyzed quantitatively.

The research indicates that there indeed are employment opportunities, especially in the consulting sector. The positions require different technological expertise such as specific programming languages and knowledge in statistics.

The results of this study provide guidance for organizations and individuals on reskilling requirements for future employment. As many of the positions require profound IT expertise, the generally accepted perspective that existing employees affected by automation can be retrained to work in the emerging positions has to be seen extremely critical.

This paper contributes to the body of knowledge by providing a novel perspective on the ongoing discussion of employment opportunities, and reskilling demands of the existing workforce in the context of recent technological developments and automation.

*Keywords: Robotic process automation, future of work, digital labor, qualification, skills, employment, job advertisements, Germany*

## INTRODUCTION

In their widely discussed study, Frey and Osborne (2013), indicate that almost 50 percent of total US jobs are facing the risk to get automated in the course of the following two decades. Although, the

impact of automation might be exaggerated, as indicated by Bonin *et al.* (2015), who transferred the results of Frey and Osborne (2013) to the contextual setting of Germany. They indicate that 12 percent of jobs in Germany are facing a high risk to get automated soon and see a marginal lower impact on the US labor market. Nevertheless, the results indeed show that recent technological developments will tremendously change the working world we currently know. Birchall and Giambona (2008), for instance, show how managers experience the use of information and communication technology tools and what the potential on innovation could be. Moreover, Morakanyane *et al.* (2017) indicate that especially operational processes are affected by digital transformation (see also Gimpel *et al.*, 2018) and Robotic Process Automation (RPA), as a key technology in this field, plays a major role in these developments (Osmundsen *et al.*, 2019; Deloitte, 2018; Roland Berger, 2018; Anagnoste, 2017). The automation of work with RPA, but also by means of complementing technologies such as Artificial Intelligence (AI) and Internet of the Things (IoT) is currently intensively discussed both in the academic community and the business world. At the same time, companies are investing heavily in the automation of their processes. According to Gartner (2018), estimated 680 million USD were spent on RPA software in 2018. Additionally, it can be assumed that consulting fees for the introduction of the tools and new processes substantially exceed the license fees so that the total investment in the technology is even more substantial. It is assumed that 85 percent of large organizations will use RPA by 2022 (Gartner, 2018) and the dissemination of RPA applications will continue to grow (Capgemini, 2016; Deloitte, 2018).

In the discussion of new automation technologies, both positive developments but also fears are intensively discussed (Cooper *et al.*, 2019; Madakam *et al.*, 2019; Mendling *et al.*, 2018; Moffitt *et al.*, 2018). The more negative voices emphasize negative employment effects, and focus on the idea that robots replace humans or that robots “take over.” On the positive side, opportunities for individuals, organizations, and society as a whole are mentioned, e.g., artificial intelligence liberating humans from tedious and meaningless administrative tasks. One of the uncontroversial points in the debate is certainly that today’s employees will require substantial training, and reskilling to meet the demands of new job profiles as existing jobs are vanishing. These reskilling requirements constitute a significant change and challenge in today’s business world.

While many previous studies (e.g. World Economic Forum, 2018; McKinsey Global Institute, 2017; Frey and Osborne, 2013) focus on the macro-economic level of analysis, this study focuses on the level of individual job opportunities and therefore has specific managerial implications. The study intends to underpin and illustrate the general discussion with real-life data on employment opportunities that emerge from one partial area of the latest automation trend.

The overall research objective of this study is to provide details on employment opportunities as well as specific skills and qualifications for future employment in the field of RPA. By doing so, the specific aims of the study are: First, to analyze whether new jobs are emerging from RPA (without quantifying the overall macro-economic employment effect). Second, to analyze what qualification and skills are required for the emerging job profiles. This study uses a content analytical research design to analyze job advertisements from different online job platforms.

This paper contributes to the body of knowledge by analyzing secondary empirical data providing a novel perspective on the ongoing discussion of employment opportunities, and reskilling demands of the existing workforce in the context of recent technological developments and automation.

The paper is structured as follows: In section 2, RPA is precisely discussed and defined. This is followed by a general discussion of the employment effects of automation, as well as, implications on qualification and skills. In section 3, the research methodology and design of this study is presented. Subsequently, in section 4, the results are presented. Finally, in section 5, the research results are summarized, discussed, and critically reflected against the literature.

## LITERATURE REVIEW

### *Robotic Process Automation*

The term RPA, as well as, accompanying graphical illustrations in publications by popular media and consulting firms nurture the notion that RPA involves humanoid robots or other hardware-based robotics technology. However, RPA is a software-based solution that performs tasks that have previously been conducted by humans (Willcocks *et al.*, 2015). Typically, RPA solutions are employed in processes where activities are performed across different user interfaces, and systems that are not integrated into the back-end, and thus, require manual steps. As Gartner (2018) describes, RPA tools “mimic the manual path a human worker would take to complete a task, using a combination of user interface interaction describer technologies.” Solutions can be employed both on individual desktops or operating on enterprise servers. In a similar vein, the IEEE defines RPA as “A preconfigured software instance that uses business rules and predefined activity choreography to complete the autonomous execution of a combination of processes, activities, transactions, and tasks in one or more unrelated software systems to deliver a result or service with human exception management” (IEEE, 2017). It is important to note that that automating business processes, which has been done for years and the implementation of RPA must not be understood as similar phenomena. RPA tends to be easily configured, is a software that is non-invasive, accessing systems like a human being would and is enterprise-safe, in terms of i.e. security (Lacity and Willcocks, 2016; Osmundsen *et al.*, 2019).

RPA has been classified as so-called “lightweight IT”. The term expresses the contrast to an increasing size and complexity of systems in the attempt to integrate different systems in heterogeneous landscapes (Penttinen *et al.*, 2018; Lacity and Willcocks, 2016). Provocatively, one could argue that RPA is the surrender in the battle against non-integrated system landscapes and a workaround replacing the human element in non-optimal processes instead of fixing the problem in the back-end.

Typical use cases for RPA are back offices of industries like financial services and utilities and telecommunications (Willcocks *et al.*, 2015; Gartner, 2018; Roland Berger, 2018). The reason is that the companies in these industries have many repetitive administrative processes, thus, employing RPA provides large cost saving potential. Processes which are standardized, routinized and have a high and predictable volume are considered to be most appropriate for the application of RPA (Osmundsen *et al.*, 2019), hence the identification of suitable processes is pivotal for a successful application (Leshob *et al.*, 2018). Van der Aalst *et al.* (2018) also state that the main motivation of companies employing RPA is achieving a high Return on Investment (RoI) and indeed studies indicate positive effects on economic performance indicators (Osmundsen *et al.*, 2019, Deloitte, 2018).

Besides RPA, there are more advanced forms of automation that are “cognitive,” or “intelligent” (Anagnoste, 2018; Willcocks *et al.*, 2015). A large potential might also lie in the combination of RPA with machine learning solutions to create “cognitive RPA solutions” (Reddy, 2018).

#### *Employment Effects of Automation*

Automation in general – including RPA and other forms of automation (Lacity and Willcocks, 2016) – have a large impact on jobs as work activities that humans perform are substituted by machines and algorithms. The possible negative effects associated with this development are raising public concern today and have done so in the past, e.g., in the industrial revolution of the early 19th-century when textile artisans were replaced by machines (Autor 2015). However, one has to differentiate between short- and long-term effects as in the long run new jobs might be created based on new technological possibilities (Bhattacharya, 2017, McKinsey Global Institute, 2017). As Autor (2015) points out, history shows that the unemployment rate has not increased in the long run despite automation and technological progress. However, automation does create large shifts between sectors and job profiles as shown with historical data by McKinsey Global Institute (2017).

These general effects also apply to the current wave of automation driven by technologies such as AI and RPA. This time, not only assembly and factory workers will be affected by the technological possibilities, but also professionals working as bookkeeping and payroll clerks, data entry clerks, or accountants (World Economic Forum, 2018; Cooper *et al.*, 2019). This is consistent to prior research that suggests a polarization of jobs as middle-wage jobs are most affected by automation while both low-level jobs that require lots of manual work (e.g., haircuts) and high-level jobs that require lots of

education are less subject to automation (Autor 2015), while contrary to that Frey and Osborne (2013) also see a high potential for automation in areas of low-skilled work. On the positive side, new roles are emerging such as data analysts and scientists, AI and machine learning specialists, information technology (IT) services, and process automation specialists (World Economic Forum, 2018). Less obvious positive employment effects might be related to new business models developed based on new technologies (Herbert *et al.*, 2017). Overall, experts estimate that the effects of emerging roles will offset the lower demand for other roles (World Economic Forum, 2018; Gartner, 2017).

#### *Implications on Qualification and Skills*

While on the macro-economic level the overall employment effect of automation might be neglectable, the situation on the level of individual employees is more complex as the new roles require a different set of skills and dedicated training. As both the McKinsey Global Institute (2017) and the World Economic Forum (2018) state, a large proportion of the global workforce will need to transition to new occupations, and thus, require significant reskilling. These estimates are accompanied by normative recommendations that individuals should get involved in educational activities, businesses should support the existing employees in their upskilling requirements, and governments should provide environments that enable the transition (World Economic Forum, 2018).

The relationship between new IT developments and the demand for new jobs and skills has been previously described and analyzed in the context of IT employees (Niederman *et al.*, 2016). When an organization adopts a new technology, there are two options: hire new employees or retrain existing employees. In other waves of introducing new technologies, these options might both have been feasible as the reskilling demands only were relevant for IT personnel that already have a general understanding of IT. However, for RPA, the situation is different: retraining a bookkeeping clerk that has no technical background at all to become a software developer is certainly more difficult, if possible at all. Therefore, in a first step, it is important to understand the specific new skills that are required to being able to evaluate the possibilities on a less abstract level.

The deployment of RPA in back-office functions might also further increase the occurrence of hybrid jobs that require expertise in both the technical and the business domain. As described by Niederman *et al.* (2016), there has already been the trend in the past that the use of technology that was previously restricted to the inner circle of IT has been moving to a larger number of users as the technology matures, which leads to more hybrid jobs.

#### *Research Gap and Need for Research*

The literature discussed above provide interesting contributions to knowledge: First of all, they explain the general relationship between automation and employment. Second, they provide insights on how

the current automation trend based on AI and RPA might influence employment. Third, they point out the general demand for new skills and reskilling requirement of the existing workforce.

However, previous research had a very broad scope in terms of industries and functions in organizations and do not focus on a particular area. Therefore, many of the findings are of a rather general nature and are not specific enough to provide guidance for organizations, managers and individuals on how they can adapt to the new reality. This paper intends to contribute to increase our understanding on these phenomena by an in-depth view on one specific area.

## DESIGN OF THE STUDY

### *Research Methodology*

This research is based on the collection of secondary empirical data, namely online job advertisements and has to be characterized as exploratory in its basic nature. Making use of secondary empirical data is common in business research (Blumberg *et al.*, 2011) and allows a standardized collection of data. The study applies a content analytical approach (Mayring, 2002), initially making use of a qualitative coding technique (Grbrich, 2013; Saldana, 2013) of job advertisements related to RPA in Germany and afterwards analyzing the findings by making use of simple quantitative statistics. The method is established and has been used in previous studies in the information systems discipline (Gallivan *et al.*, 2004; Todd *et al.*, 1995) as well as in other disciplines (i.e. Choi and Rasmussen, 2009). The major advantage of this method is the forward-looking nature as job advertisement reflect companies' predictions about what skills will be important in the future. Moreover, another advantage of the method over other methods such as interviews or surveys is not only the public availability of the data but also that data collection is not affected by socially desired answering biases, as potentially possible in interview studies (Kvale and Brinkmann, 2009). In order, to ensure credibility of this research the authors applied different mechanisms of reflexivity (Stokes, 2011; Stokes and Wall, 2014), such as procedures that both authors critically scrutinized, in a constant manner, the data collection and analysis approach by means of critical reflection and discussion.

Data was collected from the German website of the two online job platforms Stepstone (<http://www.stepstone.de>) and Indeed (<http://de.indeed.com>) on a specific date in September 2018. Both platforms are the most common job platforms in Germany. The decision was made to use several job platforms to reduce a selection bias if certain companies have a preference for a particular platform. Moreover, the sample size could be increased significantly by using more than one platform. On the other hand, when using several job platforms, redundant job ads have to be eliminated if they appear on both platforms. Based on a few exploratory search tests, it was decided that all postings that contain the exact term "Robotic Process Automation" are included in the first step. To reduce manual effort to

download and analyze the ads, we have used a web scraping technique based on a Python script and stored the data in a spreadsheet. In a second step, the records that met the following exclusion criteria were deleted: job advertisements for internships or student positions, job advertisements that were not written in German and redundant job advertisements. Moreover, search results that contained the term “Robotic Process Automation” in the advertisement but did not have a focus on RPA-related tasks were excluded manually, e.g., non-related positions in RPA software firms.

To derive the codes and categories for the content analysis, a combination of a deductive and inductive approach was used. On the one hand, certain codes were derived from theoretical considerations. For example, the most popular RPA software tools in the market were included as codes, as well as, common academic disciplines as study backgrounds. On the other hand, codes were collected inductively from the data to reflect the specific requirements formulated in the job advertisements.

Subsequently, the data records were coded in a semi-automated process with the help of spreadsheet functionalities. To assure proper data quality, the coding results were critically reviewed manually, and the search terms were adapted in a cyclical process. After the coding was completed, the data was analyzed with the help of a statistical software based on R, mostly descriptively, but also using non-parametric tests of association (Chi-squared).

#### *Sample Descriptives*

The final sample consists of 119 job advertisements. The sample contains advertisements from different industries with the majority from consulting and auditing firms (54.6 percent). Although it is acknowledged that the sample might not be representative in general, the over-proportional demand for RPA professional in the consulting sector seems plausible as many companies are implementing RPA-based processes with the help of external consultancies. Also, the large demand in the IT sector that might be related to the introduction of the tools is plausible. The strong representation of the financial services sector is consistent with the results of prior research (Willcocks *et al.*, 2015) in terms of relevant industries for deployment of RPA.

| Industries                 | Counts | % of Total |
|----------------------------|--------|------------|
| Consulting & auditing      | 65     | 54.6 %     |
| Information technology     | 13     | 10.9 %     |
| Financial services         | 13     | 10.9 %     |
| Transportation & logistics | 8      | 6.7 %      |
| Automotive                 | 4      | 3.4 %      |
| Diversified                | 4      | 3.4 %      |
| Energy                     | 3      | 2.5 %      |
| Chemicals                  | 2      | 1.7 %      |
| Retail                     | 2      | 1.7 %      |

|               |   |       |
|---------------|---|-------|
| Electronics   | 2 | 1.7 % |
| Machinery     | 1 | 0.8 % |
| Not specified | 2 | 1.7 % |

Table 1. *Industries in sample*

## RESULTS AND DISCUSSION

### *Qualification*

Stokes and Oiry (2012) highlight the importance and facets of competencies in the context of the workplace. As mentioned above, RPA involves both business and IT-related activities. Therefore, it is not surprising that companies are looking for graduates from different academic disciplines as shown in the table below. Interestingly, it can also be observed that most job advertisements mention several suitable disciplines, i.e., for the companies, it seems to be more important that the candidates have a degree at all than having it in a particular discipline. The most popular qualification, however, is an IT-related background which is mentioned in 71.4 percent of the job advertisements, followed by a business or economic degree (63.9 percent). Some of the companies (7.6 percent) do not specify the educational background and focus on required skills instead. Few companies are also satisfied with vocational training in Informatics instead of academic studies (not in table).

| Disciplines  | Counts | % of Total |
|--|--------|------------|
| Computer Sciences, Informatics, Business Informatics | 85     | 71.4 %     |
| Business, Economics                                  | 76     | 63.9 %     |
| Mathematics, Natural Sciences                        | 38     | 31.9 %     |
| Engineering, Industrial Engineering                  | 32     | 26.9 %     |
| Other  | 6      | 5.0 %      |
| Not specified  | 9      | 7.6 %      |

Table 2. *Academic disciplines*

### *Programming Skills*

The data shows that many positions require programming skills. 52 companies (43.7 percent) request programming skills –general programming abilities or a specific programming language (31.9 percent). Table 2 shows specific programming languages that are mentioned in job advertisements. The most popular languages are Visual Basic, C/C++, JavaScript, and Python.

| Languages    | Counts | % of Total |
|--------------|--------|------------|
| Visual Basic | 17     | 14.3 %     |
| C/C++        | 14     | 11.8 %     |

|               |    |        |
|---------------|----|--------|
| JavaScript    | 14 | 11.8 % |
| Python        | 14 | 11.8 % |
| Java          | 10 | 8.4 %  |
| HTML, CSS     | 9  | 7.6 %  |
| R             | 7  | 5.9 %  |
| Not specified | 81 | 68.1 % |

Table 3. *Programming languages**Software Knowledge*

Apart from programming expertise, many companies (65.6 percent) require expertise in particular software, including RPA software, and other software.

In terms of RPA software, 43 companies request skills in one or more particular tools. In Table 3, the particular tools mentioned in the advertisements are listed.

It can be seen in the figures that many of the 43 companies in the sample mention more than one tool. Although in many companies, only one type of RPA software might be in operation, the results are plausible due to the high number of consulting companies in the sample. The reason is that consulting companies do not employ the candidates for internal purposes, but for work at different clients where different RPA tools might be used. Indeed, a chi-squared test shows that among the companies that mention specific RPA tools, the consulting firms are more likely to mention several tools than the non-consulting companies ( $p < 0.05$ ).

| RPA tools           | Counts | % of Total |
|---------------------|--------|------------|
| Blue Prism          | 34     | 28.6 %     |
| UiPath              | 30     | 25.2 %     |
| Automation Anywhere | 22     | 18.5 %     |
| Other               | 9      | 7.6 %      |
| Not specified       | 76     | 63.9 %     |

Table 4. *RPA software*

Concerning other software, 26.9 percent of the companies in the sample require their candidates to have skills in one or more Microsoft Office software, in SAP ERP (19.3 percent), or other particular software (10.1 percent) such as Tableau, PowerBI, or Qlik.

*Other IT-related Skills*

Additionally, the companies in the sample require other IT-related skills as shown in the table below. 28 companies (23.5 percent) have required expertise in artificial intelligence, machine learning, and related concepts. Second, database know-how was mentioned by approximately 20 percent of the

companies which includes both general experiences with databases and specific database types and languages such as SQL, Hadoop or MongoDB. Moreover, many companies look for candidates with experience in the Microsoft .NET technology, as well as, expertise in (Advanced) Analytics.

| Other IT skills                                 | Counts | % of Total |
|---|--------|------------|
| Artificial intelligence, machine learning       | 28     | 23.5 %     |
| Databases (General expertise, SQL, Hadoop etc.) | 24     | 20.2 %     |
| Microsoft .NET                                  | 19     | 16.0 %     |
| Analytics, Data Mining, Text Mining             | 10     | 8.4 %      |

Table 5. *Other IT skills*

#### *Business and Sectoral Expertise*

Besides the technical IT skills, many companies are also looking for employees with expertise in the business field to deal with RPA. The most important aspect is expertise in business process management as mentioned by 50 companies (42.0 percent). Moreover, functional expertise in finance & accounting is important which might be an indication that most RPA projects are currently conducted in the finance & accounting function. But also, other functional areas such as purchasing or human resources are mentioned by some companies (13.4 percent).

| Business and sectoral expertise  | Counts | % of Total |
|--|--------|------------|
| Expertise in business process management                               | 50     | 42.0 %     |
| Functional expertise in finance & accounting                           | 36     | 30.3 %     |
| Functional expertise in other areas (e.g. purchasing, human resources) | 16     | 13.4 %     |
| Industry expertise in financial services (e.g. banking, insurance)     | 34     | 28.6 %     |
| Industry expertise in other industries (e.g. automotive, retail)       | 10     | 8.4 %      |

Table 6. *Business and sectoral expertise*

Also, some companies also prefer candidates with competencies related to a certain industry. Above all, specialized knowledge concerning the financial services sector is sought after by 34 companies. While 6 out of 13 companies from the financial services sector would like their candidates to have sectoral know-how, also 22 out of 65 consulting companies and 4 out of 9 IT companies have this preference. Overall, this is a strong indication that many RPA projects are currently conducted in the banking and insurance sector.

#### *Other Requirements and Competencies*

While many companies do not explicitly demand professional experience, one-third of the position requires several years of experience whereas candidates need leadership experience or competencies

for only 14 positions (11.8 percent). Expertise in traditional or agile project management methods are beneficial for 28 of the positions (23.5 percent). As also indicated by Lois *et al.* (2020), especially in the digital era, employees' skills and training can be seen as significant for the successful implementation and use of tools, while others indicate what the results of non-effective training and development approaches could be (e.g. Rowland *et al.*, 2017).

The companies also have requirements toward their candidates in terms of soft skills: more than half of the position requires strong communication skills (56.3 percent), as well as, team-orientation and capability to work in a team (53.8 percent).

Finally, mobility and willingness to travel are necessary for almost half of the positions (49.6 percent). A chi-squared test reveals that this effect is again due to a high number of consulting positions in the sample ( $p < 0.001$ ).

## CONCLUSION

### *Research synthesis*

Many of this study's findings are in line with the existing literature. For example, prior studies (e.g., World Economic Forum, 2018, McKinsey Global Institute, 2017) mention finance and accounting as an area highly affected by automation. Also, the financial services industry was mentioned by Willcocks *et al.* (2015) as an example for RPA implementation. This study confirms that financial jobs are indeed most affected by RPA. Moreover, the finding by Autor (2015) that middle-wage jobs are most affected by automation, seems to be confirmed by this study. Also, the general tenor that automation does not only destroy jobs, but at the same time creates new job opportunities, can be confirmed, which seems to be typical for every technological or structural change of the economic system.

Hence, it can be summarized that this study confirms the general direction of prior studies but provides more detailed results on specific skills and qualifications for future employment in the field of RPA, which indeed is the key contribution of this research. Moreover, this research provides a number of implications, which will be discussed in the following.

### *Implications for business practice and professionals*

Overall, it has to be emphasized that this research provides a novel and unique view on the required qualifications and expertise in the field of RPA, which provides important guidance for both business organizations and professionals in this area. It is undoubtedly, that the application of RPA will intensively grow in the future (Deloitte, 2018; Lacity and Willcocks, 2016). The study also provides an in-depth view on the German RPA labor market. Data indicate towards a number of important implications, which can be briefly summarized as follows.

First of all, it can be noted that RPA constitutes a new career opportunity for individual professionals. Although quantification of employment effects is not possible based on this study, it can certainly be said that RPA does provide an emerging career opportunity as there are many published job advertisements in this area. With 55 percent of job advertisements in the sample, the consulting sector seems to offer the most job opportunities in RPA. This is not surprising because consulting firms are often driving the adoption of new technologies in different industries. However, in terms of overall employment effects, this raises the question of whether the jobs will be permanent or only be limited for the period of the main wave of the introduction of RPA.

An implication for both individuals and organizations is that a strong IT background is required to succeed in the RPA field. Although many of the job advertisements are not very specific when it comes to particular skills requirements, it becomes apparent that a background in or at least an affinity for IT is required.

Furthermore, the study implies that finance and accounting are considerably affected. Based on both the industries in the sample and the skills mentioned in the job advertisement, it can be said that financial services sector and the finance and accounting function seem to be most affected by the changes. This does not only mean that skills in this area are relevant for prospective RPA experts, but also that people working in these areas today might be most affected by automation and reskilling requirements. This is in line with prior research that, in general, sees a huge impact of digital transformation on the finance function (Langmann, 2019; Greulich and Riepolt, 2018; Nuhn *et al.*, 2018). RPA and other automation technologies imply a major reskilling demand for the existing workforce in many organizations. However, considering the novel results of this research, the general idea and argument in many discussions, that individual employees that are affected by automation can be retrained to a position in which they supervise and operate “robots” has to be seen extremely critical. It is acknowledged that a certain percentage of the existing workforce might engage in tasks such as exception handling in an RPA ecosystem. However, most of the jobs identified in this study are in the consulting sector and thus related to the introduction of the software robot. A person that has been working as an accounting clerk for most of their lifetime will hardly be able to be trained into programming C#, for example. On the other hand, reskilling does not necessarily have to mean that the people still work in the same function (e.g. accounting) afterwards. A more realistic possibility might be to retrain an accounting clerk to work in other administrative areas, for instance in sales or HR (if these functions are not affected by automation in a similar intensity).

#### *Implications for academic teaching*

The results of this study emphasize the interdisciplinary nature of RPA, spanning for example accounting and IT. This will also lead to a further hybridization of employees' roles, that has already

been observed in the context of enterprise resource planning systems (Lois *et al.*, 2017). This interdisciplinarity should also be reflected in future curricula at universities, for example by integrating elements of the Information Systems discipline into business-related study programs and vice versa.

Continuous and lifelong learning, as well as openness towards changing circumstances will become even more important in the future. This will have a tremendous impact on educational systems and provide new opportunities for universities to offer for example part-time postgraduate programs as well as non-degree programs for employee development.

#### *Limitations of the study and potential for further research*

As every research, also this research has its limitations. First of all, this study is limited to RPA as one particular area of automation. That means that the findings might not be completely transferrable to the general discussion of the effects of automation but the authors believe that some arguments might be transferrable by means of logical reasoning. Second, the sample provides a snapshot on the labor market at a specific point in time in Germany, i.e., the results might not be generalizable beyond the temporal and geographical scope. Further sampling bias might arise from the selection of job platforms. Hence, comparative research approaches in different countries or regarding related technologies such as AI to corroborate the findings would further increase our understanding on the phenomena under study. The key findings discussed in this study can be used as research propositions or hypotheses for further studies.

Additionally, a longitudinal research design to identify further trends could be a promising avenue for further research, especially concerning the finding that the jobs seem to be largely consulting-driven, and the related question whether the career opportunities tend to be in their basic nature rather temporary or permanent. Additionally, alternative the collection of primary data, irrespective of underlying paradigms and concrete data collection methods, could considerably increase the knowledge in the field. It is beyond dispute that more research is needed, as the technological progress will continue to take place.

## DETERMINANTS OF VIOLENCE IN INDIA: ROLE OF ECONOMIC AND ETHNIC FACTORS

Shukla, Shashank Shekhar; Bhattacharya, Kaushik †

Indian Institute of Management Lucknow, India

### ABSTRACT

The paper examines what type of individuals face violence in India. We specify and estimate a probit model where the probability that a person would face violence depends on several individual, regional and institutional variables. Empirical application of this model on the IHDS data set for the year 2011-12 reveals presence of important interaction between economic and ethnic factors. We find that violence against a “backward” social group increases when it becomes upwardly mobile. In case of forward castes, a reverse pattern is seen. Among ethnic measures, fractionalization turned out to be the most important one in our study. Polarization turned out to be statistically significant only when regions affected by violent separatist or political movements were treated with a dummy variable. Interestingly, as predicted by Esteban and Ray (2011), the Gini-coefficient based on consumption did not turn out to be significant. Among other variables, political activism, access to sanitation and number of adult males in a household were important determinants of susceptibility to violence. Ongoing feuds in the village and radical or separatist movements in a state also increased the susceptibility to violence.

*Keywords: Violence, Probit Model, Interaction, Gini Coefficient, Fractionalization, Polarization*

### INTRODUCTION AND SURVEY OF LITERATURE

In the literature of social science, the topic of violence has been studied extensively. A major focus of these studies is to find out whether and to what extent conflicts among groups could be explained in terms of economic factors or factors based on identities. One strand of this literature had associated violent crimes with economic measures like income inequality (Kelly, 2000; Fajnzylber et al, 2002; Thorbecke and Charumilind, 2002; Choe, 2008; Østby et al, 2009; Nepal et al, 2011; Chintakaran and Herzer, 2012; Enamorado et al, 2016). As the association was found to be weak, subsequent literature focused its attention on ethnic measures like fractionalization (Easterly and Levine, 1997). Seminal

studies like Esteban and Ray (1994) highlighted that these measures may not capture social conflicts well and a new measure called polarization was developed by them. The second strand of the literature attempts to broaden the scope of this research and examines the determinants of civil war. Montalvo and Reynal-Querol (2005) proposed a simple measure of polarization based on ethnicity and applied this measure to cross-country data to model civil conflicts. Studies like Gasparini et al (2008), Lee and Shin (2011) and Motiram and Sarma (2014) established that polarization could be an important factor in explaining civil conflict in particular and macroeconomic environment in general. While civil war is the culmination of conflict between two groups, such conflicts typically begin through local crimes and small skirmishes targeted against specific groups. In this paper, we ask a basic question: which households become victims of violence? An answer to this question is needed from two important perspectives. The first one is of maintenance of law and order. In particular, if there is evidence that a particular region or particular identity group is disproportionately targeted, then there is need for serious introspection in the policymaking circles from the perspective of maintaining stability in the country. The second one is from macroeconomic perspective. If violence is not tackled quickly then it may destroy any conducive atmosphere needed for economic progress (Kirchhoff and Ibanez, 2001; Hughes, 2004; Bohlken and Sergenti, 2010) and may have cascading effect on performances of institutions (Greif and Iyugun, 2013).

This paper has two major objectives. The literature suggests that the relationship of violence with economic and ethnic factors could be complex and non-linear. In this context, the possibility of interaction among income and ethnicity cannot be ignored. Social scientists have also held the view that rather than poverty and deprivation, it is the competition for increasingly scarce resources such as jobs and housing during periods of increasing population growth that produced White-Black riots in the US (Olzak and Shanahan, 1996). Clearly, such competition can only take place when the deprived communities start showing visible economic improvement. One objective of this paper is to test this hypothesis.

The second objective of the paper is to test some predictions of theoretical models on conflict. The theoretical framework on conflict is available in Besley and Persson (2011) and Esteban and Ray (2011). Besley and Persson (2011) showed that peace, repression (one-sided violence) and civil war (two sided violence) were ordered states that depended on a latent variable which is shifted by shocks to the value of public goods, wages, aid and resource rents. The empirical link to conflict among groups over resources to inequality and polarization was also established firmly by Esteban and Ray (2011). In their seminal study, Esteban and ray (2011) showed that equilibrium level of conflict in an economy could be represented by a linear function of inequality, fractionalization and polarization and each could be an important covariate of conflict, the weights associated to them would depend on

the degree of publicness of the prize among groups. In particular, their model predicted that in a large economy, Gini coefficient will not explain violence well. Also, the higher the altruism, the more pertinent fractionalization and polarization be in explaining conflict, the higher the degree of publicness, the pertinent indices would be inequality and polarization.

The empirical part of this paper restricts its attention on India. In a large and multi-cultural country like India, different regions have different socioeconomic dynamics. Also, different identity based groups in India are at different levels of development.<sup>7</sup> These groups compete among themselves not only for public goods, but also for economic, political and social influence (Rohini Somanathan, 2006). In some cases, a few such groups also struggle for assimilation in the mainstream (Gail Omvedt, 1994). Historically, this competition had often led to conflict when an upwardly mobile group challenged the hegemony of the dominant group (Ambedkar, 1936). In the modern context, the unequal economic dividends from the Gulf boom that led to a conspicuous improvement in the level of living of Muslims relative to their Hindu neighbors were major sources of social tension in India (Mitra and Ray, 2014; Ray and Esteban, 2017). Another source of conflict had been the insurmountable barriers faced by some physically or culturally different groups to assimilation (Ramakrishnan and Balagopal, 1995). Urdal (2008) had examined the interaction among population, resources and violence in the Indian society. Motiram and Sarma (2014) had examined the linkage among inequality, polarization and growth. However, in the Indian context, no empirical analysis had so far been carried out on the linkages among inequality, fractionalization and polarization with violence using microeconomic data to validate the theoretical predictions of Esteban and Ray (2011).

In both Besley and Persson (2011) and Esteban and Ray (2011) violence or conflict is modelled like a “contest” game where the “contest” among groups is for public and private resources. Equilibrium level of “conflict” is then related to a set of determinants. Besley and Persson (2011) established the association of violence with shocks affecting wages and aids. In contrast, Esteban and Ray (2011) focused on the relative roles of economic and ethnological factors. A major theoretical result established by them was that the equilibrium level of per capita conflict can be approximately determined by a linear combination of Gini coefficient, fractionalization and polarization. The relative importance of these three measures in explaining conflict depends on three parameters in their model, viz., group size, group objectives (public versus private prizes) and group ability to circumvent the free-rider problem (“cohesion” or “identification”).

---

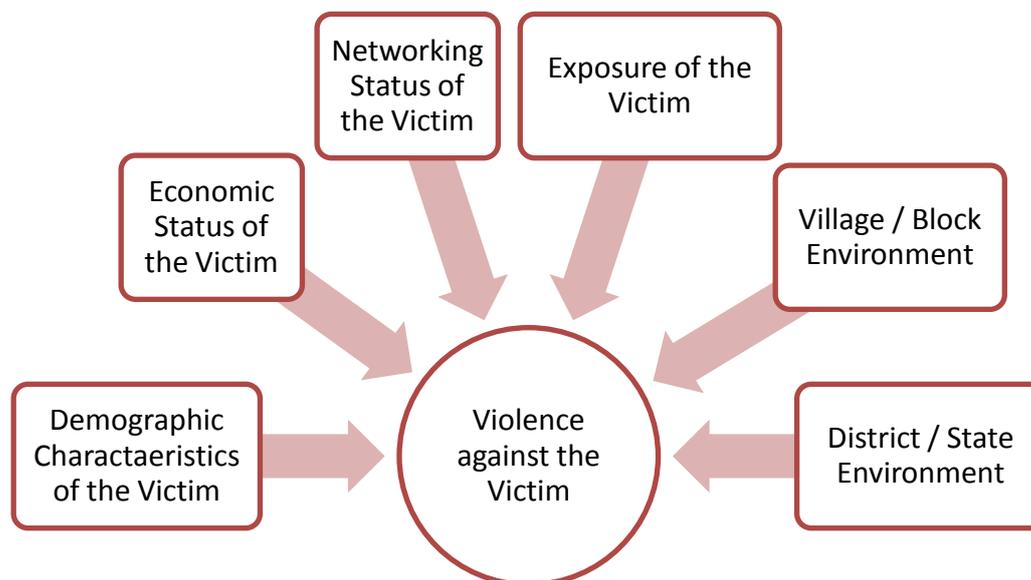

<sup>7</sup> Different levels of development of social groups in India have been documented in numerous surveys and research papers (REFERENCE OF A SURVEY) and had been officially acknowledged in official reports like Mandal Commission or Sachar Commission.

## ANALYTICAL FRAMEWORK AND MODEL SPECIFICATION

Our analytical framework in this paper is strongly influenced by the nature of the data collected in IHDS. Accordingly, our empirical strategy is guided by the theoretical framework of Esteban and ray (2011). We study the determinants of violence by specifying and estimating a probit model based on India Household Development Survey (IHDS) data. IHDS is a large-scale Pan-India sample survey that is available in the public domain. In IHDS, the variable that captures information on experience of violence by households is a binary variable. The probit model studies variations in a binary variable when the categories can be ordered. We specify a set of explanatory variables and examine whether these variables play similar or different roles in explaining violence faced by a household. The probit framework allows us to study the interactions among some of the explanatory variables. It also helps us to understand which economic or ethnic measures better explain violence against households.

Gini coefficient, fractionalization and polarization are three of these covariates along with a set of other variables that act like controls. In the absence of a clear theory on the determinants of these control variables, we specify some broad groups of variables that may affect whether a household will face violence or not. The schematic relationship is presented in Figure 1.

**Figure 1: Broad Groups of Variables Affecting Violence against a Household**

Variables reflecting identity of the victim will typically include caste and religion. These variables are immutable for a household. These variables are included because often violence may be targeted against particular identity based groups in a locality.

Economic status of the victim includes variables that reflect its purchasing power. Common sense suggests that richer the household is, less it will face violence.<sup>8</sup> Typical examples of such variables are per capita income or consumption of the household. We also include educational status as an

<sup>8</sup> A rich household may, however, be the target of robbery. We exclude this type of cases as exceptional ones.

important determinant of violence, the hypothesis being, more educated an individual is, the less would be the probability of violence against that individual.

We also hypothesize that a politically active household will face more violence. Political activism typically increases exposure of a household (compared to non-active ones) due to more interaction with other households. Hence, variables reflecting political participation and leadership role are important determinants of violence. Violence against any member of a household may take place because *ceteris paribus*, attackers get more opportunity due to certain features or exposures of the household. For example, absence of sufficiently large number of adult males in a household may make it vulnerable. Similarly, if women are forced to answer nature's call outside home due to absence of toilet in the household, they may become more vulnerable to sexual predators.

Institutional environment is also a crucial determinant of violence. The institutional environment could be at the village/block level or at district or state level. For example, at the local level, a history of feud in the village may lead to more violence in the village. Similarly, whether households of different identities are mixed or clearly demarcated may be a determinant of violence in the village. We also include a measure of crime against women at the district level as a proxy for the general law and order situation. This variable is expected to play an important role due to effectively reveal the local institutional environment. We have computed the crime rates from the NCRB database.

So far as district-level is concerned, the broad measure of level of living in a region like per-capita income (or, consumption) may also be a crucial determinant of violence. Besides level of living, we have also included a few district-level measures that capture economic inequality and ethnic tension in a district. Economic inequality in our study is measured by the Gini coefficient based on consumption of a household. Ethnic dimensions are measured by Fractionalization and Polarization as past studies demonstrate their crucial role in explaining violence in a region.<sup>9</sup> Our hypothesis is that as inequality, polarization and fractionalization increases, the probability of violence faced by a household also increases. We would also try and determine the relative effectiveness of these three measures. We have computed these variables at the district level because at the village level, there may not be sufficient number of observations to measure them correctly; in contrast, states in India are often so big and heterogeneous that the nature of dominance of specific social groups at the local level may be lost due to aggregation.

In this context, we note that the spatial context in the relationship between inequality and violence had largely been neglected so far. So far as economic and ethnic measures are concerned, there is no clear theory in the literature about the appropriate scale at which one should measure inequality and ethnicity in a population. In case of inequality, there is a long debate to what extent spatial scale of

---

<sup>9</sup> In this study, we follow the Montalvo and Reynal-Querol (2005) measure of polarization. Measure of fractionalization used in this study is the standard one.

inequality measures affect the relationship between inequality and violence. Whitworth (2013) summarizes the literature, but finds contrasting evidences across two areas, supporting the notion that local inequality measures are important determinants of social outcomes, but the larger picture of socio-political context also matters. To the best knowledge of authors, the spatial context of measures like fractionalization or polarization has not been studied yet.

As prolonged political violence due to continuous terrorist attacks or separatist movements may distort the estimates, in one of the empirical models specified in this paper, we have grouped some states that experienced prolonged political violence by three dummy variables, viz., North East dummy (7 sister states), Jammu & Kashmir dummy and Naxal dummy (combining Jharkhand, undivided Andhra Pradesh, Chattisgarh, Orissa, Bihar). The idea is to separate out states suffering from perpetual political violence for many years, with the genesis of the violence in these states being radical separatist or political movements, from other states where violence could be emanating due to other socio-economic factors.

It may be noted that many variables included in our study are immutable (e.g., variables reflecting identity like caste or religion) and cannot be changed by policy. However, many other variables like presence of toilet in a household can be influenced by policymaking. Similarly, a strong relationship between level of living and violence would reveal that policies that lead to increase in income of the population would also reduce violence. Education is one more variable in our study that can be influenced by policy.

We specified and estimated a probit model where the probability that a person would face violence depended on several individual, regional and institutional variables. We have estimated six probit models that differ in terms of explanatory variables. A Base Model without interaction terms and without variables *Gini*, *Fractionalization* and *Polarization*. Second model includes the Base Model with interaction between *Poor* and *Social Groups* but without variables *Gini*, *Fractionalization* and *Polarization*. The third model includes the Base Model with interaction between *Poor* and *Social Groups* along with *Gini*, but without *Fractionalization* and *Polarization*. Fourth model includes the Base Model with interaction between *Poor* and *Social Groups* along with *Gini* and *Fractionalization* but without *Polarization*. Fifth model includes the Base Model with interaction between *Poor* and *Social Groups* and along with *Gini*, *Fractionalization* and *Polarization*. The sixth model includes the Base Model with interaction between *Poor* and *Social Groups*, *Gini*, *Fractionalization* and *Polarization*. In this model, we also include the effect of political violence through three dummies, viz., *North East*, *Jammu & Kashmir* and *Naxal*.

## EMPIRICAL RESULTS AND POLICY RECOMMENDATIONS

In this paper, we examined what type of individuals faced violence in India. Empirical application of the six probit models specified above, on the IHDS data set for the year 2011-12 revealed presence of important interaction between economic and ethnic factors. Table 1 below provides the estimated coefficients with their standard errors along with summary statistics on goodness of fit.

**Table 1: Estimated Probit Models on Violence Faced by Individuals**

| Prob(Y=1)                                 | Dependent Variable Y: During the last twelve months, did anyone attack or threaten you or someone in your household? (1: "Yes", 0: "No") |                          |                          |                          |                          |                          |
|---|--|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|

We found that *Dalits* and *Muslims* were more susceptible to violence, but *Adivasis* were not. Interestingly, the probability of facing violence interacted with the level of living. Our analysis revealed that poor Brahmin households faced more violence compared to other social groups. Our results, therefore, suggests that violence against a “backward” social group increases when it becomes upwardly mobile. In case of forward castes, a reverse pattern is seen. The poor of these castes are prone to face more violence from other communities.

Interestingly, we found that among ethnic measures, fractionalization turned out to be the most important one in the Indian context. Polarization, in contrast to fractionalization, was not statistically significant in the probit model that included data of all states. However, when regions affected by violent separatist or political movements in India (e.g., Jammu & Kashmir, North East and states severely affected by Naxal movement) were treated in one of our probit models with a dummy variable, polarization turned out to be a significant factor. It may be noted that these regions in India typically had high violence with low ethnic polarization at the local level. Hence, these states acted like outliers in our model. Once they were separately treated, polarization also turned out to be a significant factor in explaining violence. Interestingly, as predicted by Esteban and Ray (2011) in their theoretical model on determinants of conflict, we found that in a large country like India, the Gini coefficient based on consumption was not an important determinant of violence even if the measure is computed at the level of a district.

Following Esteban and Ray (2011), we may conclude that the important relationship between fractionalization and violence in India suggests that a major source of conflict in India could be due to sharing of private goods. For example, a conspicuously biased distribution of jobs and sops among communities could be the main bone of contention that culminates in violence. Concerns over public good could also explain violence once the outliers are excluded from our model. Some of the bones of contention here could be roads, common water resources, street lighting and security. If specific groups are systematically deprived of these facilities or are not allowed to enjoy them even when they are available for others, movements of members of the excluded communities to have them may result in violence. Among other factors that explain susceptibility to violence, political activism, access to sanitation and presence of large number of adult males in the household are important ones. Political

activism increases the probability of attack due to more exposure whereas access to sanitation in home reduces such exposure in case of women. Presence of large number of adult males in a household could act like a deterrent against violence.

Finally, the general political milieu in a state were important determinants of violence in our model. Naturally, violence was observed to be more in the regions of India afflicted by terrorism or by violent separatist movements. For example, individuals living in J&K, North-East and Naxal affected states in India experienced more violence compared to residents of other states. It may be noted that a violent political movement in a state could be drawn on ethno-religious lines. However, ethnic polarization measures based on district will be low in these states. The literature does not clearly indicate what should be the appropriate spatial scale of these measures. In the absence of a clear theory, we may interpret at least two of the three significant dummies in Model 7 (e.g., North East and Jammu & Kashmir) in terms of polarization measured at a broader level.

Our results suggest that apart from direct policy interventions like better policing, a few indirect strategies could play effective role in reducing violence in India. For example, access to sanitation in home is expected to reduce a lot of sexual predatory attacks against young women. Importantly, as increased average per-capita income has a big role in reducing violence in a region, policies that enhance growth would be a good bet to reduce violence in that region. Similarly, overall increase in educational level could also reduce violence in a region. In contrast, inequality reducing general Pigou-Dalton type transfers redistributions from rich to poor may have only a limited impact of violence. In the Indian context, apparently the ethnical variables are more important determinants of violence than economic inequality.

We also postulate that complexities of interactions of these identity based variables with level of living would render “one size fits all” type of policies irrelevant in the Indian context. Local ethnic factors, upward and downward economic mobility of specific groups, existing village-level or broader feuds would shape the course of violence for years to come.

### ABSTRACT

The 21st century is defined by the profound and structural changes in the key systems of communication. The emergence of social media has placed visual content at the forefront of marketing and communication in unprecedented ways. The debate around visual culture has been of central interest to the ongoing analysis in academia, and it is still very much a dynamic and complicated matter. In this new environment, Instagram holds a prominent role. The current study examines the relationship between age and the perceptions of Greeks towards the influence of Instagram on their aesthetics, as well as gender effects on the use of the platform's trends. Statistical analysis is utilized to examine the hypothesized effects. Theoretical contributions and implications for those in charge of planning and realizing digital marketing and communications programs are discussed.

*Keywords: Visual Culture, Aesthetics, Instagram, Instagram Filters, Gender, Age, Instagram Trends, Marketing Communication*

### INTRODUCTION

The distinguishing mark of the 21st century has been the emergence of the age of image and information. This century's defining characteristics have been the profound and structural changes we have experienced in the key systems of communication (Papathanassopoulos, 2000). The emergence of social media has placed visual content at the forefront of marketing and communication praxis in unprecedented ways (Stavrianea and Kavoura, 2015). As discussed by Papathanassopoulos (2000), the ways in which the media have been transformed correspond directly to the wider changes our society is undergoing. In recent years, the debate around visual culture has been of central interest to the ongoing analysis in academia, and it is still very much a dynamic and complicated matter. The term 'visual culture' corresponds to what can be seen - the 'visible' (Becker, 2017). It correlates with circumstances and states within the cultural and social context of our society. Our cultural and media terrain is shaped by and, in turn, influences contemporary visual culture. Images, as well as social media, play a pivotal role in this process.

Instagram - the online network which was established in 2010 - is centrally positioned within this emerging virtual landscape. Here the focus is on images and visual content. As Hochman and Schwartz (2012) explain, the individuals who use the platform post images and audiovisual content on their Instagram profiles. This, in turn, affects contemporary societies in different ways and has an undeniable effect on today's visual cultures (Cara, 2019). One dimension of visual culture is particularly affected, notably aesthetics - a term that corresponds to how images are observed and interpreted (Jamieson, 2007). It appears that Instagram established its following and prevalence from its very early stages and continues to expand steadily to the present day ((Pavlicek and Syrovatkova, 2020; Statista, 2019). Instagram's popularity has rendered the platform particularly interesting to most marketing and communications executives (Pavlicek and Syrovatkova, 2020; Business of App, 2019; Jaakonmäki et al., 2017). Instagram's effect on contemporary social networks, on the expression of the individual and the self-esteem of the user, has been explored by previous research (Manikonda et al., 2015; Cornet et al., 2017). Additional work is nevertheless required to evaluate Instagram's effect on the development of visual culture for users - an area of study that remains under-researched (Howells and Negreiros, 2019). Certain aspects of the profile characteristics of Instagram users, particularly age and gender, have been widely researched (Kim and Kim, 2019; Shane-Simpson et al., 2018; Thelwall and Vis, 2017). Though, more in-depth study is required regarding the relationships between age, gender, and Instagram trends and filters used.

Therefore, the following research topics need to be addressed:

RQ1: Does age influence the beliefs of Greek users regarding the effect of Instagram on their aesthetics?

RQ2: What are the reasons for which Greeks use Instagram filters?

RQ3: Does gender influence the use of Instagram trends?

This research examines the effect of age on the beliefs of Greek Instagram users on the aesthetic aspect of visual culture. Furthermore, it explores the dependence of the visual tools of Instagram, such as the use of trends, with gender.

This study is presented with the following structure in mind: the initial parts engage with the presentation of the theoretical background and the prior work done on the field study. Following that, the methods and findings are discussed. The paper concludes by considering the significance of the findings as well as by suggesting and examining routes for further research.

## LITERATURE REVIEW

As explained by Mitchell (1994), extensive research from different perspectives has been carried out on the subject of visual cultures over the past decades. This research field has been at the center of inquiry from varying scientific disciplines. Nevertheless, it continues to be a highly nuanced field of study, one

which presents the researcher with a high level of sophistication and a subject around which there is still extensive ongoing debate. In addition to pointing out the necessity for more detailed and analytical work to be done around the field of visual cultures, Becker (2017:151) highlighted the complex nature of what is understood under the concept of 'visual culture': on the one hand, the term implies the study of "the things that are seen", but what makes it particularly thought-provoking is the fact that, by definition, *visuality* is thus imbued with the attributes of social interaction. Social and cultural requirements render the "visible" a necessity, and the conditions are created for particular phenomena or events to be made available so that other individuals can "see" them (Becker, 2017).

The idea of visual culture is without a doubt far-reaching and complex, and as a result, researchers approach it from different angles, using a variety of interpretations regarding its meanings. It has been described as "any visual event that provides information, meaning, or pleasure when the viewer comes into contact with visual technology, which is designed to improve physical vision. The visual culture is interested in the sense of sight and its role in the production of meanings, the formation of aesthetic values of social stereotypes, and social relations" (Mirzoeff, 1998:3). Essentially, Mirzoeff's description introduces the dimension of social interaction and communication to the concept of visual culture and defines this as the connection between the visual and knowledge.

The idea of visual literacy is inextricably linked to that of visual culture and is of pivotal significance in these image-dominated times. The concept of the "grammar" of a visual text has been used in the past (Kness and Van Leeuwen, 2001), claiming that the visual medium constitutes a highly evolved way of communicating with each other (Yenawine, 2016).

According to Sifaki (2015), what is of paramount importance when considering images is not merely how they appear to others, but rather how they decipher them. Visual texts present ambiguity and intricacy, which arises from the fact that images may be perceived in different ways and may indeed present certain difficulties in their interpretation. Not all individuals and communities have the same outlook and standpoint in this multifaceted and multicultural world. Discussing from this frame of reference, Goldman (1975:107) emphasizes the concept of a "world-perspective," a concept that can be understood as "a mixture of ideas, ambitions, and emotions." Furthermore, he stresses that each community of given people has a particular "world-perspective" shared solely by the members of the group (Goldman, 1975). A society should not be defined by any particular cultural text unless it originates from the particular social group that developed it. Therefore, it represents a shared and commonly-understood world-perspective (Howells and Negreiros, 2019).

Our modern cultures and societies have, in recent years, been defined by the fundamental role which the social media have played in defining and shaping our cultures. At present, images play a central role in influencing visual culture and marketing communication, and all this is played out in the

context of our very heavily populated social media. In this context, Instagram represents a freely available virtual social networking site through which users have the opportunity to share visual material as well as videos and post them on the Internet through the use of the various networking platforms (notably: Facebook, Flickr, Twitter, and Tumblr). This type of social media defines visual culture as images become framed around the platform's aesthetic component - how the images are framed, the filters used, and a variety of trends that become prominent among users (Leaver et al., 2020).

A broader approach of aesthetics refers to the sentiments and judgments that an individual has when coming in contact with arts (Blacburn, 2005; Buschgens et al., 2018). Aesthetics is a part of visual culture regarding how a person perceives images (Jamieson, 2007). Therefore, aesthetics is associated with each person's cultural influences, personal inclinations, and subconscious (Jamieson, 2007). Marketing literature suggests that branding draws upon different processes, including visual aesthetics (Wu et al., 2013; Buschgens et al., 2018). Mesquita (2010) argues that the user's aesthetics are affected by the ways in which the visual content is positioned. The framing around the images also plays a role in this context. Moreover, the person's aesthetics may also be influenced by the unique features offered by Instagram - features that improve and add to the way in which the image is communicated. In each case, the user profile is organized in specific ways by placing images next to one another, thus establishing links, similarities, and narratives that suggest a connection. Where the surrounding elements of the image to be changed, this would in turn modify the significance of the message being conveyed. As Manovich suggests (2016), the elements which accompany the image can detract from or enhance the effect it will have.

With regard to the ways in which Instagram can 'frame' images, the platform uses three types of template models. The process of trimming the frame in which a photograph was originally placed, and in essence, creates a different image, a "meta-image." Likewise, a photograph's aesthetics are inevitably affected by the mass production of images which then appear in precisely the same frame type as all the other images (Manovich, 2016; Bakhshi et al., 2014).

A wide range of filters is also provided by Instagram. These give users the option to edit and alter the images that they choose to post on the platform. A filter is an automated image editing setting. This means that applying a filter offers automatic adjustment of brightness, saturation, contrast and color editing of an image (AlShehri et al., 2020). The variety of filters is large and is constantly updated. The systematic use of certain filters can significantly affect the aesthetics of a culture. Hochman and Schwartz (2012) compared a large sample of images uploaded to Instagram from two cities: New York and Tokyo. The results showed that the vast majority of images uploaded from New York had cold colors and the ones from Tokyo warm. All filters are made available to every single user, and a number

of them are used extensively (Jaakonmäki, 2017). In addition, it is known that images showing faces are the ones that, as a rule, have a tendency to attract the largest number of comments and likes (Bakhshi et al., 2014). The key reasons for using filters have been researched by Bakhshi et al. (2015), and the findings confirm that primary among them is the idea that once filters are added, the image's aesthetics will be enhanced. The color and the lighting of the picture can have an impact on the kind of atmosphere that the image conveys. According to Bakhshi et al. (2015), the vintage/retro look of a monochrome black and white or sepia image is assumed by many users to create an attractive aesthetic. Additionally, changing a photograph's colors and the automatic alteration of warm tones to cold and back again, as well as the possibility of creating completely different, more powerful, images, are further motivations for using filters. In addition, the use of filters deepens how the user connects with the image. It is clear that any edited visual material appears to receive overall more comments and likes (Bakhshi et al., 2015).

Ultimately, there are clear patterns that we notice emerging through Instagram, and these are welcomed and supported by a significant number of people and communities. Instagram trends affect gastronomy (Anggadwita et al., 2020), product placement strategies, or body type standards (Pavlicek and Syrovatkova, 2020). Sometimes these trends are just filters, that adjust on an image or a video and affect its aesthetics; such a trend is the Fine-line sketch that constitutes one of the most prominent trends of Instagram during 2020 (Schneider Media, 2020; Canning, 2019).

Research carried out in recent years has established the forces at play in considering Instagram to be a type of marketplace for discussing and connecting through textual and visual media (Lusch and Watts, 2018; Schops et al., 2020). Valentini et al. (2018) have also considered the impact visual messages have on people using Instagram and the effect on purchase intention that visual communications may have. Further research has demonstrated that Instagram influencers who are older participate in the creation of cultural meaning through their image and personality. It is believed by Buschgens et al. (2019) that branding within visual aesthetics facilitates the creation of communities that can be described as transnational.

Therefore, studies regarding the influence of Instagram on visual culture are very limited, and to our knowledge, no research examining gender preferences on the use of Instagram trends was found. Based on the previous research questions as well as the beforementioned literature review, this study aims to address the abovementioned research gaps and provide more in-depth understanding on the formation of the aesthetic dimension of visual culture, through the use of Instagram, and examine the possible relationship with age, and also, to advance our knowledge on the trends of Instagram in relation to gender preferences. Specifically, the current study aims:

- 1) To examine age effects on the perceptions of Greek users regarding the influence of Instagram on their aesthetics.
- 2) Explore the reasons for using Instagram filters and
- 3) Examine whether gender affects the utilization of Instagram trends.

## METHODOLOGY

A questionnaire that measured Instagram use and perceptions of users towards its influence on aesthetics and visual culture were developed especially for this study based on prior research (Jamieson, 2007; Bakhshi et al. 2015, Manovich, 2016, Cara, 2019) and in-depth interviews. Due to time and economic limitations, the sampling procedure employed a combination of non-probability sampling methods. More specifically, convenience sampling was used -through a Facebook account providing an invitation to acquaintances to participate in the study-, along with snowball sampling and criteria according to Stavrianea et al. (2020) procedure. In order to participate in the research, the following criteria had to be met: First, of all, the individual had to be an Instagram user and second, not be a digital marketing professional. A total of 265 valid questionnaires were gathered from December 1 to December 28, 2019. The study constitutes a part of a larger research, and as far as questions referring to the influence of Instagram on users' aesthetics, ratings were on a five-point Likert type scale. Data analysis included descriptive statistics and chi-square test. For the chi-square, all tests were set at  $\alpha=0.05$ .

## RESULTS

### *Sample Demographics*

Of the 265 respondents, 46% were male, and 54% were females. Ninety-three participants (35%) belonged in the 18-24 age group, 102 respondents (38.5%) belonged in the 25-34 years old group, and 70 respondents (26.4%) were over 35 years old. Regarding the sample's educational level, 9.1% of the respondents had secondary education, 27.9% were undergraduate students, 39.6% were university graduates, and 23.4% had postgraduate education.

### *The influence of Instagram on aesthetics, the reasons to use filters and follow trends*

24.2% of the respondents believed that Instagram influences their aesthetics greatly and very much 26.8% of the participants believed that Instagram has affected their aesthetics in a moderate way; 24.2% believes that the platform has influenced their aesthetics a little and 24.8% that it has not affected their aesthetics at all. In an attempt to further examine one visual tool of Instagram, filters, results showed that 28.3% of the sample does not use the filters in the visual material that they publish, 26% do not use

them at all, 22.6% make neutral use of the filters. In contrast, 16.6% use them a lot. Concerning RQ2,-the use of filters in the visual material published on Instagram by the Greek users was explored. Initially, the three main reasons came to the surface as to why Greeks use filters in the content they post on Instagram. Users believe that filters make the images look more atmospheric (46%), the quality of the image is improved (30.9%), and photos look more professional. (19.6%). Of the research participants, 16.2% use filters because this tool is available, and 3% because it is fashionable. On the contrary, amongst non-users of filters, responses show that they avoid using them because they make images look unnatural (30.9%), alter image quality (24.2%), have a very intense effect (18.9%), and everybody is using them (15.8%).

In addition, the use by Greeks of the most popular Instagram trends was examined in this research (fine line sketch; puzzle layout; color blocking; #nonfilter photos; monochrome layout; retro layout). Results showed that the most popular trends among users are #nonfilter photos (20%), followed by retro (16.6%); monochrome layout (9.4%); color blocking (4.5%); fine line sketch (4.3%); puzzle layout (2%), while 61% answered that they do not use any of the above trends.

#### *Hypotheses testing*

Based on RQ1, the following hypothesis was tested:

H1: There is no association between Instagram's influence on user's aesthetics and age ( $\alpha=0.05$ ).

The hypothesis is presented as follows:

H10= There are no statistically significant differences between participants' age and the-influence of Instagram on their aesthetics ( $\alpha=0.05$ ).

H11= There are statistically significant differences between participants' age and the influence of Instagram on their aesthetics ( $\alpha=0.05$ ).

Based on RQ3, the subsequent hypotheses were tested:

H2: There is no association between the use of fine line sketch Instagram trend and gender ( $\alpha=0.05$ ).

H3: There is no association between the use of puzzle layout Instagram trend and gender ( $\alpha=0.05$ ).

H4: There is no association between the use of color blocking Instagram trend and age ( $\alpha=0.05$ ).

H5: There is no association between the use of #nonfilter photos trend and age ( $\alpha=0.05$ ).

H6: There is no association between the use of monochrome layout trend and age ( $\alpha=0.05$ ).

H7: There is no association between the use of retro layout trend and age ( $\alpha=0.05$ ).

In order to examine the above hypotheses, the chi-square test statistical criterion was used after meeting the necessary requirements. Results showed that age affects the influence of Instagram on participants' aesthetics (RQ1), since  $\chi^2_1 = 19.524$  ( $p = 0.012$ ). Thus, the null hypothesis is rejected. Specifically, cross-tabulation tables showed that older users believe they are less influenced by Instagram on their aesthetics than the younger ones. As for RQ3 the results indicated that gender

affects solely the use of color blocking trend  $\chi^2=9.569$  ( $p= 0.02$ ) and the use of fine line sketch trend  $\chi^2=5.914$ ;  $p= 0.015$ ). Specifically, women seem to be more likely to use the Instagram color blocking trend, while men are more likely to use the fine line sketch trend.

## DISCUSSION – CONCLUSION

The current study provides significant insights that enable researchers to understand better the formation of an important aspect of visual culture, aesthetics. Specifically, the study explored the influence of Instagram on users' aesthetics and results showed that the participants in the study believe that the medium moderately influences aesthetics. It is important, though, that younger respondents believe that their aesthetics is affected more by Instagram, than individuals who belong in the older age groups. The results of the study also indicated the reasons for which Greek users utilize one of Instagram's tools, filters. The findings align with prior research (Bakhshi et al., 2015) that also supported the use of filters to create atmospheric images and improve quality and colors.

Finally, results showed that the use of some Instagram trends is related to gender and that the color blocking is mostly used by females, while males are more likely to use the fine line sketch trend.

The results of the study contribute greatly to those in charge of planning and implementing marketing and communications programs that integrate social media and Instagram. A more in-depth understanding of users' preferences on Instagram tools, and also, selections in regard to gender, enables marketers to design more effective messages and tactics and to better target and engage users, gaining in that way a competitive advantage.

Albeit its contribution, the study is not without limitations, which also constitutes directions for future research. The study used a non-probability sampling method, and also, the sample size is relatively small, since there were time and economic limitations. Future research could employ the use of random sampling and a larger sample in order to validate the results. The current study examined the perceptions and preferences of Greek Instagram users. Future research could examine the influence of Instagram on aesthetics for individuals with different cultural and geographical backgrounds. Nevertheless, despite the above limitations, the study offers valuable insights and practical implications on the impact of Instagram on modern aesthetics and users' preferences.

### ABSTRACT

Upscale hotels' loyalty, intention to rebook, and willingness to recommend are important success indicators for hotel performance. The focus on the customers' complaints and negative experiences may provide useful insights to hotel managers on the way to deal with the latter. This paper aims to pinpoint the main variables explaining the e-reluctance to book over, and the e-direct and indirect disloyalty of customers. The methodology consists of qualitative research through content analysis applied to a corpus of 730 reviews sampled from a total of 23593 e-generated opinions, and 19 cases of upscale hotels in Seoul. The data was collected through booking.com, one of the leading hospitality and tourism platforms, and coded manually by the usage of QDA miner software. The work concludes that specific hotels' attributes, major vectors in terms of complaints, are salient factors to be considered for effective management of upscale hotels.

*Keywords: Disloyalty, online reviews, link analysis, upscale hotels, Seoul, complaints*

### INTRODUCTION

Several online platforms encompassing self-uploaded customers' reviews are nowadays available, and free to be accessed and to be used by hotel managers and academicians. A considerable literature has analyzed, in different fashions, the latter databases, many of which provided theoretical and managerial implications (Crompton, 2000; Lai 2019; Jani & Han, 2014). The major pathways of previous researches brought light to the following couples, 'review-valence/ hotel performance' (Li et al., 2017., Xie et al., 2014; Liu & Park, 2015; Zhou et al., 2014; Torres et al., 2015; Fang et al., 2016; Xie et al., 2017); 'opinion-mining/ future intentions' , and 'e-satisfaction/ e-loyalty' (Lai, 2019; Castro et al., 2007; Crompton, 2000; Murphy et al., 2000; Mody et al., 2019; Jani & Han, 2014.)

Little prior research of the previously reviewed papers has focused on the keys behind disloyalty and hotel performance (Hu et al., 2019., Dunsun & Cabir, 2016). However, the link between disloyalty and complaints about tourists' stays have not been exclusively considered previously by scholars. Therefore, this paper applies a content analysis on a corpus of data collected from one of the largest e-generated review platforms in hospitality and tourism 'booking.com,' of 19 high-end hotels in Seoul. It aims principally to analyze existing customers' online negative opinions of hotels' services in the

studied region, where more than 26 percent of the latter are 4 and 5-star hotels; and intends to give insights to hospitality managers on the crucial attributes explaining the main critical factors behind customers' negative futures intentions.

## LITERATURE REVIEW

Over the last decade, extensive literature focused on hotel customers' online reviews and opinions. Three main directions are identified. The first is on the importance of online reviews and their impacts on customers' trust and intention to book or to reuse, thus on the relationship and connections between the user-generated data and the potential future attitude. The second area of the literature is business-focused, which measures the effect of online reviews on hotel performance. The last area is centered on customer satisfaction and loyalty.

### *Tourists' e-WOM and opinion mining*

Online travel and tourism platforms, as well as social media, have become the main tools of e-WOM and uploading self-experiences' evaluations and comments. Several studies have used those collected online databases to research numerous issues directly linked to both the customers and the companies. The principal directions are resumed in the impact of online reviews' valence on customers booking intentions (Xie et al., 2014; Liu & Park, 2015; Zhou et al., 2014; Torres et al., 2015; Fang et al., 2016; Xie et al., 2017), the importance of e-generated opinions on hotel performance (Lui et al., 2018; Xie et al., 2014; Zhou et al., 2014) as well as the value of e-reviews for practitioners and managers (Chan et al, 2017; Mellinas et al, 2019; Lee et al, 2018; Banerjee et al, 2019; Pelsmacker et al, 2018; Zhao et al, 2019; Hu et al, 2017; Geetha et al, 2017; Xu et al, 2016).

Positive and negative online reviews have significant impacts on potential customers' future behaviors (Mauri & Minazzi, 2013), their trust on hotels (Sparks & Browning, 2011; Sparks et al., 2013) and on the popularity of the tourism product (Tran et al., 2019), as concluded in the study of Zhang et al. (2010). Ye et al. (2011) assert that online reviews impact considerably and positively on online booking of hotels, with a ratio of 50 percent. However, the latter study considered, uniquely, the Chinese market and product, the numerical finding is not to be generalized. In the same line of thoughts, it was argued that the most recently added negative online reviews are more likely to be the ones influencing customers' intention to buy (Sparks & Browning, 2011). Therefore, the dates in which the reviews have been published impact considerably on the customer decision-making process. Researchers' studying online customers' opinions have been aligned in terms of findings and conclusions as to factors behind consumers' intentions to book hotels online (Agag & El Masry, 2016; Chan et al., 2017; Tran et al., 2019; Ahmad and Sun, 2018), with review valence significantly impacting on future behaviors (Chan et al., 2017). Basically, trust on online customer feedback becomes stronger

in specific situations of demographic and preferences' similarities between the reviewers and the potential customers (Chan et al., 2017; Tran et al., 2019). 'Commitment,' 'trust,' and 'customer's attitude' are the significant moderator variables of the intentions to book hotels online, especially for customers with low-habit. (Agag & El Masry, 2016). The opposite is also correct (Ahmad & Sun, 2018), with fake identities positively influencing distrust of potential customers' booking behavior.

#### *Customer satisfaction and loyalty*

In addressing issues surrounding business value and hotel performance, the main challenge for managers is to understand customers' actual and future behaviors. Bosque et al. (2006), in conducting research into UK travel agencies, concluded that managers should understand satisfaction as an essential determinant of loyalty. They asserted that user satisfaction not only generates loyalty but also leads to positive word-of-mouth (WOM), thus communications encouraging potential users to request information. Managers, therefore, should seek to maximize the satisfaction of their customers. The latter statement is more applicable in, nowadays social-era, with the open access to self-uploaded e-WOM from the side of customers.

Bigné et al. (2005), compared two competing models of the impact of emotions on satisfaction, willingness to pay more, and loyalty. According to their findings, the strength of the direct effect of pleasure on loyalty is similar to that of satisfaction. It is an indication that the (physiological) experience of happiness by itself creates loyalty so that both the promise of pleasure and satisfaction need attention. It may thus be helpful to assist visitors in remembering the experience through after-sales services such as replies to online reviews, which continue the physiological pleasure to bolster the word-of-mouth. In the same line of thoughts, Lee and Park (2019) studied the relationship between customer delight, equity, and loyalty in high-end hotels (Lai & Hitchcock, 2017). Their study concluded that managers need to focus on enjoyment as it has a positive influence on customer commitment and fidelity.

Baker et al. (2000) argue, in their research on tourists' satisfaction and behavioral intentions, that high-performance quality and levels of satisfaction are perceived to result in increased loyalty and future reuse, greater acceptance of price increases and an enhanced reputation. Greater comfort will be generated where expectations coincide not only with perceptions but also with interests and attitudes. Similarly, according to Han and Hyun (2017), on their research applied to hotel-restaurants, the overall quality related to products and services play a decisive role in satisfaction.

In addition, expectations can be influenced by different elements such as past experiences, the customer's self-perceived competency (Xiang et al., 2015), the service of other providers from whom the customer can obtain service, what customers hear from other customers and external communication from the service provider (Xie et al., 2017; Lui et al., 2018). The latter includes a wide

variety of direct or indirect messages conveyed by service firms to customers from which managers' responses (Li et al., 2017; Sparks et al., 2016; Xie et al., 2017).

Scholars have adopted diverse approaches to address the problems and issues surrounding customer loyalty for the hotel industry. Lai (2019), studied using a structural equation, the principal factors which are playing roles in building customer loyalty. The results of the recently mentioned study show that hotel image, service quality, perceived value, customer satisfaction, hotel reputation, and customer commitment are the major factors behind customer loyalty. Similarly, Jani and Han (2014) argued that satisfaction had a significant impact on guests' loyalty and that extraversion, agreeableness, and neuroticism significantly affect satisfaction.

Besides, Mody et al. (2019) have focused their research on authentic experience and its impact on brand loyalty, in a study applied on hotels and Airbnb, through two directions 'the brand pathway' and 'the experience pathway.' Gao and Lai (2015) have studied transaction-specific and integrated-specific satisfaction's effects on resorts, and have stated that the integrated one has a substantial direct influence on customer loyalty. The results, although applied on a cumulative products' basis, is considered as part of this literature, as even in the case of luxurious hotels in urbanized destination the integrated satisfaction needs to be considered as a primary measure tool than the overall satisfaction itself.

Determining factors of satisfaction and dissatisfaction are proved to be different from one hotel type to another based on starring (Xu & Li, 2016). Indeed, Hu et al. (2019), concluded through their research on complaints and dissatisfaction, that service problems and pricing are the primary reasons for customers' complaints in upscale hotels.

Therefore, most of the literature reviewed is focused on satisfaction and e-satisfaction and the impact of the latter on the intention to rebook as well as on indirect loyalty. The lack previously mentioned, raises the main research question which seeks the critical variables associated with dissatisfaction as well as the link of the latter to disloyalty in upscale hotels in the urbanized city.

## **DATA COLLECTION AND ANALYSIS**

This study aims principally to pinpoint the main attributes linked to customer dissatisfaction and customer disloyalty in upscale hotels in Seoul, South Korea.

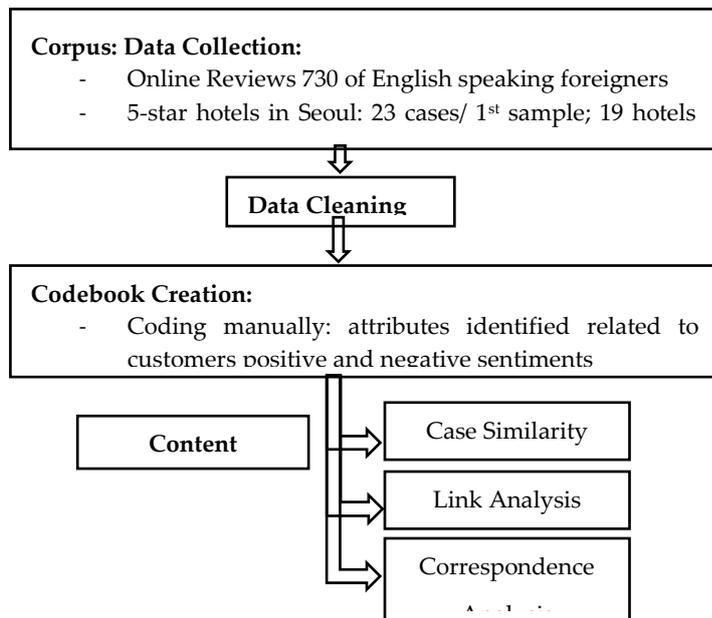

Figure 1. *Research Framework*

#### *Data acquisition and preparation*

The data was collected through booking.com, as it is one of the most significant and trusted platforms in the hospitality industry. The main selection criteria are:

- Star rating and geographical location: all the hotels studied are rated five-stars and situated in Seoul;
- Foreign English-speaking reviewers: During the cleaning process, all the Korean reviews, although written in English, has been deleted from the original corpus. The latter is related to the fact that the study focuses on perception held by foreigners and not nationals.
- Period: February 2017 to January 2018 (the only exception is Four Seasons, as all the reviews were in 2018).

The corpus of data accounts 19 cases, all five-star hotels situated in the capital Seoul. A total of 730 reviews were sampled from initial total reviews of 23593 and 12642 in English, according to the criteria previously mentioned (refer to table 1).

| Cases | Total Rev | English Rev | Jan-18 |
|-------|-----------|-------------|--------|
| C1    | 367       | 198         | 11     |
| C2    | 2062      | 1247        | 55     |
| C3    | 1075      | 716         | 87     |
| C4    | 775       | 401         | 11     |
| C5    | 1655      | 1024        | 44     |
| C6    | 345       | 174         | 55     |
| C7    | 124       | 34          | 34     |
| C8    | 1019      | 368         | 25     |

|     |       |       |     |
|-----|-------|-------|-----|
| C9  | 1039  | 740   | 55  |
| C10 | 3497  | 1488  | 55  |
| C11 | 1895  | 1126  | 45  |
| C12 | 77    | 37    | 23  |
| C13 | 771   | 392   | 34  |
| C14 | 1325  | 909   | 35  |
| C15 | 1548  | 863   | 47  |
| C16 | 1276  | 880   | 15  |
| C17 | 1717  | 616   | 31  |
| C18 | 2683  | 1377  | 57  |
| C19 | 343   | 52    | 11  |
|     | 23593 | 12642 | 730 |

Table 1. Codebook 1 – Sampled cases

*Data analysis*

Content analysis is applied by the usage of the QDA Miner and Wordstat software for qualitative and quantitative analysis. A three-step process is applied at this stage; the first is cleaning the data, which consists on deleting useless information such as ‘nationality,’ ‘names,’ and ‘managers’ responses,’ as they are not evaluative components. The second step was to code the 19 documents of the corpus manually and to process with the identification of the codes gradually (refer to figure 2). A total of 22 codes were pinpointed, all of which are complaints’ related, negative intentions to rebook and non-convenient surrounding (refer to table 2).

| Codes | Codes descriptions                      |
|-------|---|
| SC1   | Room-related complaints                 |
| SC2   | staff communication complaints          |
| SC3   | Lobby- related complaints               |
| SC4   | Food and beverage- related complaints   |
| SC5   | Staff- related complaints               |
| SC6   | Location- related complaints            |
| SC7   | General- related complaints             |
| SC8   | price-related complaints                |
| SC9   | service- related complaints             |
| SC10  | amenities- related complaints           |
| SC11  | Front office-related complaints         |
| SC12  | Cleanliness-related complaints          |
| SC13  | Expectation unmet                       |
| SC14  | Wellness and comfort-related complaints |

|      |                                |
|------|--------------------------------|
| SC15 | Maintenance-related complaints |
| SC16 | Free extras inexistent         |
| SC17 | Decoration-related unhappiness |
| SC18 | Overall quality bad            |
| SC19 | Signage-related complaints     |
| SC20 | Customer value bad             |
| LN   | Intention to never return      |
| SE-B | Bad location                   |

Table 2. Codebook 2 – Variables and codes

Besides, the content analysis used one-tailed significance and was based on coding by variable, as well as column percentage per case. Regarding the link analysis, the multidimensional scaling options applied are with tolerance 0.01, and a maximum iteration of 50 and using a classical scaling. The link analysis was applied to the 22 codes under the code-occurrence. The following formula was used:

$$\text{Similarity} = \cos \theta = \frac{A \cdot B}{\|A\| \|B\|} = \frac{\sum_{i=1}^n A_i B_i}{\sqrt{\sum_{i=1}^n A_i^2} \sqrt{\sum_{i=1}^n B_i^2}}$$

Furthermore, although the percentage of good reviews and satisfied customers is over the dissatisfied ones, the authors have considered all the sampled reviews for the final analysis. In fact, it is preeminent in this study to recognize the complaints of unhappy as well as of happy customers (As shown in Figure 2).

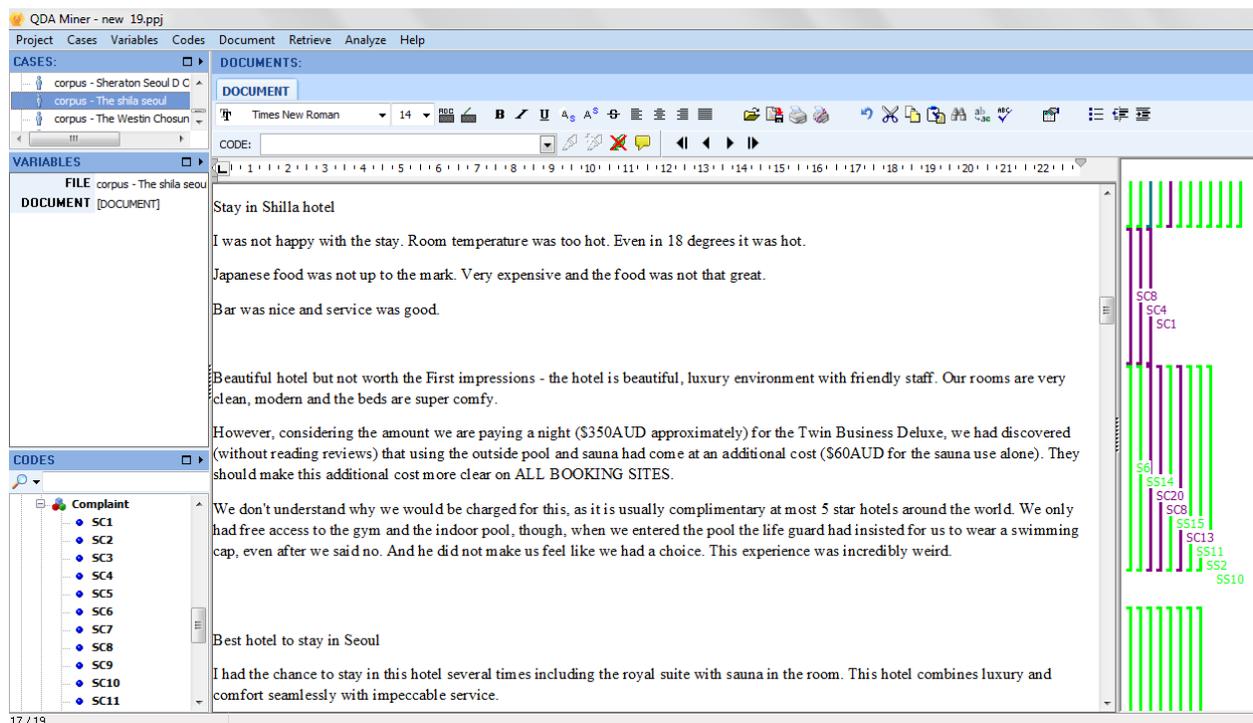

Figure 2. Manual coding processed - example

## RESULTS AND DISCUSSION

### *Cases similarity and Codes similarity*

The link analysis in figure 3 is established to analyze the relationship between 'the intention not to reuse and to recommend,' and 'dissatisfaction and negative sentiments' (refer to figure 3).

The case similarity analysis in table 3 reviews the likeliness between the 19 cases in accordance with code co-occurrence between the cases selected in terms of complaints (refer to table 2).

| Node | Group 1 | Group 2 | Similarity |
|------|---------|---------|------------|
| 1    | C9      | C12     | 0,857      |
| 2    | C15     | C17     | 0,833      |
| 3    | C2      | C3      | 0,829      |
| 4    | C5      | C14     | 0,816      |
| 5    | Node 2  | C18     | 0,811      |
| 6    | C8      | Node 1  | 0,779      |
| 7    | C10     | C16     | 0,767      |
| 8    | Node 4  | Node 6  | 0,764      |
| 9    | Node 3  | C6      | 0,749      |
| 10   | Node 7  | C13     | 0,747      |
| 11   | C7      | Node 5  | 0,739      |
| 12   | C11     | C19     | 0,730      |
| 13   | Node 8  | Node 10 | 0,727      |
| 14   | Node 9  | Node 11 | 0,725      |
| 15   | Node 14 | Node 12 | 0,704      |
| 16   | Node 15 | Node 13 | 0,690      |
| 17   | C1      | C4      | 0,672      |
| 18   | Node 17 | Node 16 | 0,622      |

Table 3. *Case similarity (Cosine Theta/ frequency)*

The similarity index (refer to table 3) confirms that most of the cases show a high percentage of likeness tending to 0.8 (almost complete similarity in code co-occurrence). There are 18 nodes; the least similar has a likeness index of 0.622. The main dissimilarities, related to the cases C1, C4, and C19, are simply explained by the low numbers of reviews sampled, three of which accounts 11.

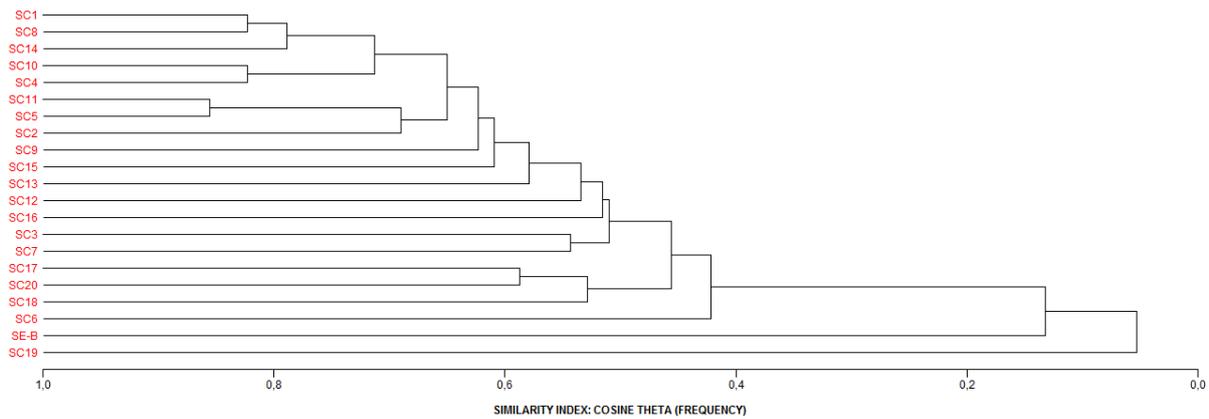

Figure 3. *Similarity index - codes (Cosine Theta/ frequency)*

Besides, the dendrogram of codes' similarities, using cos theta (refer to figure 3) shows clearly the high similarity index tending to 1 between the groups of codes 'SC1, SC8, and SC14' – 'the rooms, and the wellness and comfort related complaints'; 'SC4 and SC10' – 'food and beverage, and amenities related complaints'. This suggests that customers allocate significant importance to comfort in rooms as for high-end hotels. The main last similarity appears in the coupled codes 'SC5, SC11' – 'staff, and front office related complaints.' Therefore most of the complaints on staff are those on the front office services.

In addition, according to the codes link analysis, the least similar assigned codes to the others in terms of co-occurrence, are SC6, SC17, SC18, SC19, and SC20, leading to assert that the sampled upscale hotels have little complaints in terms of decoration, signage, location, overall quality, and customer value.

*Link analysis disloyalty - complaints*

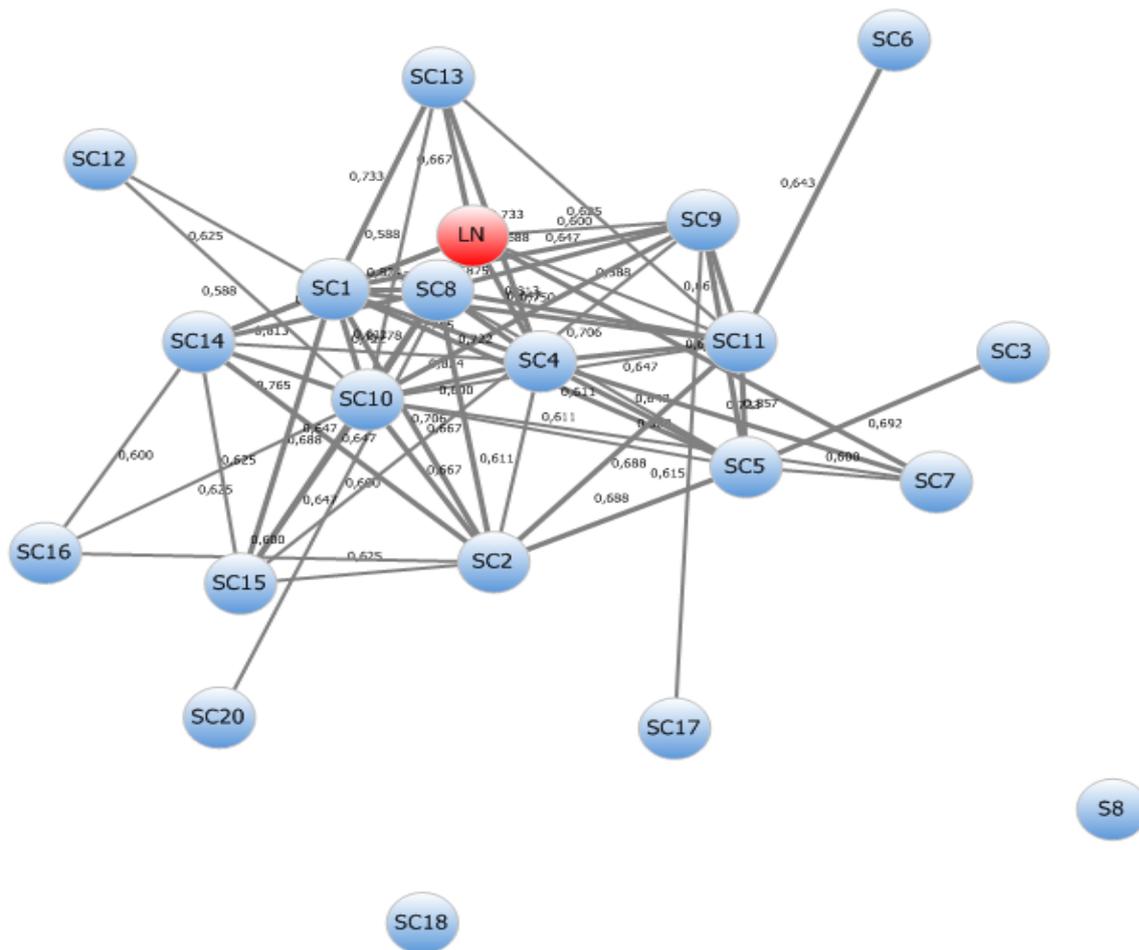

Figure 4. *Link analysis disloyalty - complaints*

The link analysis in figure 4, established to analyze the relationship between the 'future intention to be disloyal' and 'complaints and negative sentiments.'

A total of 21 nodes are identified with different levels of similarity. The first level of importance encompasses the 4 first nodes, with similarity values  $\geq 0.813$ , and includes SC8 (price-related complaints), SC11 (front office-related complaints), SC5 (staff related complaints), SC10 (amenities-related complaints), SC4 (food and beverage-related complaints) and SC14 (wellness and comfort-related complaints). The previously mentioned codes are found to be significant vectors influencing customers' negative future decisions to re-book. Thus, there is a strong relationship between disloyalty and high prices.

In addition, the least impacting attributes to disloyalty are mainly the triad of 'location,' 'technology,' and signage-related complaints.' This result regarding upscale hotels in Seoul is primarily due to the few claims made on those matters.

## CONCLUSIONS, LIMITATIONS AND FUTURE RESEARCH

Several articles have been published analyzing online reviews of hotels, most of which focused on loyalty and factors behind the latter. This study is different regarding several issues. It studied the key complaints of customers, post visits in upscale hotels in a substantially urbanized city. Besides, it applied an in-depth text analysis of online reviews to study the link between the attributes thereof and existent customers' willingness not to recommend and not to reuse the actual hotels. The study concludes that disloyal customers are price-sensitive. The conclusion is partly aligned to the finding of Jani and Han (2014), in the way they assert the importance of comfort and excellency of services for customers. However, it is different on the side that the latter scholars confirm that high-end hotels' users are price-sensitive.

In addition, the main attributes impacting on customers' negative decisions to reuse or recommend hotels are staff attitudes and professionalism towards customers as well as comfortable accommodation.

## CONCEPTS OF BIOECONOMY. ENVIRONMENTAL, ECONOMIC AND TECHNOLOGICAL APPROACHES

**Trigkas, Marios; Karagouni, Glykeria; Nikolaidis, Konstantinos; Papadopoulos, Ioannis**

University of Thessaly, Department of Forestry, Wood Sciences & Design, Laboratory of Economics, Marketing and Entrepreneurship – Karditsa Greece

### ABSTRACT

Bioeconomy uses new knowledge and innovation to produce a wide range of biobased products and energy, including also waste utilization. This is the reason that is considered as a basic component of sustainable development. Thus, while bioeconomy lies to science and technology, its perspective and impact may have quite wider results. The main approaches are ecological or technological oriented, while some others focus to the development of the bioeconomy market. The aim of the present paper is to shed some light on the emerging concept of bioeconomy, focusing to the Greek economic and production reality and to set the foundations for the shaping and determination of the meaning, using environmental, economic, scientific and technological approaches from specialized surveyed key-stakeholders. The research adds to the relative contemporary existing literature on the issue. Thus, it is anticipated to contribute to the clearing of the foggy landscape regarding the way we can define bioeconomy and how the concept could be evolved to a new scientific – research area. Furthermore, the research can be the catalyst for the formation of a concrete basis for the development of a national bioeconomy strategy in Greece and the development of supporting policies.

This paper will present the theoretical background, the research questions and the research methodology of the investigation. The primary research was conducted in Greece in 2020.

*Keywords: Bioeconomy, concept, bioeconomy strategies, sustainable development, biobased products, approaches, sustainable economic models*

### INTRODUCTION

According to the European Union's (EU) definition "bioeconomy comprises those parts of the economy that use renewable biological resources from land and sea – such as crops, forests, fish, animals and micro-organisms – to produce food, materials and energy (European Commission, 2012). The goal is a more innovative and a low-emissions economy, reconciling demands for sustainable agriculture and fisheries, food security, and the sustainable use of renewable biological resources for

industrial purposes, while ensuring biodiversity and environmental protection (European Commission 2012; 2017). More specifically, bioeconomy includes agriculture, forestry, fisheries and food industries along with traditional industries dealing with biomass utilization such as the paper industry, as long as parts of the chemical, biotechnology and energy industries. (European Commission, 2012; Knudsen et al., 2015).

Although the term of bioeconomy was initially introduced by scientists dealing with the industrial impacts of the evolutions in biology, the main reason for which bioeconomy became a “mainstream” policy idea in Europe, was the initiative of several executives of the European Commission to further promote the concept of bioeconomy (Knudsen et al., 2015; Bugge et al., 2016). Initially, two major dimensions were highlighted; the perspective for innovations through biotechnology and the perspective for substituting nonrenewable resources focusing to the use of biomass for the production of fuels, energy, chemicals and other biobased products (E.U., 2007).

Nowadays, bioeconomy uses new knowledge and innovation to produce a wide range of biobased products and energy, including also waste utilization (Bugge et al., 2016; Trigkas et al., 2020). This is the reason that is considered as a basic component of sustainable development (Zilberman et al., 2018). However, this fact does not automatically conclude that, for the sum of the value chains under the bioeconomy concept their sustainability is definite. The change in the contemporary approach of the bioeconomy has to do with the aim of achieving bigger efficiency in use of resources and biomass, maximizing the added value of the produced goods. That’s the contemporary meaning of the circular bioeconomy (Global Bioeconomy Summit, 2015; Adamovicz, 2017; Karagouni, 2018).

Additionally, EU through its bioeconomy strategy wishes to become the “headliner” that will lead global economy towards a sustainable model where the resources consumption for the production of goods and energy will not have non-reversible impacts. The EU bioeconomy strategy launched in 2012, aims to food safety, sustainable management of natural resources, the gradual disengagement of nonrenewable natural resources, the slowing of climate change and finally the enhancement of competitiveness and job creation (European Commission, 2017). However, this particular strategy has been under criticism by those who believe that is focused too much to the market and technological development (Bugge et al., 2016). Thus, while bioeconomy lies to science and technology, its perspective and impact may have quite wider results. In fact, bioeconomy is about a social transformation procedure, very dynamic and extremely complicated, aiming to the gradual shifting for a fossil-based economy to a sustainable biobased economy (Aguilar et al., 2018). Speeding up the growth of the bioeconomy concept, could result to significant social changes among the EU member states, since new opportunities for innovations emerge and new jobs are created, helping to the reformation of Europe towards a limited environmental footprint. Furthermore, it gives the

opportunity to rural and isolated areas for economic growth, creating new value chains in primary production and manufacturing (Trigkas et al., 2020)

Finally, its importance in policies globally, is recognized since, more than 40 countries internationally have incorporated the bioeconomy concept into their political agenda (Schütte, 2018), indicating that policies around the world are focusing to a sustainable biobased economy, with efficient use of resources, showing a transformational shift from practices of the past (Trigkas et al., 2020).

The aim of the present paper is to shed some light on the emerging concept of bioeconomy, focusing to the Greek economic and production reality and to set the foundations for the shaping and determination of the meaning, using environmental, economic, scientific and technological approaches from specialized surveyed key-stakeholders. Thus, we believe our research will set the direction for introducing and developing a bioeconomy strategy in the country, as part of other related policies and strategies such as the Greek National Circular Economy strategy, the National renewable energy action plan, or the Forest management strategy.

## LITERATURE REVIEW

It is quite evident that, technological evolution has helped the nations around the world to build a production model based on the exploitation of fossil fuels and materials, leading to an impressive economic and social welfare. However, we are urged to pay a high price for this progress as it is proved by the current major challenges of the 21<sup>st</sup> century, such as social inequality, climate change and scarcity of natural resources. (Alcamo et al., 2007; Tracy and Anne, 2008; Bauer et al., 2012; Faivre et al., 2017; Schütte, 2018). Especially for the Mediterranean region, studies predict that the climate change impacts, such as soils erosion and loss of agricultural land, food scarcity, temperature increase, loss of biodiversity and forest areas etc. will be more intense than other regions of the world (Brassioulis, 2011; Marquina, 2012; Alcon et al., 2020). Thus, the growth of the bioeconomy is emerging as an imperative and key-policy idea for the confrontation of the above-mentioned problems, contributing simultaneously to economic growth and social cohesion. Furthermore, an orthologous implementation of the bioeconomy model could significantly contribute towards the achievement of the sustainable development targets for 2030 (European Commission, 2012; European Commission, 2017; McCormick and Kautto, 2013; D'Amato et al., 2017).

This environmental part of the bioeconomy concept, based further to knowledge and innovation for the utilization of natural resources, seems to be able to propose solutions for the transition to a sustainable future (Kitchen and Marsden, 2011; Kleinschmit et al., 2017; Ramcilovic-Suominen and Pülzl, 2018; Lainez et al., 2018; Ghani et al., 2019). Sophisticated emerging technologies and innovations in forest and agricultural biomass utilization, water resources management and

aquaculture, biotechnology, in biofuels and bioenergy production and in biobased products development, can act as viable alternative solutions to the existing production models. The sustainability of these technologies and approaches can be further improved in combination with supplementary models of circular economy and green economy (D'Amato et al., 2017; Merli et al., 2018; Ferreira et al., 2018; Trigkas et al., 2020). This final approach has led the discussion to the further expansion of the concept, towards circular bioeconomy (Carrus and Damer, 2018; Karagouni, 2018).

Additionally, the cross-sectoral and interdisciplinary character of the bioeconomy leads to corresponding approaches and initiatives aiming to address environmental and socioeconomic challenges (Bran and Dobre, 2017), while the role of specific sciences as the biology, biotechnology, environmental and engineering sciences, economics and information technology sciences, are mentioned in the literature as the main disciplines that formulate the concept of the bioeconomy (Bugge et al., 2016). Supplementary, the further capabilities for the development of the bioeconomy are mirrored by the increasing demand and the rapid development for biobased products and markets respectively (Langeveld et al., 2010; Dammer and Carus, 2013; Peuckert and Quitzow, 2017; Falcone and Imbert, 2018). New opportunities for business ventures, creation of supply chains and markets for the biomass and biobased products, energy and related services, are emerging globally. However, this transformation of the economic model and market is not easy to become a new reality, because of the resistance and the status of the fossil-based industries in the global economy (Trigkas et al., 2020). Hence, the transition to the bioeconomy model is a matter that requires policy will and dynamic initiatives (Arundel and Sawaya, 2009; Staffas et al., 2013; El-Chichakli et al., 2016; ). According to Bünger (2010), more than 90% of oil-based products could be substituted by alternative biobased solutions, while predictions for the future show that till 2030 the one third of chemicals and materials and a 50% of the pharmaceutical market could be of biological basis (Bünger, 2010).

A basic element of the above transition is the strong support of research and innovation in combination with consumers behavior and understanding the existing fossil-based products, do not incorporate into their purchase value the total environmental cost. As mentioned, the introduction of policies for innovation, should be accompanied by motives for further expansion of the knowledge basis for new bio-based technologies and products. Simultaneously, the creation of synergies in a cross-sectoral and scientific level (e.g. agriculture, forestry, aquaculture, food production, chemicals, energy, biotechnology etc.), could offer integrated solutions for the global challenges. The implementation of contemporary methods for supporting skills and capabilities development among the policy makers, are considered to be key elements for the foundation of the bioeconomy pillars (Hakovirta and Lucia, 2019; Urmetzer et al., 2020). Additionally, most countries measure the contribution of bioeconomy in terms of added value and jobs creation, with the most of them to

evaluate in a restricted way this contribution in environmental and social terms (Bracco et al., 2018). This contribution measurement is becoming further difficult to be estimated, because of the fact of the cross-sectoral nature of the bioeconomy, or because of the lack of credible statistical data (Jander et al., 2020). The aim for monitoring the contribution of the bioeconomy into a country's economy, is not only to highlight its volume in economic terms but also to understand the full scale of potential direct and indirect benefits for a country (Linser and Lier, 2020) and to finally act as presuppose for introduction of integrated policies, governance and strategies for the bioeconomy at national and international level (Staffas et al., 2013; De Besi and McCormick, 2015).

Elements for the development of related strategies among countries, are considered to be the different characteristics of each country (e.g. economic, production models, technology levels, availability of resources, knowledge basis etc.), and the understanding of the interactions and intercorrelations among these factors (De Besi and McCormick, 2015; Indzere, 2019). Worldwide, a number of countries and international organizations have already developed dedicated bioeconomy strategies, such as the European Union (EU), the Organization for Economic Co-operation and Development (OECD), Australia, Finland, France, Germany, Japan, Malaysia, South Africa, Spain, Sweden, and the United States (Dieckhoff et al., 2015). In other countries, strategies are currently under development. Besides international and national activities, a number of regional bioeconomy initiatives and innovation networks have been established (Dieckhoff et al., 2015). According to a recent research of Papadopoulou et al. (2018), for Greece only two clusters/think tanks for the bioeconomy were recognized (the Greek Bioeconomy Forum and the cluster of Bioenergy and the Environment of Western Macedonia). Despite some differences, all official strategies envision a technology-based transition to the bioeconomy (Laibach et al., 2019; Priefer and Meyer, 2019). In criticism of this understanding, an alternative vision of the bioeconomy has been developed in the scientific and societal debate, focusing on socio-ecological aspects and alternatives. According to Priefer and Meyer (2019) the technology and environmental oriented implementation pathways for the bioeconomy are considered to be combinable, while, in the scientific and societal debates, these are seen as contradictory. Differences in visioning and planning for the bioeconomy, finally shape different strategies for the bioeconomy. While a country does not have an integrated approach, it tends to adopt a fragment approach. There is evidence that there are significant opportunities in Greece for the development of a wealthy and lucrative economy, based on renewable resources, environmental friendly technologies and innovations (Trigkas et al., 2016). However, effective growth of bioeconomy in Greece depends on successful cooperation of all stakeholders (state, business, citizens) (Trigkas et al., 2018).

The research questions that this paper tries to give concrete answers are:

Q1: Which are the main approaches that Greek key-stakeholders follow to shape the concept of bioeconomy?

Q2: Which one of these emerging approaches is prevailing

Q3: Are these approaches in line with the EU strategy for the bioeconomy?

Q4: How can these approaches become the foundations of a Greek national strategy for the bioeconomy?

We argue that our research contributes to the existing debate on the buzzing and emerging concept of the bioeconomy internationally and fills a scientific gap at regional level of a typical Mediterranean economy, enriching related literature.

## RESEARCH DESIGN AND METHODOLOGY

The primary research for this exploratory study focuses on Greek bioeconomy key-stakeholders such as environmental, economic and technological universities and research organizations, business associations and public authorities such as ministries dealing with natural environment. For the purposes of the survey, we used as our primary research tool a structured questionnaire, specially designed to approach and derive the structural components of the complex and buzzing bioeconomy concept, according to related literature and previous research on the issue. a broad understanding of the investigated issues. The data was collected by using the Google Forms app. The survey period was between March – July of 2020 and final 78 questionnaires were collected, while 71 were under evaluation, since 7 of them were not sufficiently completed and were excluded from our analysis. Our sample was 250 organizations belonging to the above categories of stakeholders. That results to a respond rate of 30%. Most of our sample, 230 – 92% were university departments.

Our questionnaire items were developed using a five-point Liker scales. The development of scales was based on empirical and theoretical contributions from bioeconomy scholars in Greece (Karagouni, 2018; Papadopoulou et al., 2018; Trigkas 2020) and after the relevant literature review.

The final questionnaire consisted of 17 questions grouped into 6 main categories. The first group included 3 questions about the knowledge of the bioeconomy, the 2<sup>nd</sup> group deals with the scientific approach of the concept including two questions of 20 items, the 3<sup>rd</sup> group was focusing to the technological approach (2 questions of 23 items), the 4<sup>th</sup> group to the environmental approach including 1 question with 15 items, the 5<sup>th</sup> group to the economic approach with 3 questions of 43 items, while the final group of questions was dealing with the profile of the surveyed organization.

In the preliminary stage of the study, the questionnaire was pre-tested on 5 related organizations. The questionnaire's pre-testing led to changes in the questionnaire, such as regrouping and reformulating

some questions, in order to reduce the size of the questionnaire, since the majority of the respondents appreciated the difficulty and the time length to complete the questionnaire a little complex.

The data will be recorded, processed and analyzed using the IBM SPSS Statistics 25 special statistical program, as well as the relevant frequency checks (Frequencies), descriptive statistics and correlations (Norusis, 2007).

## CONCLUSIONS

The confrontation of the urgent environmental, economic and social challenges global, presupposes the undertaking of drastic and dynamic initiatives and measures, with the alteration of the existing economic and production model, to be recognized as the most important. More specifically, the transition from a fossil-based economy towards a more biobased and sustainable economy, constitutes one of the prevailing solutions globally. However the concept of the bioeconomy, since it still stands as an emerging meaning for most of the countries – for Greece too – has become the field of different and sometimes contradictorily approaches by the stakeholders, depending each time on the specific characteristics that each part is incorporating. Furthermore, according to international bibliography, bioeconomy constitutes an interdisciplinary and cross-sectoral concept thus its complexity and its different point of approach to be magnified. Hence, we either see to prevail the ecological approach either the technological or the socioeconomic approach. Our initial findings are compatible with these conclusions of the related literature on the issue; however, differences emerge for the Greek reality which are further specialized to more detailed determinants of the bioeconomy concept. These different approaches on their point of view, can lead to the development of different strategies for the bioeconomy, depending to which one is prevailing each time.

Our research contributes to this debate and draws up the concept and the content of bioeconomy, through the opinions of specialized groups of stakeholders in Greece, which is expected to contribute – if not already have actively engaged so – to the shaping of the framework for the development of bioeconomy at national level. We argue that our research gives valuable input to the existing literature in order to be able to formulate a more concrete and clear definition of the bioeconomy concept, highlighting practical and managerial issues for its implementation as well, helping policy makers to develop and adopt an integrated strategy for bioeconomy. We also investigate at which level the opinions of bioeconomy experts in Greece are close to the existing EU strategy for bioeconomy and how a potential Greek strategy could be adapted to the main pillars and directions of the EU strategy.

Additionally, according to the approach that is investigating, the research presents practical implications of bioeconomy pathways which have to do with ways of biomass exploitation, improvement of biomass supply chain, characteristics and environmental performance of biobased

products, creation of new value chains and business ventures for bioeconomy, consequences on business operations and profitability, consumers behavior for biobased products as long as for the boosting of knowledge basis on the bioeconomy concept. Finally, as it was stated, these approaches can be framed from the adoption of a concrete basis for the development of a national bioeconomy strategy for Greece and the development of supporting policies.

The research adds to the relative contemporary existing literature on the issue and in a stronger manner the rather limited literature and research at Greek level. Thus, it is anticipated to contribute to the clearing of the foggy landscape regarding the way we can define bioeconomy and how the concept could be evolved to a new scientific – research area including specific principles and implementation methodologies. The nature of the research to address to research - academic and public mainly organizations, which may constitute the catalysts for the further diffusion and framing of the concept, supports our above conclusion.

Further future research is proposed to be implemented at international – European level and at consumers behavior level, in order to establish an integrated approach to the concept of bioeconomy which could shape the conditions for the final transition towards this model for the confrontation of global challenges.

## ABSTRACT

Despite nowadays we finally perceive Sustainable Development – and inherently sustainable agriculture, as an essentiality to be achieved on a global level, there are still several concerns and limitations associated to our sustainability-oriented knowledge gap and prevailing assessment tools. It is also recognized that in order to truly understand the absolute meaning of sustainability and improve its appraisal we must review current practices regarding its assessment. Thus, this study aims to enlighten foremost, understandings and major traits of 105 distinguished assessment tools developed worldwide by a multitude of sectors. For such we conducted a structured literature review to comprehend major limitations and gaps regarding sustainability assessment among agricultural practices, followed by a categorization analysis. Results confirmed that, despite a considerable variety of instruments presented in literature as sustainability assessment tools, the majority continue to focus on particular affairs such as the environmental domain and farm-level evaluations. Additionally, by considering sustainability a dynamic and context-specific concept, it was concluded that one of the main reasons for research of this nature being frequently tagged as inadequate, could be advocated also by the fact that a considerable amount of sustainability assessment tools were developed to assess arable farming or simply labeled as universal tools. Finally, this work contribute to engage businesses managers and stakeholders to embrace the importance and weight of social and economic pillars when aiming for a complete and holistic assessment of their businesses sustainability level.

*Keywords: Sustainable development; Sustainability assessment tools; TBL; Sustainability evaluation; Categorization analysis.*

## INTRODUCTION

It is well known that agricultural production contributes significantly to contemporary concerns - such as climate change, water pollution and loss of biodiversity, while being also responsible for the

incremental consumption of limited natural resources (Olde *et al.*, 2016; Hayati, 2017). Nevertheless, other activities related to agriculture are also substantially responsible for social and economic affairs. This tie is related to such activities' intrinsic impacts over human wellbeing, territorial development and business growth. It is in this remark that today we finally perceive sustainable agriculture as a vital requisite to achieve Sustainable Development (SD) on a global level - justifying why the pursuit for sustainability had a strong stimulus in this field (Hayati, 2017).

Also, the source of this emergent global sense of responsiveness and awareness on how susceptible ecological ecosystems truly are to certain human activities, was mostly caused from the acknowledgement of natural resources depletion, apace with projections of an irrepressible population growth. In reality, such led to both concepts of food security and sustainable agriculture to become the most spoken topics of this millennium (Dantsis *et al.*, 2010; Kirchmann *et al.*, 2016; Hayati, 2017; Schrama *et al.*, 2018; Herath and Rathnayake, 2019; Independent Group of Scientists appointed by the Secretary-General, 2019). However, this is not by far a contemporary topic. It is defended that the idea was coined by the end of the XVIII century, despite academia solely started to show interest over environmental impacts around the 1960s, being later on followed by institutional organizations around the 80s (Hayati, 2017; Iyer and Reczek, 2017; Herath and Rathnayake, 2019).

In regard the first assessment tools being developed, it was reported by Rosnoblet, Girardin, Weinzaepflen, & Bockstaller (2006) how these tended to share a strong emphasis on environmental impacts until late 90s - over neglecting all other fundamental categories such as social, economic, institutional, political and ethical. Nevertheless, according to other specialists, such alternative components continue until today to remain under-represented among sustainability appraisals (Olde *et al.*, 2016; Hayati, 2017). Beyond this recurrent claim that most of the measurements conducted so far tend to focus predominantly either on environmental concerns or specifically on assessing certain impact categories – such as Greenhouse Gas (GHG), Carbon footprint or Water footprint (Rosnoblet *et al.*, 2006; United Nations, 2007; Bockstaller *et al.*, 2008; Binder, Feola and Steinberger, 2010; Thiollet-scholtus and Bockstaller, 2015), another shortcoming pointed out among literature is in regard the grand majority of tools, besides being context-specific, have been expressly developed to assess arable crops or livestock production (Thiollet-scholtus and Bockstaller, 2015; Hayati, 2017). In line with that assumption, it is commonly remarked a considerable shortage among the scientific body of proper and suitable general assessment frameworks designed specifically to evaluate other crops, such as permanent crops (Christ and Burritt, 2013; Thiollet-scholtus and Bockstaller, 2015; Flores, 2018).

The bottom line here is that, despite today we finally perceive Sustainable Development (SD) – and subsequently Sustainable Agriculture, as an essentiality to be achieved on a global level (Hayati, 2017), there is still a clear reluctance regarding such transition. According to literature, the fateful hamper is

the fact that despite a much debated concept with a wide range of implications, to date there is not a widely accepted definition for Sustainability concept (Christ and Burritt, 2013; Santiago-Brown *et al.*, 2014, 2015; Thiollet-scholtus and Bockstaller, 2015; Velten *et al.*, 2015; Hayati, 2017; Keichinger and Thiollet-Scholtus, 2017; Martins *et al.*, 2018; Merli, Preziosi and Acampora, 2018; Pomarici and Vecchio, 2019). From Our Common Future report published in 1987 by the Brundtland Commission, to the most recent 2030 Agenda for Sustainable Development goals (SDGs) relaunched by the United Nations, the perception of what to be sustainable really means have gradually evolved over the years (Hayati, 2017; Herath and Rathnayake, 2019; Ramos, 2019). Even today a multitude of distinct Sustainability definitions can be found among specialized literature (Goldman, 1995; Hansen, 1996; Velten *et al.*, 2015; Hayati, 2017). This ambiguity and blurred web of meanings is consequently pointed as the cause for the development of inadequate sustainability assessment research - characterized by biased design, erroneous interpretations, flawed conclusions, and serious incompatibility issues due to data comparison difficulties (Gafsi and Favreau, 2013; Santiago-Brown *et al.*, 2014; Iyer and Reczek, 2017; Martins *et al.*, 2018). As an attempt to overcome such conceptual vagueness and diverseness, Sustainability per se is mostly perceived today in a Triple Bottom Line (TBL) perspective (Hayati, 2017). The TBL theory, created by Elkington (1994) defends that People, Planet and Profit are imperative Sustainability principles, promoting the idea that a sustainable development occurs when organizations show responsibility toward environmental health, social equity and economic viability (Renton, Manktelow and Kingston, 2002; Santiago-Brown *et al.*, 2014; Graça *et al.*, 2017; Hayati, 2017; Iyer and Reczek, 2017).

In summary, even though this search for sustainable development and sustainable agriculture has been in the spotlight for the last generations, today there are still several concerns and limitations pointed out among specialists in regard to our sustainability-oriented knowledge gap and prevailing assessment tools. A formal effort is therefore still necessary to consistently express the theories and frameworks developed in sustainability science and within other disciplines that represent the body of accumulated knowledge, as well as integrated methodologies. Aligned to that, it is also assumed that to truly understand and improve our sustainability-oriented knowledge, we must not only comprehend and identify sustainability definitions and principles, but also review current practices regarding its assessment (Flores, 2018). Beyond that, the fact that sustainability is also considered a time-specific and location-specific concept, imply that any assessment tool must be linked to the context in which the process does operate (Hayati, 2017). Thus, from recognizing assessment indicators and frameworks as a powerful performance evaluation tool (Ramos, 2019), this study aims to enlighten foremost, understandings and commonalities over such methodologies. It is our belief that this work will serve as a primary source of elucidation and guidance for those researchers and policy makers who aim to make

sustainability more measurable and less ambiguous. The key research question is: given the plethora of sustainability assessment tools, what are the main common grounds and differences between them? And, how difficult it is to find proper methods capable to evaluate accurately and holistically how sustainable a certain good or activity really is? In regard to such, despite the ideology of sustainable development is being pursued worldwide by governments, decision makers and society in general from different fields, it is with general consensus the inherent relevance of agribusinesses in that path towards sustainability. For that matter, our study was initially focused in that sector, even though there is a clear influence and participation of other industries. Thus, this work conducted a critical review to provide a structured search in the body of literature, within the goal to identify and develop a categorization analysis on major sustainability assessment tools. This study aims to collect evidences over the most distinguished and available sustainability assessment tools developed until this present, and our higher purpose was also to develop a guiding work capable to support further research over assessment tools and sustainability evaluations. Despite the existence of several articles reviewing and analyzing assessment instruments, these are generally presented as too narrow and too conceptual – mostly for focusing on a single sustainability domain, on a particular environmental impact, or solely on a few spotted tools (Van Der Werf and Petit, 2002; Rosnoblet *et al.*, 2006; Ferrara and De Feo, 2018). In this sense, a structured analysis over current sustainability assessment tools developed worldwide by a multitude of sectors is here presented, where common grounds were summarized in order to compare and analyze all identified instruments. This approach is seen as appropriate to guide decision makers into micro-level performance evaluations. The rest of this paper is organized as follows: the next section presents a brief literature review on sustainability assessment, where the effectiveness of assessment tools is also discussed. Afterwards we describe the methodology used, followed by the results and discussion, and finally the conclusion.

## **BACKGROUND OF THE STUDY: SUSTAINABILITY ASSESSMENT**

Specialists finally recognize that it is when attempting to thrive between all Sustainability components, that the evaluation methodology being used can play a key role (Marta-Costa and Silva, 2013b; Kirchmann *et al.*, 2016; Schrama *et al.*, 2018). Assessment tools are therefore nowadays, not only seen as a vital instrument and a powerful aid to support the transition towards sustainability, but their capacity to guide and support whole countries to take informed decisions has also been well established (Ramos, 2019). However, despite the process of designing systems from sustainable principles became a leading objective among scientific research and policy agendas, the reality is that the assessment of their performance and impacts still remains controversy and critical until this present. A pointed reason is the appearance of many modelling approaches with a wide variety of tools generated to evaluate

sustainability. Such panoply of frameworks and indicators from different fields is related to the fact that a widely accepted methodology for the creation of a scientifically substantiated system of measurements hasn't yet been developed (Dantsis *et al.*, 2010; Koochafkan, Altieri and Gimenez, 2011). Another defended motive is the accession of multidisciplinary and cooperation initiatives (Abdul Murad *et al.*, 2019). The aim of this section is to present an overview over sustainability tools heterogeneity, along with a discussion regarding assessment methods' limitations and ways to evaluate their accuracy and functionality.

Even though sustainability assessment tools are generally characterized accordingly to their scope, content and structure, such instruments can vary widely in different aspects – from geographical coverage, to data collection, data analysis, scale and levels, assessment methodology, stated purpose, final goals, sectoral comprehensiveness, target groups, typology of indicators, suitable data, applicability, analysis, the degree of stakeholder participation, resources needed, costs, purpose, and the time required for its implementation (Dantsis *et al.*, 2010; Olde *et al.*, 2016; Hayati, 2017). For that matter - and usually in consonance with each author's interpretation of the concept, sustainability assessment tools tend to be categorized into different models or families (Flores, 2018). As an example, we can find among literature different categorization tool groups regarding: i) major goals and principles - from an ideological approach, to a system-oriented concept (Marta-Costa & Silva, 2013a); ii) implementation approach – such as the basic top-down and bottom-up approach (Binder, Feola and Steinberger, 2010; Abdul Murad *et al.*, 2019); iii) scale and levels of assessment – from the farm gate, to regional, national and in some cases even at the global level (Dantsis *et al.*, 2010); iv) assessment typology – from sustainability indicators, to sustainability indexes, reference systems, frameworks, Eco points, linear programming models, and trade-off models of production alternatives (López-Ridaura, Masera and Astier, 2002; Binder, Feola and Steinberger, 2010; Van Passel and Meul, 2012; Hayati, 2017). However, it should be bared in mind that there are several more other approaches and categories outside the ones just mentioned here.

An important decision factor when selecting the most appropriate assessment tools, is based on the scale and levels of assessment. Scale concept refers to the spatial, temporal, quantitative or analytical dimensions used by scientists to measure and analyze objects and processes, while levels on the other hand refer to locations in that scale (Van Passel and Meul, 2012). Different scales can therefore measure different levels. In spite any scale of assessment is relevant to sustainability outcomes at some extent, it should be acknowledged that fewer data starts being available from regional, to higher scales. As mentioned by Hayati (2017), as we move to higher levels of the hierarchy – such as regional, national and global levels, it becomes increasingly difficult to weigh up and trade off in any meaningful way. That is why assessments at farm-level continues until today to be the most studied one, followed by the

regional and national scales – although to a much lesser degree (Rosnoblet *et al.*, 2006). Thus, the complexity and the scale of the system we are assessing, are indeed a crucial point in regard the assessment tool to be chosen due to the panoply of different assessment instruments possible to find. Regarding different typologies, as simple arrangements we can identify groups of monetary tools – such as the Cost Benefit Analysis, the Index of Sustainable Economic Welfare and the Genuine Savings; or groups of biophysical models – such as emergy analysis or exergy, and the ecological footprint (Van Passel and Meul, 2012; Hayati, 2017). In the case of Sustainability Indicators, these can go from simple and isolated, to indicators set or even composite indicators. These last are capable to aggregate in one numerical value relevant information from various indicators in order to evaluate the system's sustainability level into a single Sustainability Index (López-Ridaura, Masera and Astier, 2002; Marta-Costa and Silva, 2013a). As for more complex levels, we have Reference Systems - which are mostly used when assessing ecological sustainability in an ecosystem perspective (López-Ridaura, Masera and Astier, 2002; Marta-Costa and Silva, 2013a), or Sustainability Assessment Frameworks. According to Marta-Costa and Silva (2013a) these frameworks' conceptual and practical efforts tend to be qualitatively differentiated from the other groups as they have a more complex and rigorous structure. Sustainability Indicators have become a widespread type of tool to evaluate sustainability and are considered selected parameters that illustrate conditions of the analyzed systems (Bélanger *et al.*, 2015). Regardless the notorious abundance and diversification of available instruments for sustainability evaluation, indicators-based assessments have been until recent times the most widely used platform since the Sustainability Indicators Phenomenon in the 1990's – translated into an explosion of sustainability indicators among the scientific body and published literature (Rosnoblet *et al.*, 2006; Christ and Burritt, 2013; Olde *et al.*, 2016; Hayati, 2017; Abdul Murad *et al.*, 2019; Ramos, 2019). Sustainability Indicators have also been recognized as a tool that reduces the descriptions and integrates information from complex systems (Parent *et al.*, 2013). These are for that matter described as capable to reflect complex and difficult-to-access information of a particular system – while able to also provide models and simulations that often can have a predictive function (Bockstaller *et al.*, 2008). The complexity of an indicator-based tool can vary on practical affairs such as: i) are assessments to be treated individually; ii) as part of a weighted set; or iii) combined into a composite index (Hayati, 2017). In regard Single Indicator Assessments – even though being often criticized for generally presenting a low quality of prediction, these continue to be the most commonly used method when evaluating a specific practice (Hayati, 2017). However, it has been suggested that single indicators should be combined in order to improve the assessment accuracy (Bockstaller *et al.*, 2008). Composite indicators, according to Rosnoblet *et al.* (2006), are already being contemplated by almost one third of the methods developed, and in such cases indicators' results tend to be presented in an aggregated way - generally

with a simple sum or mean of values. On the opposite side, other authors defend that not only the use of multiple indicators can be confusing in practice, but there is also a clear knowledge-gap regarding efficient integration methods or aggregation procedures when dealing with various factors (Bockstaller *et al.*, 2008).

In regard the structural frameworks to assess sustainability, these are categorized on systematic approaches and disciplinary contents. Assessment Frameworks were considered relevant to explore, once despite a clear proliferation of the previously mentioned sets of sustainable agriculture indicators, the challenge on selecting and designing proper assessments led to the development of necessary structural approaches. The intention for creating such guidelines was that these approaches were capable to guide the entire process of assessing sustainability (United Nations, 2007; Cândido *et al.*, 2015). There are 5 official conceptual frameworks: i) the Driving Force-State-Response frameworks (DSR) - originally named Pressure-State-Response Model (PSR); ii) the Issue-based or Theme-based Frameworks; iii) Capital Frameworks; iv) Accounting Frameworks; and finally v) Aggregated Indicators. As mentioned before, despite all the inherent challenges related to the aggregation process, this type of conceptual framework continue to be acclaimed due to their capacity to simplify and quantify complex systems, while facilitating communication. However, when proceeding to a cross-country comparison, existing conflicts among indicators' ratings become clear - stressing incompatibility issues, inconsistencies in statistical databases and difficulties for data comparison between countries with different development levels (Sopilko *et al.*, 2019).

Despite according to literature, when choosing a specific assessment tool to measure sustainability in a particular moment, its effectiveness generally depends on factors such as available data, time, and budgetary constraints (Hayati, 2017), today it is also accepted that in order to evaluate complex systems, assessment tools must also be capable of translating dynamic natures (Binder, Feola and Steinberger, 2010). Aligned to that, one of the key elements to successfully assess sustainability is that of defining and properly select effective indicators - indicators globally applicable, cost-effective, comprehensive, realistic and comparable (Hayati, 2017). Notwithstanding, to be able to find such distinct characteristics seems to be one of the big challenges.

To finalize this section, the point at issue is the fact that, despite all the potentialities of available tools being used nowadays to assess sustainability, the majority is still tagged by considerable disadvantages or limitations (Dantsis *et al.*, 2010). A critical downside is when the central idea of sustainability - due to its ambiguousness and vagueness, is not adequately addressed by the selected assessment criteria and gives room for biased approaches or erroneous results' interpretations (Ramos, 2019). As defended in Zahm *et al.* (2008), assessment methods should aim to characterize key concepts taken from the definition of SD, while being at the same time scientifically sound, relevant to the issue being studied,

sensitive, easily accessible and comprehensible among end users. An accurate and functional assessment tool must for that matter focus and clarify what exactly needs to be measured, and also what to expect from the results (Ramos, 2019).

## METHODOLOGY

In this section the research methodology and the sources of the data analyzed are presented. A structured literature review was conducted in order to comprehend major limitations and gaps regarding sustainability assessment practice, followed by an exploratory analysis designed to identify and scrutinize distinguished sustainability assessment methods proposed all over the world by a plethora of sectors.

After identifying major available sustainability assessment methods, a categorization analysis was therefore conducted by observing pivotal content, common grounds and differentiating features. Through such approach it was possible to explore and compare several assessment tools on the same basis. This study was structured twofold: first we started by reviewing what has been said on sustainability meaning and its measurement effectiveness. For such all peer-reviewed scientific journal volumes and issues published until 2020 were searched using major online citation databases - Science Direct/Scopus, Web of Science and Google Scholar. The search was focused over the keywords "sustainab\* assess\*", and "agri\*". A preliminary overlook on the title and abstract of 621 papers was undertaken to verify if they fit the scope of this study, and to identify key authors or references. From here, a snowball sampling strategy was mostly used to enhance the process by deep reviewing 138 of the most relevant cited references. One of the key criteria was to select all studies validating or testing some type of sustainability assessment methodology. Following this step we proceeded into an overview and categorization off assembled sustainability tools, identified as capable to properly evaluate different production systems. For such, 3 main categories and 1 minor were explored: i) spatial level covered; ii) fundamental dimensions of sustainability considered; iii) main sectorial coverage; and iv) peer reviewed tool. The fourth category was added in order to support further validation opportunities. All categories are presented and described in Figure 1.

| Categories |                           | Importance   |
|------------|---------------------------|--|
| (i)        | Scale and Levels          | Scale concept refers to the spatial, temporal, quantitative or analytical dimensions used by scientists to measure and analyze objects and processes, while levels on the other hand refer to locations in the scale. The perception of scale is decisive when dealing with sustainability assessment, and nowadays it is already possible to measure and monitor agricultural sustainability at different scales and levels.<br>Spatial scale: (1) farm-level; (2) regional-level; (3) national-level; (4) global-level<br>Production scale: (5) product-level; (6) farm-level; (7) sector-level                                    |
| (ii)       | Sustainability Dimensions | Sustainability is considered a dynamic concept - seeking to achieve a balance in space and time; and normally involves at least three independent but interrelated dimensions – ecological, social and economic.<br>(1) Environmental (2) Social (3) Economic (4) Institutional  |
| (iii)      | Sectorial Levels          | Sustainability assessment methods are being developed and proposed all over the world, to a plethora of sectors. It is important to use consistent classifications and definitions at sectoral levels.<br>(1) Universal (2) Agrifood (3) Permanent crops (3.1) Viticulture (3.2) Coffee (3.3) Cocoa (3.4) Fruit trees<br>(4) Smallholders (4.1) Peasant farming (5) Horticulture (5.1) Greenhouse production (6) Annual crops (6.1) Rice farming<br>(6.2) Arable farming (6.3) Sugar cane (7) Livestock (7.1) Poultry (7.2) Dairy<br>(8) Manufacturing (8.1) Bioenergy (8.2) Biofuel (8.3) Oil companies (8.4) Palm Oil (9) Forestry |
| (iv)       | Peer Review               | The validity of Sustainability Assessment Tools based on journal peer review is seen as critical once it constitute true performance indicators that such are capable of evaluating a reasonably valid assessment of a certain production system.<br>(1) Yes (2) No  |

Figure 1. Categories and variables used to categorize identified sustainability assessment tools.

## RESULTS AND DISCUSSION

This reviewing process over specialized literature on sustainability meaning and ways to assess it, was the foundation for the identification and selection of major sustainability assessment tools developed and available worldwide until this present moment. After scrutinizing major cited references on this subject we were able to identify 105 different sustainability assessment tools developed by a plethora of sectors. Following their identification, all instruments were listed for further analysis, with an initial description on relevant categorization and classification understandings. As shown in the full list provided in the appendices (Table 1), from individual indicators, to indicators-set, composite index and frameworks, all distinguished tools were listed, organized and categorized afterwards accordingly to: i) official name; ii) spatial levels covered; iii) sustainability dimensions considered; iv) major sectorial comprehensiveness; and v) the main reference.

First impressions confirm the statement from Dantsis et al. (2010) regarding an extensive number of developed tools until this date, along with their heterogeneity by differing in all categories determined at this stage. Another remark is in regard the most common features reported among literature between the most prominent assessment tools (Figure 2). Results confirm that, despite this vast display of different instruments presented as sustainability assessment tools, the reality is that the majority continue to focus on particular affairs already pointed out by specialists in literature - such as environmental evaluation at farm-level scale. On the other hand, and as expected, agricultural sciences show a leading concern over this subject, where a clear dominance of tools developed to evaluate sustainability in agricultural systems, is also shown.

Figure 2. Illustration comparing 5 of the most common features reported among literature, being covered by all 105 identified assessment tools on spatial level, sectorial level and sustainability dimensions. The 3 pillars variable in the category of dimensions of sustainability, is regarding the three fundamental TBL components, where the 4 pillars variable adds the institutional component

Thus, main results point to a notable supremacy of tools capable to assess sustainability at farm-level, showing a proportion of 65 tools designed for such, out of the 105 instruments. Such findings are in concordance with previous conclusions stated in literature, such as in Hayati (2017) and Rosnoblet et al. (2006). Both remarked how assessments at farm-level continue to be the most studied ones, as it facilitates the appraisal process by allowing a better weigh up and trade off in a meaningful way. In regard major sustainability dimensions being covered by developed assessment tools, despite the TBL perspective continues to gain a considerable support among specialists – not only from the conceptualization of sustainability meaning, but also among the methodologies developed to assess such, there is still a reluctant single-domain prevalence and preference on the environmental scope. In summary, despite a manifold of tools being developed until this present to evaluate sustainability levels, an affinity towards environmental concerns continues to endure over a more holistic perspective - with 46 out of 105 tools being designed to only evaluate environmental affairs, versus 34 presented as capable to cover all 3 fundamental pillars of sustainability: economic, social and environmental. Thus, the claim defended by Binder et al. (2010), Bockstaller et al. (2008), Rosnoblet et al. (2006), and Thiollerscholtus and Bockstaller (2015), regarding the fact that most of the measurements conducted so far tend to focus predominantly either on environmental concerns or specifically on assessing certain impact categories, continues to be valid at this present. Subsequently, statements from Rosnoblet, Girardin, Weinzaepflen, & Bockstaller (2006), claiming that other categories such as social and economic started to be gradually introduced into sustainability-related studies by academia since 1995, were clearly not confirmed by our results. As shown in Table 1, only 2 designated sustainability tools of the full list were specifically developed to evaluate social-related evidences, and 9 out 105 specifically assessed economic domains, against 46 tools designed to merely assess environmental affairs.

Finally, in regard the sectorial level of comprehensiveness – and as expected due to our search keywords, instruments developed to assess agrifood systems were dominant among the full list of 105 tools. However, when scrutinizing each domain of the agricultural league, there was a clear inclination for methodologies expressly developed to assess arable crops. Thus, here too results confirm statements

shared by specialists, such as Hayati (2017) and Thiollet-scholts and Bockstaller (2015). On the other hand, despite being defend among literature how tools of this nature should be context-specific, the reality is that one quarter was labeled as universal (27 out of the 105 tools).

## CONCLUSIONS

This section shows how the work advances the field from the present state of business knowledge base. In order to advance understandings over sustainability assessment through a categorization analysis, a strategic and critical review was developed. To begin with, an extended structured literature review allowed to identify key essentialities to take into consideration when willing to properly and holistically assess the sustainability level of any given complex system. The goal was to gather relevant information regarding critical sustainability assessment challenges and its limitations, along with key insights on assessment effectiveness - which proved to be crucial when upholding any categorization criteria and to discuss the results. From such exploratory approach, a total of 105 available sustainability assessment tools designed all over the world by different sectors were also identified and listed. Despite our initial search focused over sustainable agriculture due to its intrinsic relevancy on this pursuit towards sustainable development, our main goal was to deep comprehend and explore distinguished tools, through a categorization analysis perspective. All categories analyzed were grounded over a set of established criteria supported by literature: from their spatial level covered, to main sectorial comprehensiveness, to the sustainability domains considered.

Findings confirmed several evidences found among literature – from a considerable number of sustainability assessment tools developed until this date, along with its heterogeneity regarding their scope, content and structure, to a clear domain of farm-level assessments over environmental domains. An interesting evidence was regarding the sectorial comprehensiveness of most tools. As expected, the grand majority of tools listed in this work were developed to assess agricultural systems. However, there was a considerable affinity towards arable crops, confirming once again previous statements from the literature. On the other hand, a curious finding was in regard the fact that one quarter of all 105 tools analyzed, was labeled as universal tool. This result can be a signal of unconformity and unreliability among assessment tools, due to the realization that any sustainability evaluation must be linked to the context in which the system operates. By recognizing that sustainability - a dynamic time-specific and location-specific concept, is built over a perpetual search for balance and equilibrium, implies that any assessment tool designed to appraise any business, has imperatively to assure context comprehensiveness. The reality is that among the vast abundance of tools available nowadays to assess sustainability – beyond the incessant focus on environmental concerns, the fact that a considerable portion shares a clear affinity towards arable farming, while the other does not assure any context

specificity at all, allows us to conclude that currently it is still difficult to find proper methods capable to evaluate accurately and holistically a certain good, activity or system. Also, this inadequacy among assessment tools characterized by biased and flawed design, can be pointed as an important drawback on our urgent pursuit for a more sustainable world.

To finalize, this work can also contribute to engage business managers and stakeholders to embrace the importance and weight of social and economic pillars when aiming for a complete assessment of sustainability. Regardless the field business base we are dealing with, it is imperative to apply a multidisciplinary perspective when aiming to measure or promote sustainable development. Thus, it is not only necessary to assure adequate scales and levels of assessment in order to have access to all fundamental information, but also to accept that simply focusing over environmental affairs is already not sufficient in our modern world. It is therefore necessary to integrate economic models linked to assessment systems based on human well-being in order to succeed in this search for sustainability.

The authors of this work acknowledge the limitations associated with research of this nature - regarding validity, reliability, and generalization of findings. Nevertheless, our findings are seen as a fundamental initial leap, for providing relevant features on common ground over 105 distinguished sustainability assessment tools from different sectors. This study can therefore be seen as a first-glance guideline to assess or develop a sustainable business – either in the agricultural sector or beyond. However, due to the inaptitude to assure fundamental factors identified as essential for the effectiveness of the assessment procedure, we encourage further research over spotted tools, where multivariate methods with different algorithms and statistical tests should also be used upon the analysis.

## **ACKNOWLEDGEMENTS**

This work was supported by the R&D Project INNOVINE & WINE – Vineyard and Wine Innovation Platform - Operation NORTE -01-0145-FEDER-000038, co-funded by the European and Structural Investment Funds (FEDER) and by Norte 2020 (Programa Operacional Regional do Norte 2014/2020); by national funds, through the FCT – Portuguese Foundation for Science and Technology under the project UIDB/04011/2020; by ADVID - Associação para o Desenvolvimento da Viticultura Duriense; and in part by the 2019 I&D Research Award from the Fundação Maria Rosa.

# THE IMPACT OF MENTORING ON WORK-FAMILY BALANCE AND JOB SATISFACTION: THE MEDIATING ROLE OF WORK DEMANDS AND FLEXIBILITY

Tsagkanou, Maria; Polychroniou, Panagiotis; Vasilagkos, Tryfon

Department of Business Administration, University of Patras, Patras, Greece

## ABSTRACT

**Purpose**– This study aims to investigate the relationship between work-family balance (WFB), job satisfaction and mentoring in the Greek hotel organizations. In particular, it investigates how mentoring contribute to career and family life outcomes with an additional emphasis on the role of the working environment (work demands, time & schedule flexibility).

**Design/methodology/approach**– The data were collected from 104 hotel managers. Correlation analysis and multiple linear regressions were performed in order to test our framework.

**Findings**– The findings indicate that both job satisfaction and career mentoring have a positive impact on WFB, while socioemotional mentoring has a negative impact. Furthermore, we found that work demands and (time & schedule) flexibility are negatively associated both with WFB and job satisfaction.

**Practical implications**– Understanding the nature of the association between WFB, job satisfaction and mentoring, would enable academics and human resource managers to reflect critically on the effect of mentoring on WFB and job satisfaction in the hotel context, as well as the role of the working environment to achieve sustainable competitive advantage.

**Originality/value** – This is a first study which develops a model to explore the relationship between work-family balance, job satisfaction and mentoring in hotel industry emerging the need of supportive policies to the balance between the two domains of life.

*Keywords* Work-family balance, Job satisfaction, Mentoring receipt, Work demands, Flexibility, Hotel organizations.

## INTRODUCTION

The hotel industry is considered one of the most difficult for balancing work and family domain. This is because of the increasing global competitive environment and the demanding working conditions

(long and unusual working hours, workload, direct contact with customers, etc.). Hotel employees often sacrifice family responsibilities and personal lives to ensure the efficiency and quality of services (Karatepe and Uludag, 2008; Mulvaney *et al.*, 2007).

Many studies give emphasis on workplace issues that are likely to impact on employee attitudes in order to develop strategies to improve both individual and organizational performance (Zopiatis *et al.*, 2014). A part of researchers from different scientific fields examine the conflict of a person's two domains of work and family life as a causal link influenced by several intrinsic and extrinsic factors (French *et al.*, 2018). Moreover, another part of researchers focus on the differences arising from the impact of work flexibility on job satisfaction and the conflict between work and family life (Jang *et al.*, 2011; Scandura and Lankau, 1997).

A crucial question arises from the hotel context is if the existing "family-friendly" related practices are adequate for employees to deal with their daily family responsibilities (Wong and Ko, 2009). The literature suggests that mentoring positively affects the commitment and satisfaction of employees (Allen *et al.*, 2004; Bozionelos *et al.*, 2011; 2014; Janssen *et al.*, 2016). Against this backdrop, this study aims to fill a significant research gap because of the lack of mentoring research in the hotel sector. A key contribution of our study concerns the research of the role of mentoring in hotel managers' work-family balance. The main cause is the need for mentoring programs as a strategy for their professional development and mental health (Rutherford, 1984; Rutherford and Wiegstein, 1985). According to our knowledge this is a first study which develops a model to explore the relationship between work-family balance, job satisfaction and mentoring in the hotel industry, emerging from the need of supportive policies to the balance between the two domains of life.

The following section describes the theoretical background of this study. Afterwards, hypothesis development is provided, a detailed description of the measurement model and the conceptual framework is presented and finally discussion of the results and conclusions are demonstrated.

## LITERATURE REVIEW

### *Work-family balance (WFB)*

In relative literature we meet many definitions and theoretical approaches of WFB. The previous research categorizes these definitions based on two main elements: a) the role enrichment in work / non-work life and b) the minimal conflict (role conflict) between work and non-work roles (Sirgy and Lee, 2018). A definition that is accepted in general refers to employees' perceptions that the domain of personal time and family care and the domain of work reconciled with minimal role conflict and that individuals are equally satisfied with their roles (Allen *et al.*, 2000; Clark, 2000). Other authors define WLB as a high degree of role enrichment with a low degree of role conflict in work and non-work life

domains (Frone, 2003; Greenhaus and Powell, 2006). On the other hand, Greenhaus and Beutell (1985) define work-family conflict (WFC) as the negative interaction between work and family where the individuals take on too many responsibilities at work and at home.

The existing longitudinal studies come in accordance with the vast majority of outcomes of WLB for the employees and organizations (Frone *et al.* 1992; Adams *et al.* 1996; Netemeyer *et al.* 1996), as job satisfaction, family satisfaction (Carlson *et al.*, 2009) organizational performance, affective commitment, absenteeism, turnover intentions, physical health, satisfaction of personal time (Allen *et al.*, 2000; Aryee *et al.*, 2005; Greenhaus *et al.*, 2006; Carlson *et al.*, 2009).

#### *Job satisfaction*

Job satisfaction is defined as the enjoyable emotional state ensuing from appraisal of one's job and job experience (Locke, 1976). Christen *et al.* (2006), in their attempt to make clearer the previous literature gap on job satisfaction definitions, propose a model that includes personal characteristics, perceptions of roles and organizational variables (job and organizational performance). They are based on relationships that empirically demonstrate in meta-analysis Brown and Peterson (1993).

A large group of authors investigate the importance of personal characteristics (Judge *et al.*, 2000; Mount, 2006; Bruk-Lee *et al.*, 2009; Steel *et al.*, 2019), the impact of the working environment (Clark, 1997; Van den Broeck *et al.*, 2008; Dimitriades and Papalexandris, 2011; Raziq and Maulabakhsh, 2015) and the effect of flexible working arrangements on job satisfaction, that can be either positive (Baltes *et al.*, 1999; Droussiotis and Austin, 2007; Kelliher and Anderson, 2010, De Menezes and Kelliher, 2017) or negative (Morganson *et al.*, 2010; Silla and Gamero, 2014).

#### *Mentoring*

According to Kram (1985), mentoring is defined as a developmental relationship between two individuals, the mentor and the protégé, through which the mentor provides career-related (e.g., challenging assignments, exposure and visibility, and coaching) and socioemotional (e.g., friendship, counseling and role modeling) function for the protégé. The career development function allows mentees to improve their working performance, succeed their career goals and encourages them to aggressively take advantage of mentoring (Viator, 2001; Allen *et al.*, 2008). The socioemotional mentoring can improve mentees' work performance and desire to work for their organization (Kram, 1985; Allen *et al.*, 2008).

Empirical estimations by researchers show that mentoring has a direct positive effect on job satisfaction and job performance (Lankau and Scandura, 2002; Pan *et al.*, 2011; Van Vianen *et al.* 2018), career development (Ragins *et al.*, 2000; Allen *et al.*, 2004; Bozionelos *et al.*, 2011), organization commitment (Eby *et al.*, 2013), turn over intentions (Payne and Huffman, 2005; Van Vianen *et al.*, 2018) and other positive physical/psychological consequences (Eby *et al.* 2008; Bozionelos *et al.*, 2014).

## HYPOTHESES DEVELOPMENT

Empirical evidence shows that WFB increases job satisfaction (Carlson *et al.*, 2011). Haar *et al.* (2014) in a cross-country survey of seven different cultures showed that WFB is positively related to job satisfaction and life satisfaction. In line with these results, Mulvaney *et al.* (2007) proposed a model of work-family life for hotel managers where show the positive association between WFB and job satisfaction. Moreover, several studies in hospitality industry show as well that conflict between work and family domain negatively associated with job satisfaction (Namasivayam and Zhao, 2007; Karatepe and Bekteshi, 2008; Zhao and Ghiselli 2011).

Furthermore, a recent study by Van Vianen *et al.* (2018) shows that employees who received more career mentoring were more satisfied with their job and had a stronger career motivation. This finding is supported by several previous studies that indicated a positive association between mentoring and job satisfaction (Kram, 1985; Scandura, 1992; Allen *et al.*, 2004; Lankau *et al.*, 2006). Lankau and Scandura (2002) advocate that only career mentoring bring outcomes to the protégés. Kammeyer-Mueller and Judge (2008) found that career mentoring is positively related to job satisfaction, whereas socioemotional mentoring is negatively related to job satisfaction. On the contrary, Payne and Huffman (2005) indicated that socioemotional mentoring encourages employees to be more satisfied with their jobs. More specifically, in hotel industry researchers concluded that all mentoring functions had a significant and positive effect on job satisfaction (Kim and Hwang, 2015). However, none research highlights the interaction effects between WFB, job satisfaction and mentoring functions. Therefore, we estimate to extent previous literature by examining the above relationship in hotel context.

Thus, we propose the following hypotheses:

**H1a.** Work – family balance (WFB) is positively related to job satisfaction and career mentoring.

**H1b.** Work – family balance (WFB) is positively related to job satisfaction and negatively related to socioemotional mentoring.

According to Spector *et al.* (2007) working hours and workload are used as the main indicators of *work demands*. The authors suggest that individuals with greater workloads are likely to expend more effort, which should increase strain-based work-family conflict. Several studies show that long working hours and heavy workloads are antecedents of WFC (Greenhaus and Beutell, 1985; Frone, 2003). Furthermore, it is highly plausible that there is a positive association between work demands, WFC (Frone *et al.*, 1997; Byron, 2005) and job dissatisfaction (Allen *et al.*, 2000; Aryee *et al.*, 2005; Spector *et al.*, 2007).

Additionally, a small part of researchers focus on the positive effect of *time flexibility* on job satisfaction (Scandura and Lankau, 1997; Costa *et al.*, 2006; Kelliher and Anderson 2008; Taqatqa and Aljbour, 2017) and work–life balance (Jang, 2009; McNall *et al.*, 2009; Galea, *et al.*, 2014). Moreover, *schedule flexibility* is proved that associated with increased job satisfaction and reduced WFC (Jang, 2009; Carlson *et al.*, 2010; Michel *et al.*, 2015). Especially in hotel industry, Karatepe and Uludag (2008) point out that long work hours, work on weekends, irregular and inflexible work schedules are antecedents of work–family conflict.

Taking into consideration both the empirical and theoretical literature, we propose the following hypotheses

**H2.** Work-family balance (WFB) is negatively related to work demands and positively related to time and schedule flexibility.

**H3.** Job satisfaction is negatively related to work demands and positively related to time and schedule flexibility.

## METHODOLOGY

### *Sample and procedure*

Data were collected from 104 managers that work on different levels of management and departments of four and five star hotel organizations in Greece. We addressed to managers because they tend to work long hours and have high levels of responsibility and demands at work (Brett and Stroh, 2003). The questionnaires with cover letters were delivered to general managers in these hotels emphasizing that participation was anonymous and voluntary. From the 120 returned responses 16 were not usable because of significant missing information.

The participants consisted of 54% males and 46% females. The age of respondents was between 34-38 years on average. Around half of them were unmarried (56.1%), while 43.9% were married. Most managers had no children (65%) and elderly protected people (83%). They oversee a large range of tasks as Assistant HR Manager, Sales and marketing Manager, Sales/Reservations Manager, Marketing/Public Relations Manager, Assistant Operations Manager, Reception Manager.

### *Measurement*

All the measures were originally developed in English. Therefore, we translated all measurement from English to Greek. All items were measured using a five-point Likert scale ranging from “1 = strongly disagree” to “5 = strongly agree”.

*Work-family balance (WFB).* Work-family balance was measured by a six-item scale development by Carlson *et al.*, (2009). Both the Kaiser-Meyer-Olkin (KMO) test and Bartlett's Test of

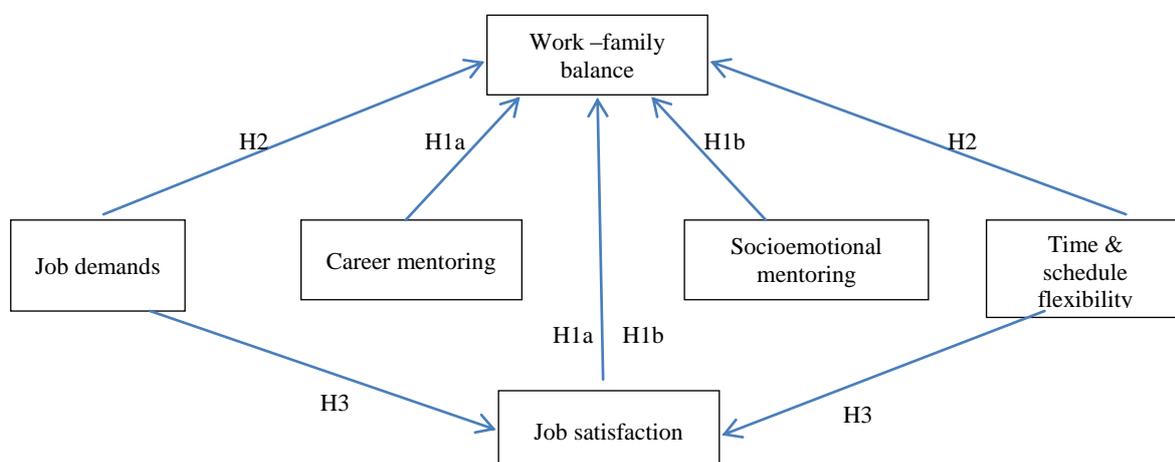

Sphericity ( $\chi^2$ ) were satisfied in terms of significance (KMO=0.903,  $\chi^2=734.726^{***}$ ). They explain the 84.254% of the variance. According to Cronbach's alpha coefficient, the scales used to measure work-family balance acquired internal consistency (0.962).

*Job satisfaction.* General job satisfaction and facets of job satisfaction were measured using 19 items of the Job Diagnostic Survey developed by Hackman and Oldman (1980). Both the Kaiser-Meyer-Olkin (KMO) test and Bartlett's Test of Sphericity ( $\chi^2$ ) were satisfied in terms of significance (KMO=0.927,  $\chi^2=2567.233^{***}$ ). The two-factor structure accounted for 78.880% of the variance. The internal consistency estimates (Cronbach's  $\alpha$ ) for these two domains were 0.859 and 0.983 which confirm good internal consistency of the items within each domain.

*Mentoring receipt.* Mentoring receipt was a measurement with eighteen items on a five-point response (1: not at all, to 5: to a great extent) from Dreher and Ash (1990). The Kaiser-Meyer-Olkin (KMO) test and Bartlett's Test of Sphericity ( $\chi^2$ ) both showed satisfactory levels (KMO=0.931,  $\chi^2=2558.859^{***}$ ). The two-factor structure (career-related and socioemotional mentoring) accounted for 78.977% of the variance. The internal consistency estimates (Cronbach's  $\alpha$ ) for these two domains were 0.921 and 0.976 which confirm good internal consistency of the items within each domain.

*Work demands.* Perceived workload was assessed with Spector and Jex's (1998) quantitative workload inventory (QWI), a 5-item measure of perceived quantitative workload. "The Kaiser-Meyer-Olkin (KMO) test and Bartlett's Test of Sphericity ( $\chi^2$ ) both showed satisfactory levels (KMO=0.776,  $\chi^2=337.758^{***}$ ). They explain the 69.604% of the variance. According to Cronbach's alpha coefficient, the scale had internal consistency (0.881).

*Time and schedule flexibility.* In line with other researchers (Thomas and Ganster, 1995; McNall *et al.*, 2009), we measure access to benefits rather than usage because we interest in the availability of work-family programs as a symbol of organizational concern for work and family issues. Specifically, participants were asked, "Do you have flexibility on your working time and schedule?" We assign 1 to participants who answered *yes* and 0 to participants who answered *no*.

**Figure 1. CONCEPTUAL MODEL****RESULTS***Descriptive statistics*

**Table 1** shows the means, standard deviations and correlation coefficients among the study variables. Work-family balance is positively related to overall job satisfaction ( $r=0,819$ ,  $p<0.01$ ), career mentoring ( $r=0,677$ ,  $p<0.01$ ) and socioemotional mentoring ( $r =0,400$ ,  $p <0.01$ ). In addition, work-family balance and job satisfaction are negatively related to work demands ( $r=-0,474$ ,  $p <0.01$ ,  $r =-523$ ,  $p<0.01$ ). However, both are negatively related to (time & schedule) flexibility ( $r=-0,280$ ,  $p<0.01$ ,  $r =-0,259$ ,  $p <0.01$ ).

| Variables  | SD       | Mean    |         |         |       |         |        |   |

**Table1. MEANS, STANDART DEVIATIONS AND CORRELATIONS***Hypothesis testing*

Initially we test the relationship between WFB, job satisfaction and career mentoring and WFB, job satisfaction and socioemotional mentoring. We use the multiple linear regression model where the parameter estimations are obtained by the least squares method. In contrast to theory, career mentoring and socioemotional mentoring are not statistically significant. For this reason, we test of hypotheses of linear model. First, no problem of multicollinearity exists between the independent variables because the variance inflation factors are lower than 10 ( $VIF=2.5853$ ,  $VIF=1.389440$ ). Additionally,  $p$  value of Breusch-Godfrey Test is 0.9863 and 0.9792 respectively. Therefore, we do not reject the null hypothesis of no correlation of residuals. Moreover, there is no problem of heteroskedasticity, because Heteroskedasticity Test shows higher  $p$  value (0.5458, 0.5220). Thus, we do

not reject the null hypothesis of homoscedasticity. The Jarque-Bera Test shows high price ( $\beta=25.76858$ ,  $p=0.000003$ ,  $\beta=26.99575$ ,  $p=0.000001$ ). Thus, we reject the null hypothesis of normality, which means that the residuals do not follow normal distribution. In order to solve this problem we adopt the recursive method of bootstrap. This is proper for small sample size and we use one thousand repetitions as recommending by literature (Efron and Tibshirani, 1993). **Table 2** exhibits the results. In particular, the first bootstrapping procedure indicates the significant positive association between WFB, job satisfaction ( $\beta=0.498$ ,  $p<0.001$ ) and career mentoring ( $\beta=0.298$ ,  $p<0.01$ ). Hence, we can accept *H1a*. The second bootstrapping procedure shows that WFB is significantly positively related to job satisfaction ( $\beta=0.882$ ,  $p<0.001$ ) and negatively related to socioemotional mentoring ( $\beta=0.136$ ,  $p<0.01$ ). Therefore, we can accept *H1b*.

| Dependent Variable         | Independent Variables    | Least Squares          | Bootstrapping |
|----------------------------|--------------------------|------------------------|---------------|
| WFB                        | Job Satisfaction         | 0.745***               | 0.498***      |
|                            | Career Mentoring         | 0.093                  | 0.298**       |
|                            | Constant                 | -5.61*10 <sup>-7</sup> | 0.151**       |
| Adjusted R-squared         |                          | 0.667                  | 0.542         |
| Model 2                    | Job Satisfaction         | 0.843***               | 0.882***      |
|                            | Socioemotional Mentoring | -0.046                 | -0.136**      |
|                            | Constant                 | -5.71*10 <sup>-7</sup> | -0.039        |
| Adjusted R-squared         |                          | 0.665                  | 0.699         |
| Note: ** <0.01, ***p<0.001 |                          |                        |               |

**Table 2. BOOTSTRAPPING RESULTS**

As well as, multiple hierarchical regressions are used to test H2 and H3. **Table 3** presents the results. Our findings indicate that WFB is significant negatively related with work demands ( $\beta=-0.465$ ,  $p<0.001$ ) and time & schedule flexibility ( $\beta=-0.558$ ,  $p<0.001$ ). Therefore, the expectation on the nature of the relationship between WFB, work demands and time & schedule flexibility proposed in *H2* is only partially supported. Similarly, *H3* predicted that job satisfaction has a negative association with work demands and positive association with time & schedule flexibility. In model, this prediction received partly support ( $\beta=-0.516$ ,  $p<0.001$ ,  $\beta=-0.510$ ,  $p<0.001$ ) in line with expectations; thus *H3* is partially supported.

| Dependent Variable | Independent Variables       | Unstandardised B | t-Value   |

**Table3. MULTIPLE LINEAR REGRESSIONS**

## DISCUSSION

Our study contributes to the understanding of determinants of work-family balance in hotel industry. The results indicate that both job satisfaction and career mentoring have a positive impact on WFB, while socioemotional mentoring has a negative impact. In addition, we found that work demands and (time & schedule) flexibility associated negatively both with WFB and job satisfaction.

The results raise vital questions for WFB research in hospitality context. First, the findings are consistent with past studies that examine the positive association between WFB, job satisfaction (Mulvaney *et al.*, 2007; Carlson *et al.*, 2011) and career mentoring (Kram, 1985; Scandura, 1992; Allen *et al.*, 2004; Lankau *et al.*, 2006; Kammeyer-Mueller and Judge, 2008). Career mentoring is more related to outcomes for protégés (Kram, 1985; Lankau and Scandura, 2002; Allen *et al.*, 2004; Bozionelos *et al.*, 2011). Probably, this is due to the difficulty of career than socioemotional mentoring providing which reflect greater organizational commitment (Bozionelos *et al.*, 2011). Therefore, WFB is more likely to increase when increase job satisfaction and career mentoring. The interpretation is that protégés are more satisfied with their working environment, resulting in work domain interfere positively with family domain.

Second, our findings also determined the importance of work demands on WFB and job satisfaction. The theories proclaim that work demands have a positive impact on WFC and job dissatisfaction (Frone *et al.*, 1997; Allen *et al.*, 2000; Aryee *et al.*, 2005; Byron, 2005; Spector *et al.*, 2007). Additionally, our research measured the WFB and we found that work demands (workload) were predominant than (time & schedule) flexibility to increase WFB. Future research can build upon these results by investigating the above variables in association with mentoring functions.

Third, interestingly, our results are inconsistent with prior work linking the positive impact of (time & schedule) flexibility on WFB (Karatepe and Uludag, 2008); our findings reveal the negative impact of flexibility on WFB. On the same wavelength, Mesmer-Magnus and Viswesvaran, (2006) suggest that if employees are not using the benefits of flexibility, these are not capable to reduce WFC. Indeed, hotel managers are more likely to work strongly and not use the time and schedule flexibility because of the customer's pressure with face to face / voice to voice contact and pressure working conditions

(irregular hours, working on weekends). Furthermore, we found that flexibility has a negative impact on job satisfaction. Regarding De Menezes and Kelliher, (2017) job satisfaction may be mitigated by the potential insecurity of an informal flexibility arrangement which is resulted from negotiation directly between the employee and their line manager. Future research should verify our findings in different industry contexts.

This study aids to knowledge and understanding of the determinants of WFB and job satisfaction in the hotel industry, highlighting the importance of career mentoring. We focus on the side of hotel managers because their responsibilities are more likely to prevent balancing two domain of life. It is claimed that hotel managers need mentoring programs for their professional development and mental health (Rutherford, 1984; Rutherford and Wiegenstein, 1985). Other studies could extent research by examining the relationship between WFB, job satisfaction and mentoring using data from dyads of mentors-protégés for a more robust investigation to establish an unequivocal conclusion.

## CONCLUSIONS-IMPLICATIONS

In summary this framework could turn the attention of hotel organizations to effective human resource management practices such as mentoring programs and formal flexible arrangements. Regarding the working environment, organizations should provide more formal flexible arrangements (e.g. telecommuting, childcare, elder care assistance) to increase the performance and profitability. Future research could examine which specific work-family support policies and practices can most benefit employees and organizations.

This is a first step for examining the effect of mentoring on hotel managers' WFB and job satisfaction. In the case of Greece, hotel industry is the most vital part of tourism and its significant growth has positively affected the main tourist data and performance indicators in the country. We conclude that HR management has a foundation upon which to begin creating strategies that contribute to organization goals by helping employees to achieve WFB (Grzywacz and Carlson, 2007).

Moreover, additionally research is needed to understand more factors affecting work-family balance, job satisfaction and mentoring in hotel context, such as the national economic environment and the crisis of covid-19, which is expected to cause negative consequences in the hospitality industry.

## TAX AGGRESSIVENESS AND FIRM VALUE: IS THE COMPOSITION OF CORPORATE BOARD DECISIVE?

Vacca, Andrea; Iazzi, Antonio; Maizza, Amedeo

Dept. of Management, Economics, Mathematics and Statistics, University of Salento, Italy

### ABSTRACT

This paper investigates the moderating role of corporate board on the relationship between the adoption of a tax strategy and firm value. Using a multivariate regression analysis, this study shows interesting empirical results. Firstly, this paper highlights that the independent directors and gender diversity within corporate board do not influence the relationship between tax aggressiveness and firm value. Conversely, the size of a corporate board has a negative impact on the relationship between the adoption of a tax strategy and firm value. Therefore, a corporate board made up of few directors represents a key corporate governance mechanism suitable to protect shareholder value from the risks associated with the adoption of a tax planning by a firm.

*Keywords: Corporate Board, Corporate Governance, Firm Value, Tax Planning*

### INTRODUCTION

Tax planning or Tax aggressiveness represents an emerging field of research, not only in accounting and legal matters, but also in other different fields of literature. This circumstance is due, on one hand, to the linkage between tax issues and the concept of corporate social responsibility and on the other hand, to the recent global economic financial crisis which has weakened the public finance structures of several countries.

Tax planning is a managerial practice implemented by companies for the exclusive purpose of increasing their net profit through reduction in their tax burden in compliance with the countries' legislation (Dowling et al., 2014). Therefore, it represents one of the various strategies preferred by shareholders, which is adopted by a firm (Huseynov et al., 2012). However, tax planning is a risky strategy since it involves various consequences in the long term for a company. A firm that exercises a high level of tax aggressiveness may indeed face litigation with tax authorities, leading to the undesired consequence of bearing further monetary and non-monetary costs deriving from the reputational damage (Hanlon et al., 2009). The Agency Theory states that the negative consequences deriving from the adoption of a tax planning could damage shareholder value whether costs in long term are greater than benefits in short term (Desai and Dharmapala, 2006). From this perspective, because of the separation of ownership and management within a large company, there exists a

divergence of interests among the shareholders and managers. Specifically, managers could engage in a risky level of tax aggressiveness, increasing their gains in short term at the expense of decreasing the shareholders' value due to the emergence of the negative consequences of a tax planning adopted (Vacca et al., 2020).

Part of literature (Armstrong et al., 2015; Slemrod, 2004) argues that there exists a certain level of tax aggressiveness appropriate to enhance firm value, without incurring the negative consequences resulting due to the adoption of a tax strategy.

According to the Agency Theory, corporate board constitutes the connection between the objectives of the owners/shareholders and the behaviors of managers, thereby preventing the occurrence of conflicts of interests within a company (Jensen e Meckling, 1979). Indeed, part of literature (McClure, 2018; Wahab et al., 2017) attributes a pivotal role to the corporate board in defining the level of tax aggressiveness of a firm, as this board is responsible for planning the corporate strategy and for monitoring its effectiveness to protect shareholder value (Rose et al., 2007).

Based on these arguments, the aim of this research is to study the moderating role of corporate board on the relationship between the adoption of a tax planning and firm value. Specifically, this paper discusses the influence of specific characteristics of corporate board such as size, gender diversity and independence on the effectiveness of a tax strategy adopted by a firm to increase in firm value.

## LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT

In an increasingly competitive and globalized world, large companies are called upon to ensure the distribution of high dividends to their investors. For this purpose, firms adopt tax planning strategies to reach competitive advantage against competitors and consequently to increase shareholder wealth (Huseynov et al., 2012). Therefore, tax management constitutes a strategic behavior for a company in order to minimize the cost of tax liabilities and improve the distribution of earnings per share (EPS) to investors.

However, the adoption of tax strategy could also entail various risks for a company, which are represented by compliance costs with tax administration and the reputational costs (Hanlon et al., 2009), as despite tax planning does not infringe the law, it is negatively viewed by the public opinion, since it is contrary to the interests of the community in which a company operates (Landry et al., 2013). Furthermore, adoption of tax planning by a firm entails negative consequences for the public finance, as the State has less availability of resources to provide public services to the community (Freedman, 2003). This has a consequent increase in political and social pressure on business decisions, which can lead to consumers boycotting the goods produced or services offered by an organization (Whait et al., 2018). Additionally, a tax strategy could become a cause of conflict of

interests between shareholders and managers. Indeed, this strategy represents an important tool for managers to increase their gains in short term by engaging in risky levels of tax aggressiveness at the expense of reducing shareholder value in the long term due to incurrence of the costs associated with it (Desai and Dharmapala, 2006).

A large part of the literature studies the effects of the adoption of a tax planning strategy on firm value, showing contradictory empirical results.

Some authors (Desai and Dharmapala, 2009; Kiesewetter et al. 2017) do not find any relationship between tax aggressiveness and firm value. In contrast, some researchers (Assidi et al., 2016; Tang et al. 2019) argue that tax aggressiveness is positively associated with increased firm value. Another part of the literature (Chen et al., 2014; Christina, 2019) shows a negative relationship between the adoption of a corporate tax strategy and firm value.

The above mentioned negative empirical results suggest that the potential cost associated with the engagement in a high level of tax aggressiveness did not allow a firm to maximize shareholder value, despite the fact that a decrease in the tax burden increases the net profit for a company with a consequent increase in the shareholder wealth.

Based on this, it can be stated that the corporate board, which is responsible for planning the corporate strategy (Rose et al., 2007), plays a pivotal role in defining a suitable level of tax aggressiveness of a firm to protect shareholder value, thereby preventing the risks associated with any such strategy. In fact, this body considers taxes as one of the many factors that a company must manage, as it can have significant influence on its decision-making process (KPMG, 2005).

Part of literature shows that some specific characteristics of the structure of a corporate board affect the attitude of a firm towards committing to high levels of tax aggressiveness. Some authors (Minnik and Noga, 2010; Wahab et al., 2017) argue that a corporate board comprising of several directors negatively influence the level of tax aggressiveness of a firm. In the same way, another part of literature (Richardson et al., 2016; Chen et al., 2019) analyzes the impact of gender diversity in corporate board on the orientation of a firm towards adopting a tax strategy, showing that female directors negatively influence the level of tax aggressiveness of a firm.

Conversely, some authors (Minnik and Noga, 2010; McClure et al., 2018) show a positive relationship between higher levels of board independence and the adoption of a tax strategy by a firm, claiming that the independent directors possess good expertise in the matters related to tax.

Based on what was discussed, it is expected that specific corporate board characteristics such as size, independent directors and gender diversity should moderate the relationship between the adoption of a tax planning and firm value. Therefore, the following research hypothesis have been developed.

H1: *The relationship between the adoption of a tax planning and firm value is negatively moderated by*

*corporate board's size.*

H2: *The relationship between the adoption of a tax planning and firm value is negatively moderated by gender diversity on corporate board.*

H3: *The relationship between the adoption of a tax planning and firm value is positively moderated by corporate board's independence.*

## **RESEARCH METHODOLOGY**

The analysis was conducted on a sample of 168 non-financial Italian listed firms on Milano Stock Exchange extracted from the "AIDA Bureau Van Dijk" database. The analysis was carried out by using two consequent research methodologies.

Firstly, a document analysis was performed through the evaluation of annual reports of Italian listed firms to collect the data of the composition of a corporate board.

And finally, to study the moderating role of the composition of corporate board on the relationship between tax aggressiveness and firm value, panel data analysis with fixed effects was performed (Stock and Watson, 2015) on a time interval of seven years (2011-2018) with the determination of 1176 observations.

## **REGRESSION MODELS AND VARIABLES**

*TBQ* measures firm value. It represents the dependent variable of this research calculated by market capitalization plus book value of debts divided by the total asset (Pucheta-Martinez et al., 2018).

The control variables of this study are broadly used in previous studies on corporate governance, tax planning and firm value.

*FSIZ* measures firm size by taking the natural logarithm of the total assets (Pucheta-Martinez et al., 2018).

*LEV* represents the leverage of a firm, and it is represented by the ratio between the book value of debts and equity (Li et al., 2016).

*R&D* represents firm's research and development costs. It is computed by the total of research and development cost divided by total assets (Gupta et al., 2017).

*BS* measures corporate board size. It is computed by taking the natural logarithm of the number of directors that make up the corporate board.

*GEN* measures the percentage of female directors on corporate board. It is calculated as the number of women directors on the board of directors divided by the total number of directors that make up the corporate board.

*BIND* represents the percentage of independent directors on corporate board; it is computed as the ratio between the number of independent directors on corporate board and the size of corporate board.

To measure corporate tax aggressiveness, this research used two different variables, which are *CTP<sub>1</sub>* and *CTP<sub>2</sub>*.

*CTP<sub>1</sub>* represents the index "Effective Tax Rate" (*ETR*) calculated by the ratio between total tax expense and accounting income before tax (Kiesewetter et al., 2017).

*CTP<sub>2</sub>* constitutes the index "Cash Effective Tax Rate" (*CETR*) calculated by the ratio between current-year tax expense and the accounting income before tax (Armstrong, 2015).

*ETR* and *CETR* indexes are inverse measures of tax aggressiveness, therefore lower levels of them could mean a likely adoption of a tax strategy by a firm (Armstrong et al., 2015).

To detect moderating role of the characteristics of the composition of a corporate board on the relationship between tax aggressiveness and firm value, this study used the following independent variables.

*BS × CTP<sub>1</sub>/CTP<sub>2</sub>* measures the interaction effect between corporate board size and the adoption of a tax planning, computed by multiplying the variable *BS* with *CTP<sub>1</sub>* or *CTP<sub>2</sub>*.

*GEN × CTP<sub>1</sub>/CTP<sub>2</sub>* measures the interaction effect between the percentage of gender diversity on corporate board and the adoption of a tax planning, measured by multiplying the variable *GEN* with *CTP<sub>1</sub>* or *CTP<sub>2</sub>*.

*BIND × CTP<sub>1</sub>/CTP<sub>2</sub>* measures the interaction effect between external auditor BIG 4 and tax aggressiveness, measured by multiplying the variable *BIG4* with *CTP<sub>1</sub>* or *CTP<sub>2</sub>*.

To achieve the objectives of this research, the following multivariate regression models were developed for each variable used to measure corporate tax aggressiveness.

*Model 1.*

$$TBQ_{it} = \alpha_{it} + \beta_{1t}FSIZ + \beta_{2t}LV + \beta_{3t}RD + \beta_{4t}CTP_1 + \beta_{5t}BS + \beta_{6t}GEN + \beta_{7t}BIND \\ + \beta_{8t}BS \times CTP_1 + \beta_{9t}GEN \times CTP_1 + \beta_{10t}BIND \times CTP_1$$

*Model 2.*

$$TBQ_{it} = \alpha_{it} + \beta_{1t}FSIZ + \beta_{2t}LV + \beta_{3t}RD + \beta_{4t}CTP_2 + \beta_{5t}BS + \beta_{6t}GEN + \beta_{7t}BIND \\ + \beta_{8t}BS \times CTP_2 + \beta_{9t}GEN \times CTP_2 + \beta_{10t}BIND \times CTP_2$$

| Code | Variable                       | Value |
|------|--------------------------------|-------|
| TBQ  | Firm Value                     | Log   |
| FSIZ | Total asset                    | Log   |
| LV   | Leverage                       | %     |
| RD   | Research and development costs | %     |

|      |                                     |     |
|------|-------------------------------------|-----|
| CTP1 | Effective Tax Rate                  | %   |
| CTP2 | Cash Effective Tax Rate             | %   |
| BS   | Corporate board's size              | Log |
| GEN  | Percentage of female directors      | %   |
| BIND | Percentage of independent directors | %   |

Table 1. Description of the variables

## REGRESSION RESULTS

The results of the multivariate regression analysis reported in Table 2 show interesting empirical results.

First, the study highlights that the size of corporate board ( $BS \times CTP_1/CTP_2$ ) has a negative effect on the relationship between the adoption of a tax planning strategy and firm value. Therefore, the hypothesis 1 is accepted. This data is consistent with the previous studies of Minnik and Noga (2010) and Wahab et al. (2017) that have showed a negative influence deriving by the size of the board of directors on the orientation by a company of adopting a tax planning strategy. This suggests that corporate boards made up of several directors could not represent a critical factor of the governance structure of a firm in preventing the costs associated with the adoption of a tax planning strategy.

Secondly, the results of the analysis show that the level of gender diversity ( $GEN \times CTP_1/CTP_2$ ) on corporate board does not influence the relationship between tax aggressiveness and firm value, thus the hypothesis 2 is rejected.

Finally, in the same way, high level of independence of corporate board ( $BIND \times CTP_1/CTP_2$ ) does not affect the relationship between the adoption of a tax planning and firm value, therefore the hypothesis 3 is rejected.

These results provide evidence that gender diversity and board independence may not constitute a pivotal corporate governance mechanism in preventing the costs associated with the adoption of a tax planning strategy.

## CONCLUSIONS AND MANAGERIAL IMPLICATIONS

This study provides theoretical contributions, enriching the existing literature on the relationship between tax aggressiveness and firm value, while improving the understanding of the moderating role of board of directors' characteristics on the mentioned relationship. Pertaining to the results, this work notes that corporate board size negatively influences the relationship between tax aggressiveness and firm value. Conversely, this study does not note an impact by board's independence or gender diversity on such relationship analyzed.

In addition to the theoretical contributions, this work also carries practical implications.

First, this study helps investors, entrepreneurs, and the general community to understand the role of each player who is responsible for the corporate decision-making process on the effectiveness of a tax planning adopted by the firm. Further, this study helps in understanding the role of such corporate governance mechanisms in protecting shareholder value from the potential risks associated with engagement in a high level of tax aggressiveness by a firm. Specifically, companies with a board made up of few directors are able of planning a tax planning strategy suitable to increase their market value, preventing the potential costs derived by the adoption of such practice.

However, this study carries some limitations. Since the population is only made up of non-financial listed firms on the Milano Stock Exchange, future research could extend the population of this study, taking into account both non-financial firms and financial firms. Additionally, this empirical model could also be tested on other countries' stock exchanges characterized by different legislations and cultures; for instance, exploring the different governance mechanisms in the European Union.

# THE INFLUENCE OF CLIMATE CHANGE ON SUSTAINABLE TOURISM: AN ENVIRONMENTAL THREAT

Van der Bank, Riana

Faculty of Human Sciences, Vaal University of Technology, Vanderbijlpark, South Africa

## ABSTRACT

Irrational exploitation has devastated the ecotourism resources. Therefore, forming the legal system of ecotourism as soon as possible and having laws to abide by can ensure the sustainable development of ecotourism in our country. The goal is to bring to surface the course of action taken by local agents about socio-environmental aspects. What is effective at stake is the transformation of reality upon the opening of channels towards the participation of civil society in the decision-making process. In this paper, we attempt to explore the idea of sustainability within our relationship to the natural environment. Sustainability assumes that natural and human technological resources can be utilized while maintaining the environment. Sustainability must also be understood within the context of ecological, cultural, social, economic and ethical realms. In putting this in perspective, the idea of sustainability becomes more concrete. Amongst a range of environmental constraints that are of necessity playing an increasing role in social development planning, climate change represents the most urgent and far-reaching challenge of our time. This paper is theoretical, with a keen eye on the practical implications of ideas concerning sustainable tourism and enhancing our natural environment

*Keywords: Climate change, economic, environment, human rights, local management, sustainability, tourism, transformation and threat.*

## INTRODUCTION

Many countries in different parts of the African continent are facing urgent environmental threats to their economies due to the phenomenon of climate change and the effect of the tourism industry. South Africa, despite its relative wealth and greater endowment of financial resources and infrastructure, also faces similar problems and threats to its economy. The research approach adopted here was therefore premised on the view that tourist destinations are key sites to analyse the country's capacity to respond, adapt to, and mitigate the effects of climate change and related environmental problems in an integrated manner that is consistent with the other priorities to deliver basic services can be assessed. Key to these issues is analysing tourist destination and policy choices within the framework of sustainability.

When discussing sustainability, one must first understand that its main assumptions are socially supported. Sustainability first assumes that human needs must be met indefinitely without jeopardizing organisms within the environment. Secondly, we must ensure and control of community while maintaining the environment that sustains them.

The issues of sustainability often lie in the competition between economic sectors for the scarce resources of land, water, energy, waste assimilation capacity and human capital. The idea of keeping an overall world view with sustainability in mind, tourism attraction could be redesigned to ultimately be profitable for both the tourists and the environment. Ecological and economic interest should then not be viewed in conflict, particularly at the design level, but that economic activities should be (and indeed must be) profitable while maintaining a sustainable society. Another over all theme to be discussed should be designed to be part of a recycled future and should be returned either as natural or technological nutrients with little or no disposable contents. Sustainability functions must not be developed in a clear linear fashion but more with an overarching consciousness, attempting to see how all the components fit together.

Tourism is currently considered among the economic sectors least prepared for the risks and opportunities posed by climate change and is only now developing the capacity to advance knowledge necessary to inform business, communities and government about the issues and potential ways forward. Sustainable tourism is that which is developed and maintained in a form such that is viable over an indefinite period of time and does not degrade or alter the physical and human environment to an extent that it prohibits the successful development and wellbeing of other activities and processes (Jafari, 2000).

The debate linking tourism with global warming is therefore very polemical: neither camp engaged in the debate sees the other side. Sustainable tourism could be a panacea to mitigate the negative impact of tourism on global warming and by some others as a ploy planted by post-industrial society to divert attention from the core issues. Climate change tends to pose more economic, environmental and cultural challenges to tourism management.

## **METHODOLOGY AND SCOPE**

In this article, various dilemmas, which effect the realisation of sustainable tourism, are outlined. The purpose of this article is to examine our relationship to the natural environment: sustainable tourism. Second, the challenges, which compromise the realisation of our relationship to the natural environment, are rethink. A critical review of relevant literature coupled with original reflections of different authors forms the basis of the basis of this paper. The source of information employed is based on legislation and library research. The following materials were sourced from primary and secondary

sources: South African legislation, policies, jurisprudence, relevant case law, reports practices, customs and traditions. Qualitative analysis is utilised as an analytical tool for this article. The article is divided into four sections. In the first section, the study is introduced and in the second the environment and the importance of local management. In the third section, various dilemmas which compromise Corporate environmentalism and climate change are analysed. The final section contains a general conclusion. In certain ways, this paper is a meta-analysis of the existing literature. It can be said that the objective is achieved since the analysis that leads to the opening of fresh streams of thought and balanced perspectives on politically charged issues.

### **THE ENVIRONMENT AND THE IMPORTANCE OF LOCAL MANAGEMENT**

South Africa's constitutional structure divides the powers and functions of government into three parts namely national, provincial and local. In terms of this division, the national government usually formulates broad policies and sets policy parameters for the country as a whole, while the provincial and local governments are mandated to formulate their own specific policies and programmes and to implement them within these national policy parameters (Mokwena, 2009). In a country like South Africa, which is characterised by historically-determined levels of economic and political inequality, addressing the challenges presented by climate change and sustainable tourism has to be done in a manner that is not only democratic but one that progressively reduces the inequalities of the past. It is more promising to address environmental sustainability issues at micro level, as then it may be possible to achieve a more operational strategy (Nijkamp, 2002). The environment is one of the areas with the most recurring interventions from the municipal government, considering the awareness of spatial frictions and the opportunities in the behaviours of economic actors.

In the presence of environmental degradation by burning, deforesting, altering the climate, one can identify a municipal concern with the environmental issue. An outburst at municipal level reveals the importance of increasing articulations which may stimulate a new attitude from civil society in face of social, economic as well as developmental problems. Each municipality seeks original solutions through innovative actions. If one wants to improve a municipality, one should make it develop by improving the quality of its services and seeking human and economic development. The improvement of the standard of living, the democratization of power and the defense of the environment are the new municipal action mottos. Municipalities are involved in areas concerning the tourism attractions, production, circulation and distribution of assets and services, which contribute to an improvement in the tourism attraction, standard of living and to a more democratic and participative management culture.

Difficulties encountered by municipalities in collecting taxes are related to the population's poor income distribution and to payroll reductions that occurred in the last few years. Another constraint to be highlighted in municipalities is the question of licensing. Few municipalities have the capacity to act towards environmental licensing. Such difficulty consists to assign more independence to municipalities, but justifies itself on the diversity among regions, which does not enable a uniform and strict definition of local impact. The demand for licensing has increased as a response to a cultural change on the part of entrepreneurs, and to a greater performance by environmental agencies. Today two criteria prevail that strict environmental liability: environmental impact and the principle of domain or ownership of the natural resource explored.

The environmental demands foster the democratic participation of society in the use of current and potential resources as well as the construction of a new developmental model. The environmental potential of municipalities, the community self-management of resources and the respect for cultural values offer new possibilities for sustainable development.

## **CORPORATE ENVIRONMENTALISM AND CLIMATE RESPONSE**

Much of the environmental debate revolves around the issue of climate change, and the public also seems to expect corporations and tourism destinations to engage actively with environmental issues (Bullis, 2007). Demonstrating a concern for the environment is a vital building block in acquiring legitimacy, which helps to explain why tourism destinations have increased the level of attention they pay to the issue. Tourist attractions have embraced market-based solutions such as emissions trading, self-regulation, and new technology (Dunn, 2002).

Sustainability and sustainable development are highly contested concepts and the understanding is not dominant in the corporate world. Most agree that sustainability says something about an entity's ability to continue in existence, and that sustainable development combines, and balances concerns about environmental and socio-economic issues (Hopwood, Mellor and O'Brien, 2005). Sustainability has become a concept devoid of meaning, and that no effective or necessary changes are taking place (Welford, 1997). However, others see sustainability as referring to an evolving process that is influenced by a discourse that needs to be opened for public participation (Peterson and Norton, 2007).

The issue of climate change garners significant public attention. This analysis focuses on how corporations and tourist attractions address the issue of climate change rhetorically. This analysis concentrates on the classical notion of topics. Some see topics as a way of thinking creatively about different issues, whereas others have argued that they are a way of justifying claims, and others understand them as the basic elements of enthymemes. Climate change is doubtless the greatest environmental challenge of our day and age. Climate change poses risks to human health and well-

being, risks to the ecosystems and their balance, and risks to the markets we serve. Corporations contribute to the construction of discourses on climate change, thus signalling how serious the challenge is and what can be done about it. Tourist attractions cannot construct their responses to climate change at will and the level of attention varies. The high level of international negotiation is also taken into consideration. The argument of: There is money to be made! The argument goes that tackling climate change head will lead to increased legitimacy and improved reputation, which is thus followed by increased profits. Although there may be something to gain from urging tourist destinations to see self-interest in tackling climate change, this cannot be the only approach. Incentives can be effective in rewarding responsible tourist destinations, civil society still needs to maintain a strong regulatory structure to help keep the externalizing machine that is the modern corporation in check (Bakan, 2004).

About the way's tourist attractions address the climate change issue, the analysis indicates that most of them rely on four topics. The first, gravity is not a special topic that belongs only to climate policy. However, it is also not one of the common topics either.

## **HUMAN RIGHTS PRINCIPLES**

The inclusion of the Bill of Rights in the South African Constitution was done during the interim constitution in 1994. The bill of right contain provisions that are relevant to the protection of the environment. It prohibits the enactment of any law, which is discriminatory. Further, the law prohibits ant enactment whose effect has the potential of being discriminatory.

There are three commonly discussed approaches to examining the interaction between environment protection and human rights. This paper investigates these three approaches to examine if the human rights law regime should subsume the environmental law regime, if the latter should subsume the former or if both the legal regimes should exist separately, with mutual interaction.

First, human rights laws, institutions and processes can be invoked for asserting a right to a clean environment. This usually leads to adopting a rights-based approach to environmental protection with an emphasis on the right to a clean environment. The need to provide a healthy and safe environment, as well as the attainment of social rights for all South African citizens, is necessary and laudable, but difficult to achieve against a backdrop of the need for adequate and cheap energy to meet government priorities of economic and social development. Section 24 of the Constitution is a laudable provision in that it provides a framework for the pursuit of sustainable development, but is quite problematic in that the goal of accelerated economic growth is likely to compromise some of the environmental considerations relating to the advancement of citizen's rights to enjoy a healthy natural environment, especially if the current reliance on coal-based energy remains unchanged (Mokwena, 2009).

A second approach would be to leverage environmental laws, concepts, institutions and processes for better protection of human rights which could not be attained in the absence of a clean and healthy environment. In other words, defamations and statutory regulations which refer to “environment protection” could be used to assert protection of human rights.

The final approach could be to interface environmental law and human rights. The movement towards “sustainable development,” which considers the needs of present and future generations, seems to be heading in that direction.

The authors argue that human rights law and environmental law should continue to develop as two independent but closely linked fields whilst “borrowing” opposite concepts. For instance, in countries where a separate right to a clean environment is not formulated in clear terms, the existing human rights provisions regarding the right to life and human dignity can be invoked, on the basis that the right to decent life cannot be protected in the absence of its concomitant right to a clean environment. However, a human rights-based approach can lead to an anthropocentric approach to environment protection. Subsuming environmental law into human rights makes the environment only a function of human needs and rights rather than an issue that deserves protection in and of itself.

The National Environmental Management Act 107 of 1998 is important legislation, providing remedies for preventing or redressing acts that undermine the constitutional right to an environment that is not harmful for people’s health and well-being. It also promotes access to information and public participation in developments that affect the environment. In this process of evolution, environmental law has unleashed several novel principles such as: the participatory principle, the polluter pays principle, the precautionary principle, the inter-generational and intra-generational principles, the prevention principle, the sustainable development principle and so on.

## **THE SEPARATION OF PROPRIETY, ADMINISTRATIVE AND OPERATIONAL RIGHTS OF ECOTOURISM RESOURCES THROUGH LEGISLATION**

It is recommended that the separations of proprietary, administrative and operational rights of ecotourism resources be realized through legislation. The concept of legal pluralism refers to multiple legal rules, which are applicable in a certain jurisdiction. Legal pluralism presupposes the existence of multiple legal rules, which are recognised in a certain legal system.

Firstly, the property right of ecotourism resources belongs to individuals or to corporate. For the individually-owned part of property right which has already constituted the components of ecological landscape within attractions, the owners may be allowed to choose among alternative methods. In addition to acquisition or replacement by the state, the owners may choose such modes as evaluating in terms of money for buying shares, lease, and so on.

Secondly, the national landscape and famous sceneries are in the charge of the South African National Parks department, national forest parks national water conservancy department, tourism industry that is managed by tourism department. Managerial subjects of ecotourism activities stand in great numbers in this kind of management pattern. Authority is decentralised, resulting in massive waste of ecological administrative resources and the situation results in a chaotic management, all are managing, non-is managing, and unable to implement systematic management.

It is recommended that regulatory agency with unified authority be set up in tourism attractions, being responsible for the management of daily routine of the scenic area. Ingenious management models may be adopted, according to specific circumstances.

All kinds of profit-making business activities in ecotourism attraction such as accommodation, catering and entertainment are undertaken by various operators. The operators are administered by regulatory agencies, but they can operate independently, not subject to regulatory agencies.

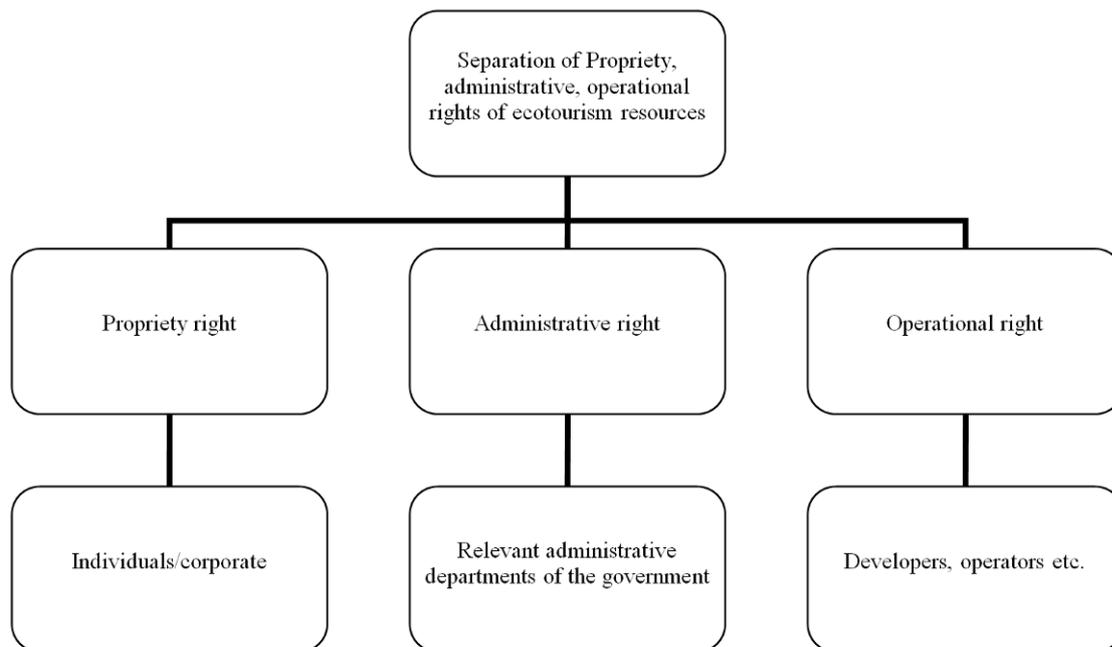

Figure 1. *Fig:1 Separation of Propriety, administrative, operational rights of ecotourism resources*

## DECISION MAKING PROCESS

There is a correlation between the number of actions achieved and the size of the municipality according to population. Municipalities that are less populous stand out for being those that mostly adopt a pro-active attitude and those that present an environmental structure. The search for governances praises local power and strengthens the mobilization capacity of the agents, which requires the awareness of the local population.

Environmental topics are increasingly more constant in the means of communication addressed to local interests and citizen's rights. The dissemination of ideas with respect to environmental conditions together with the technological revolution provides the presence of spontaneous leaderships and popular manifestation.

Governance includes the presence of legal standards so that results can be achieved, and effective control obtained. The applications of sanctions against violators has become a vital instrument and is a consequence of the construction of participative democracy. It is valid to exalt the environmental area as a significant area of participative democracy in function of the adoption of means can notice a strong presence of dwellers' associations, consolidating the role of local militants. Law becomes an essential instrument in the preservation of this order. the desired sustainability is pursued now sociability is degraded at unimaginable levels by capitalist accumulation. Environmental law is a program of studies that proposes an integration of legal knowledge into the analysis of matters related to the environment with a special emphasis on municipalities within a trans-discipline perspective.

## **TOURISM RESOURCES**

One of the main objectives of tourism is to sustain local culture and values, but also the quality of life, and must constantly deal with the changes that occur in the community life and environment. Thus, tourism development success is based on the local authorities' cooperation. Heritage is a particularly sensitive part of culture and mainly of the environment. Massive tourism constitutes an important democratization of tourism and more widely of leisure activities, in full correspondence not only to human right of pursuit of happiness but also the right to develop tourism destinations.

An increasing number of organisations are embracing environmental and sustainability challenges into their strategies and activities (Dangelico and Pontrandolfo, 2015). Integrating the environmentally friendly tasks into organisational strategies several benefits can be achieved. This include improved performance not only on organisational but also on environment relevant aspects. Organisations can implement several actions to reduce their negative impact on the environment and directly or indirectly they can improve business performance (Kabongo and Boiral, 2017).

The dynamics of tourism as an activity and as an industry, combined with the growing concerns about the environment and the effect of climate change call for a non-stop effort in seeking new approaches, tools and perspectives for the acquisition of environmental knowledge by organisations in the hospitality sector (Song, Dwyer, Li, and Cao, 2012). The need for institutional innovation and generative change in response to the sustainability imperative emphasises the necessity of organisational learning in the hospitality and tourism industry.

## **CLIMATE CHANGE AND THE IMPLICATIONS FOR TOURISM**

The phenomenon known as “climate change” refers to an ongoing trend of changes in the Earth’s weather conditions as a result of an average rise in the temperature of the earth’s surface often referred to as global warming. Climate change have become the focus of media attention as well as substantial scientific debate. Our lifestyles, economies, health and social well-being are all affected by climate change, and although the consequences of climate change will vary on a regional basis, all nations and economic sectors will have to contend with the challenges of climate change through adaptation and mitigation. Climate change may not necessarily be conducive to the interests of tourism sustainability; therefore tourism is no exception and, in the decades, ahead, climate change will become an increasingly pivotal issue affecting tourism development and management. Weather and climate have a profound influence on natural system and human societies around the world. Climate change can affect tourist experience and incorporate in travel decision process (Scott, Hall and Gössling, 2012). Weather and climate are important factors in relation to outdoor recreation and tourism. Climate change could be considered as one of the biggest problems of modern living, and the tourism is one of many sectors affected mainly through the changing faces of tourist destination. Climate change scenarios suggest that changes in seasonality and intensity of rainfall will impact the runoff and groundwater recharge and the storage of water in the soil, dams and reservoirs (Mukheibir and Ziervogel, 2006).

Water availability is a key climate change-related vulnerability and negative impacts on the availability of water will be felt by people, ecosystems and the economy. Future changes in temperatures and other important features of climate will manifest themselves differently across the regions of the world. The lessons from Cape Town, is that every city must invest today in the infrastructure and policies that will protect citizens from the future effects of our changing global climate.

The effects of climate change in South Africa are not limited to increased water scarcity in some parts of the country and drastic qualitative changes in the water supply, but extend to losses in biodiversity and rangelands, which impacts on maize farming and the agricultural sector, as well as possible increases in infectious and respiratory diseases and in the tourism industry (Kiker, 2000).

## **GLOBAL WARMING: THE LEGAL REQUIREMENT IN SOUTH AFRICA**

In March 2017 the High Court of South Africa handed down a decision that has been hailed in some quarters as a victory in the fight against dirty energy and global warming in the case of EarthLife Africa Johannesburg v Minister of Environmental affairs and Others (ZAGPPHC 58 [2017] 2 All SA 519 (GP) (8 March 2017).

*Summary of the case:*

The South Africa's High Court was recently asked to determine whether, under the National Environmental Management Act 107 of 1998, "relevant" considerations for environmental review of plans for a new 1200 MW coal-fired Thabametsi Power Projects include the project's impacts on the global climate and the impacts of a changing climate on the project. The power station is to be built by Thabametsi and is intended to be in operation until at least 2061. The court, after observing that the statute does not expressly contemplate climate change, held that such considerations are relevant and that their absence from the environmental review of the project made its approval unlawful. This question came before the court as a result of EarthLife Africa Johannesburg's appeals. The courts after observing that the statute does not expressly contemplate climate change, held that such considerations are relevant and that their absence from the environmental review of the project made its approval unlawful. The first appeal was submitted to the Minister of Environmental Affairs to challenge the adequacy of the project's environmental review; EarthLife argued that the review was invalid because it largely ignored climate change. The application for review accordingly invites determination of whether the DEA is obliged to fully assess the climate change impacts of a proposed coal-fired power station before environmental authorisation is granted in terms of NEMA. The argument of EarthLife was that a climate change impact assessment must be conducted before environmental authorisation is granted in order for the relevant decision-makers to determine firstly whether the construction of a coal-fired power station should be allowed at all.

The court cited several reasons, including South Africa's commitments under the Paris Agreement, for its conclusion that climate change is indeed a relevant consideration for the environmental review of the Thabametsi Project. Because the review approved by the minister effectively ignored climate change, the court held it to be legally invalid.

In EarthLife's appeal, it was argued that the Chief Director's decision was not lawful because no climate change impact assessment was conducted as part of the environmental impact assessment report submitted by Thabametsi Power Company (Pty)Ltd to the Chief Director for consideration. The Minister upheld the decision of the chief Director to grant environmental authorisation for the proposed Thabametsi coal-fired power station on the condition that a climate change impact assessment is conducted. When it lost that appeal, the nongovernmental organisation approached the Pretoria high court to set aside the decision as "unlawful and invalid", because the minister had granted the authorisation without a climate change assessment.

The decision in this case should serve as a call for all parties to fully consider potential impact that projects may have on South Africa's commitments to curtail global warming.

## CONCLUSION

The focus of this article was to rethink the relationship to the natural environment: sustainable tourism. The second task of this article was to establish that sustainability first assumes that human needs must indefinitely be met without jeopardizing organisms within the environment. Secondly, we must ensure and control of community while maintaining the environment that sustains them.

It is imperative to have sustainability as a primary guiding principle and conceptual framework within which to analyse the decisions taken by officials. The balancing must take place within the context of competing socio-economic conditions that influences politics, and hence the processes and outcomes of policy debate and the local and national levels of government. The need for municipalities to intensify their attempts at raising financial resources and earmarking funds for climate change programmes that are integrated with broader developmental projects.

To highlight that this would only go as to democratise the internal functioning of the state on the issues of environmental impact like climate change, rather than democratising state citizen relations on this matter. More research and implementation, however, still needs to be done to establish sustained and meaningful engagement between the state, at local level, and its citizens on climate change and the environment, although this cannot be achieved without strengthening municipal structures and systems that are intended to facilitate increased public participation more generally. The technical complexity of the environmental debate includes the climate change in and of itself is likely to mitigate against broad-based public interest and involvement in municipal debated on the subject.

Societies can respond to climate change by adapting to its impacts and by reducing greenhouse gases emissions (Scott, Hall and Gössling, 2012). The realities of global warming seem to evidence a complex and profound political issue. Tourism should be viewed as an instrument to deter global warming, but not as the goal itself. The efforts to prevent the negative greenhouse effects are not enough to enable the development of shared policies on eco-management. Continued climate-driven degradation and disruption to cultural and natural heritage will negatively affect the tourism sector, reduce the attractiveness of destinations and lessen economic opportunities for local communities; as natural and cultural resources are the foundation for the tourism sector's competitiveness.

Tourism sustainability means that we must make sure resources in an area can be preserved for use of future generations of the locals and the tourists. We must be aware of the impact that lots of visitors and tourists can have on a destination and finding ways to make that impact as positive as possible. Natural resources must always be used sparingly and only when needed because our earth and all the tourist destinations has so much to give. We must minimize these negative impacts and focusing on more positive ones, such as promoting cultural exchange and preserving local traditions. A way to achieve this goal is by getting the communities and the municipalities involved in the tourism industry.

This could also be done by as simple encouraging the sharing of local customs, or as involved as making it easier for locals to start or own new businesses to serve tourists. We had to rethink our relationship with the environment to achieve sustainable tourism in South Africa. It is also important to contextualise the potential impacts of the fourth industrial revolution on the environment an the impact on the tourism industry.

## DIGITAL INTERNATIONALISATION OF RIDE HAILING FIRMS

Van Der Krogt, Augustinus; Neubert, Michael

Universidad Paraguaya Alemana (UPA), Asuncion, Paraguay

### ABSTRACT

The paper studies the internationalisation and differentiation strategies applied by global firms operating in the shared economy and the ride-hailing sector in particular. The study adopts a multiple case-study research design based on a qualitative analysis of business strategies of seven leading global ride-hailing firms, selected on the basis of a purposive sampling method.

The research concludes that the Global Born Firm and Uppsala models are valuable as theoretical frameworks to analyse the patterns in the internationalisation strategies and concludes that three of the global ride hailing firms follow the GBF model and four firms have strategies with direct similarities with the Uppsala model. The study concludes that the Generic Strategy model can be used to identify differentiation strategies of ride-hailing service firms. Four firms apply a hybrid strategy combining a cost focus with a differentiation in service quality and customer focus, whereas three other companies focus on differentiation by addressing the particular needs of the drivers and customers. All firms seek further differentiation in terms of innovation towards new platform-based services such as delivery, fintech and alternative transport services.

The study results are directly relevant to smaller firms and newcomers from developing countries who want to compete and offer alternative options to the small number of global firms. It offers researchers a further insight in the value of internationalisation and differentiation theories in shared economy sectors such as ride-hailing services. Future academic research should focus on a sector-wide quantitative analysis of internationalisation and differentiation patterns to strengthen evidence-based application of business strategies to these services.

*Keywords: Shared economy, ride-hailing services, differentiation strategies, internationalisation strategies, generic strategies, born global firms, uppsala internationalisation model*

### INTRODUCTION

The sharing economy represents a new business model that seeks to connect consumers and business in new ways through unique digital platforms and business-to-business, business-to-consumer, consumer-to-consumer, and peer-to-peer models (Anwar, 2018). In the sharing economy individuals

and companies share services or assets are shared free or for a fee (Ossewaarde & Reijers, 2017). The sharing economy comprises various types of networked products and services including the sharing of resources such as houses, bikes and cars, redistribution of used products and different forms of collaborative financing such as crowdfunding and peer to peer lending (Anwar, 2018). The combined revenues in ride-hailing and taxi services is about US\$ 192 billion in 2020 and expected to grow with 18% on an annual basis to US\$ 365 by 2024 (Statista, 2020).

As part of the sharing economy a series of shared transport services were developed including car ride sharing among car owners and non-car owners. This evolved into a new ride-hailing service (RHS) where drivers and customers are connected through a digital service platform allowing a cost efficient real time and geographically based connection between drivers and customers. The platform based ride hailing service was first introduced by Uber in 2009. Since then over 30 ride-hailing service firms (RHF) offer similar services worldwide. In most countries two or three RHF compete with the traditional tax services. While this has resulted in improved quality and lower service costs the larger companies dominate in most markets.

In many cases newcomers and smaller firms from developing countries face high entry barriers as a result of high cost of platform development and marketing and a limited access to investment capital (Anwar, 2017). These firms also have limited resources to analyse the attractiveness of foreign markets and are dependent on their existing networks (Neubert and Van Der Krogt, 2019). These characteristics favour the position of current incumbent operators and results in limited competition and can on the longer-term decrease competition, the accessibility and quality of services.

Furthermore, despite fast growth and expansion of the market as a result of lower prices and increased customer focus, future expansion may be limited to urban middle and higher class users on the longer term (Hensley, Padhi & Salazar, 2017). This implies that we will see a market consolidation towards one or two major companies per market. Particularly in a niche market such as ride-hailing services current smaller firms and future newcomers in the ride-hailing market will need to seek effective internationalisation and differentiation strategies. With increasing globalization in the shared economy, there is a clear need for the local firms to further develop and expand their innovative products into the international markets (Neubert & Van Der Krogt, 2017, 2018).

## **LITERATURE REVIEW AND CONCEPTUAL FRAMEWORK**

### *Internationalisation theories*

Based on the research problem and the purpose, this multiple case study uses the Uppsala Internationalization Process Model (UM), the Born Global (BG) and Lean-Global Start-up Internationalization Process Model (LGS) as conceptual frameworks (Neubert, 2017).

Ride-hailing service firms (RHF) using the UM internationalize based on a market distance and market commitment establishment chain (Vahlne and Johanson, 2020). With their main firm-specific advantage, they enter new foreign markets with low cultural, administrative, geographical, and economical market entry barriers and commit resources depending on market success like for example the internationalization of Yandex in Russia and its neighboring countries and Grab in south-east Asia, or the market entry of Lyft in Canada (Neubert, 2018). This proximity contributes to the market attractiveness and influences the speed of internationalization positively due to faster learning (e.g., similar regulations and consumer behavior) and networking processes (e.g., existing networks and business opportunities) (Vahlne and Bhatti, 2019).

RHF using the BG internationalize early and fast after their incorporation on a global (= born global) or regional (= born regional) level through market-seeking activities (Neubert, 2017). Born Global RHF apply the BG after a successful development of their home market (for example: Didi in China). The case study firms of this study may be considered as Born Global RHF in the sense of digital born globals (Monaghan, Tippmann, and Coviello, 2020) The goal is often to become a regional or global market leader or a pioneer in a specific market niche. To increase the speed of internationalization, RHF using the BGM focus on the most attractive markets, regions, and often (mega-) cities with a high population density, which may be far away from their home markets as the examples of Didi's market entry to Latin America and Bolt's to Africa show.

A lean global start-up internationalization process model (LGS) is another strategic alternative for RHF to internationalize (Neubert, 2017; Rasmussen and Tanev, 2015; Blank, 2013). Based on market opportunities, RHF select and enter foreign markets, and perhaps exit them, if the market entry project fails (e.g., UBER in China or Russia). Examples of market opportunities are the possibility to acquire a national or regional ride hailing firm, a new law to liberalize the transportation industry in a country, or insufficient public transportation systems in a specific target market. The LGS model includes also the need to adapt to consumer preferences and behaviour through targeted services, which are in demand in a market, region, or city (e.g., food transportation, business clients).

#### *Differentiation theory: Generic Strategies*

For the purpose of this paper, Michael Porter's Generic Strategies model is used to explain the difference in business strategies between global ride-hailing firms (Porter, 1985). The model is also applicable to the shared economy services such as RHF (Kim, Nam and Stampert, 2004). To be able to survive in the highly competitive platform-based services, companies will need a very clear competitive strategy (Firoz, Rashidirad & Firoz, 2019).

Within these kinds of markets, companies can focus on cost leadership thanks to the limited operational costs and elevated economics of scale that platform-based companies can achieve in service

operations, marketing and the possibilities to gather and analyse large volumes of customer information services. Competition with traditional taxi services is based on the limited required investment in assets as the RHF do not incur costs of buying the medallion or license, fleet of cars, hiring drivers and maintaining the vehicles allowing technology-driven start-up to enter the market previously dominated by traditional incumbents and gain the market share (Harding, Kandlikar & Gulati, 2015). Alternatively, companies can exploit a differentiation strategy to outcompete their competitors by offering improved service quality, a clear focus on customer needs, and efforts to build branding at global levels. In the particular case of the ride hailing sector, Porter's innovation strategies represent a key differentiation factor that is relates to platform based innovation strategies that allow to expand into new shared economy services and markets such as transport, logistics, fintech, and other sectors (Hales & Mclarney, 2017).

Yet, while there are extensive opportunities in favour of a cost leadership strategy a cost focus alone may not be a sufficient strategy because these competitive advantages also apply to the competitors. Therefore, research suggest that companies need to combine both a cost focus benefiting from the opportunities of low-asset services and cost effective platform based services and seek distinctive and continuously new differentiation strategies to be successful (Kim, Nam and Stampert, 2004; Firoz, Rashidirad & Firoz, 2019). This can be considered as an adapted business strategy based on a hybrid of cost leadership and differentiation rather than a stuck in the middle strategy as suggested by Porter (Hales & Mclarney 2017).

Table 1: Adapted Generic Strategies model for ride-hailing services

|                   |   |  |   |
|-------------------|---|--|---|

## RESEARCH METHODOLOGY AND RESEARCH QUESTIONS

The key research questions of the research are:

1. What internationalisation patterns follow the leading global ride-hailing firms?
2. What differentiation strategies are applied by the leading global ride-hailing firms?

Most studies on ride hailing services apply a case study approach on one particular company or seek to compare two companies. The individual case study method allows for an in-depth description and understanding of the background and foundations of firm strategies but limits the possibility to identify generic business models and sector-wide patterns in business strategies in the ride-hailing industry (Anwar, 2017; Kosintceva, 2016). Therefore, this study applies a multiple case-study research design that allows to find linkages between business strategy theories and patterns in company strategies in the ride-hailing sector. The current business theories and perspective can be enhanced by multiple-case studies that recollect and systematically analyze empirical data to answer qualitative research questions to connect to new types of products and services such as those operating in the shared economy (Halkias & Neubert, 2020). The multiple-case study design allows for a more flexible analysis of patterns across the different case studies of the sample (Yin, 2018; Neubert, 2018).

As part of the research methodology, the company selection considered a purposive sampling method in which the research team uses its judgment when choosing members of the population to participate in the study (Suri, 2011; Neubert, 2017). This sampling method is widely used to identify information-rich cases in a cost-effective and time-effective way (Merriam and Tisdell, 2019). This sampling method is particularly applicable to the analysis of innovative practices as found in the case of service that are based on technology platforms connecting users and providers as offered by the shared economy (Palinkas, Horwitz and Green et al., 2015). For this study, the seven largest global ride-hailing companies were studied and all have developed a combined business strategy based on internationalisation and differentiation of its services. These companies have all started operations between 2010 and 2013, allowing for sufficient information and data collection to deduct business strategy patterns.

Data was collected in May and June 2020 using different sources of evidence like for example scientific academic articles and corporate documents (annual reports and strategy papers), reports from consultants, journalists, and investors. Regarding the selection of the cases studied, the cases should have things in common when employing the multicase technique on research (Stake, 2006). Data analysis started with a with-in case analysis using a thematic analysis based on codes developed through a triangulation of the different sources of evidence, followed by a cross-case analysis to identify common themes and patterns (Halkias & Neubert, 2020).

## RESEARCH FINDINGS

The case studies include Uber with headquarters in the USA as the largest RHF with services in 900 cities in 80 countries and increasingly differentiated service offering ([www.uber.com](http://www.uber.com)). Although Lyft only operates in the USA and Canada, it is among the largest operators and main competitor to Uber

in the USA with services in 649 cities ([www.lyft.com](http://www.lyft.com)). Russian based Yandex.Taxi is a technology company leading in ride-sharing services in Eastern Europe and active in 1,000 cities in 18 countries ([www.taxi.yandex.com](http://www.taxi.yandex.com)). Chinese company Didi Xuxing is leading in China and now active in 11 countries with operations in 400 cities ([didiglobal.com](http://didiglobal.com)). Grab is the leading RHF in South East Asia, born in Malaysia and later based in Singapore with services in eight countries and 235 cities ([www.grab.com](http://www.grab.com)). The biggest company from India Ola Cabs operates in more than 250 cities in four countries including India, Australia, New Zealand and recently acquired a licence in the UK ([www.olacabs.com](http://www.olacabs.com)). The leading company in Africa is Bolt with services in 150 cities in 35 countries across Europe, Africa, and Asia ([blog.bolt.eu/en](http://blog.bolt.eu/en)).

*Answers to research question 1: Internationalisation patterns of leading ride-hailing firms*

The multiple case study revealed two-fold patterns in internationalisation with three of the firms, Uber, Didi Chuxing and Bolt following an internationalisation strategy based on BGM (see table 2). After its start in 2011 in the USA, Uber followed directly an exponential global expanding strategy representing a clear case of a BGM strategy (Kosintceva, 2016). Didi started with fast expansion in the vast market in China and once established expanded its services at a fast pace since 2018 with new operations in Asia and Latin America. In a similar way, Bolt initiated its operations as a regional born company in Eastern Europe in 2013 but already in 2016 became a BGM ventured into Latin America, Africa and Western Europe. Yandex can also be categorized as a BGM as it seeks regional expansion but in a very fast pace growth into more distant Western European and African markets in its second year of its foundation.

Lyft, Grab and Yandex show patterns based on UM whereby the company seeks a slower expansion model towards markets with similar cultural, social and economic characteristics (see table 2). Lyft seeks to expand from larger into smaller cities in the same USA and took five years to seek its first foreign venture into the neighbouring and similar Canadian market and is expected to seek its next expansion into Mexico, where it can build on its experience in the US-based Latino markets. Grab has followed the UM strategy through a much slower annual and regional expansion into two or three countries South-East Asia. The case of Ola Cabs is still less clear in terms of its internationalisation strategy (Panigrahi, Shahi & Rathore, 2018). Similar to Lyft and Didi the company focused since its start in 2010 for a longer period on establishing a strong position in its large Indian home market. In 2018, however it decided to explore more distant foreign markets in Australia, New Zealand and the United Kingdom.

Answer to research question 2: Differentiation strategies of leading ride-hailing firms

Despite the similarities of the basic platform-based services provided, the differentiation strategies of the seven global companies studied vary considerably. Uber's strategy is primarily focused on cost leadership using the low asset costs and economies of scale of shared platforms that characterize ride-hailing services (see table 3). The highly efficient and scalable technology platform of Uber, lower participation in revenue sharing of drivers to be the sector's cost leader in developed countries. Using first mover advantages in most markets, cost leadership was applied to new markets to outcompete traditional taxi services and in markets with platform-based competitors the company undercuts market prices to gain a fast and dominant market share particularly in up-market segments. Cost leadership is combined with convenience, comfort and cost savings in transport services and a strong global branding strategy to capture large market shares, thereby representing an example of a hybrid business strategy (Anwar, 2018; Hales & Mclarney 2017).

Table 3: Differentiation strategies of leading global ride-hailing firms

| Company | Cost focus | Differentiation focus |                |          |                           |
|---------|------------|-----------------------|----------------|----------|---------------------------|
|         |            | Service quality       | Customer focus | Branding | Platform-based innovation |
| Uber    | x          | x                     |                | x        | x                         |
| Didi    |            | x                     | x              | x        | x                         |
| Yandex  |            |                       | x              | x        | x                         |
| Bolt    |            | x                     |                | x        | x                         |
| Ola     | x          |                       | x              | x        | x                         |
| Lyft    | x          | x                     |                | x        | x                         |
| Grab    | x          |                       | x              | x        | x                         |

Source: Elaborated by the authors

Four companies including Grab, Ola.cabs, Didi Chuxing and Yandex.taxi have chosen primarily a strong customer focus. Grab and Ola Cabs have sought to enhance services accessibility by lower-income customer segments in their developing markets by introducing lower-priced, transparent and efficient motorbike and hatchback services in large congested urban cities (Tam, Lam, Chiu et al, 2018; Panigrahi, Shahi & Rathore, 2018). The cost focus allows these RHF to compete with Uber on price and customer needs and the lower market segments. Didi Chuxing and Yandex.taxi focus on customer needs through the innovation in the effectiveness of ride-hailing services using big data, augmented

reality and artificial intelligence to optimize navigation and by introducing localized services such as group ride-sharing services along preset roads in overcrowded cities (Wirtz & Tang, 2016).

Three companies specifically seek improved quality in a very different way by enhancing their partnership including a transparent and better revenue sharing with drivers. With drivers being the main intermediaries between the platforms and customers this strategy can enhance the service quality. Lyft combines a competition on costs and lower prices and active branding with the binding of its drivers by transparent revenue sharing models, the acquisition of cars and subsidized fuel prices for their drivers which results in a steady increase in the market share in the USA up to 40% in 2020 (Wirtz and Lovelock 2016). Rather than disrupting the traditional taxi market, Didi Chuxing and Bolt has developed a service that allows integrated solutions for traditional taxi companies which has allowed the company to gain a leading position in Eastern Europe and Africa (Wirtz and Lovelock, 2016).

Aligned with the nature of the sector, the ride-hailing companies seek innovation as a differentiator but with interesting differences. Most companies aim to exploit their technology platform to offer improved and new services to their current customer base. To address its lower customer segments, Ola Cabs sets a priority to the development and introduction of less ambitious innovation in its services focusing on electric cars (Panigrahi, Kumar, Shambhavi et al, 2018). To a lesser extent, the advanced technology platform operated by Grab also facilitates differentiation of services including integrated delivery and fintech services through its technology platform (Tam, Lam, Chiu et al, 2018). Didi is a clear market leader in platform-based innovation which allows for a fast optimization of current services and integration of new big-data and artificial intelligence driven services such as voice activated digital assistants, delivery, reservation and fintech services and self-driving cars (Wirtz & Lovelock, 2016). In a similar way, Uber seeks new leading high-end market positions and profitability by entering fully new services and markets as a newcomer including delivery services, self-driving cars and future large scale aerial passenger transport (Uber, 2016). It is also seeking to be a first comer in advanced business to business platform-based services in the transport and logistics sector.

## DISCUSSION

This study confirms the assumption that multiple-case studies can provide a better understanding of the relationship between business strategy theory and empirical data and analysis to find actual patterns in firm strategies in the shared economy as suggested by recent research by Halkias (Halkias & Neubert, 2020). Challenges to future scholarly research are found in a deepening of the multiple-case study with a more robust quantitative recollection of firm data and statistical analysis and the

inclusion of a larger number of companies active in the ride-hailing sector to gain a broader and more in depth understanding of patterns in business strategies of larger and smaller players from developed and less developed countries and in the sector.

The paper provides a further insight into the applicability of internationalisation models UM, BG, and LGS, and Generic Strategies apply to software and platform based service providers such as ride hailing service as suggested by other authors (Neubert and Van der Krogt, 2017, 2018, 2019). The findings indicate that the UM and BGM models together do represent an effective theoretical framework to understand and identify the different internationalisation patterns of the ride-hailing companies.

The findings also confirm that the Generic Strategies model is also of value if it considers the particularities of the role of platform based innovation which strongly amplifies the possible differentiation strategies of the RHF as suggested by research by Kim (Kim, Nam and Stampert, 2004) and Firoz (Firoz, Rashidirad & Firoz, 2019). Furthermore, the study confirms the assumption of authors such as Hales and that, to be successful in shared platform services as ride hailing services, firms need to apply a hybrid business strategy of cost leadership and differentiation (Hales & Mclarney 2017). However, further research is needed to develop a more distinctive set of differentiation strategies which allows for a better analysis and comparison of business strategies in the complex and fast developing ride-hailing services industry.

## CONCLUSIONS

This paper responds to the call and need to analyse in a more systematic research on the business strategies of leading ride-hailing incumbent companies and to seek increased alignment of strategies with current theoretical business strategy models. A better understanding of patterns in business strategies of incumbent firms can assist smaller operators and newcomers in expanding and surviving in a highly competitive market that is dominated by a small number of global players.

The multi-case study of the seven-leading global RHF shows in response to the first research that global companies follow two different internationalisation strategies. Three of the companies follow a fast BM strategy and four companies a strategy following the Uppsala model which seeks a slower and solid national expansion of services and a later regionally-based foreign expansion.

Responding to the second research question, the RHF have distinctive differentiation strategies. Uber focuses on a hybrid strategy based on global cost leadership combined with high quality services. Four companies seek as a primary strategy to optimize the customer experience by catering to lower income customers in developing markets or by using advanced digital technology to optimize navigation and payment services. Three firms focus on service quality by improving their partnerships with drivers as

a key intermediary between platform-based services and the customer. In line with the nature of the shared economy, all RHF use platform-based innovation to expand to a more lesser extent into new services for their current customer base such as delivery and fintech services and venture into new markets in the transport and logistics sector.

These results provide smaller operators and newcomers in the market of ride-hailing services with relevant business strategy options to choose from when seeking to expand service in their home markets and to select internationalisation into foreign markets. It also provides an initial set of qualitative findings on internationalisation and differentiation strategies. This multiple case-study research design has several limitations in scope and size that offer new ideas for additional research. Future scholarly work should also include more quantitative and sector-wide analysis of internationalisation and differentiation patterns of a larger number of RHF in the sector.

<sup>3</sup> University of Reims, Reims, France

### ABSTRACT

The financing of cultural policy is underdeveloped research issue in Slovak cities; even though the historical and cultural heritage is very rich and extraordinary. The paper explores the topic on the example of selected Slovak cities – Košice, Banská Bystrica, Banská Štiavnica. Each of the city represents a different “kind” of city – Košice is a creative and culture city established on the great success of European Capital of Culture (ECC), Banská Štiavnica is a city with a worldwide known historical and cultural UNESCO heritage and Banská Bystrica was a centre of important events in forming Slovak history, but now only with the average level of local cultural development. The main idea of the paper is to compare the role of culture financing as a potential driver of local cultural development and characterise differences between cities.

*Keywords: Culture. City. Financing. Development.*

### INTRODUCTION

The local culture is an important part of heritage, significant source of local identity, education, historical knowledge and patriotism of citizens. It is a mean of building tolerance, cohesiveness and understanding between ethnic and religious groups. The development of culture and the protection of the cultural heritage at the local level can be a key driver of local development.

The paper deals with the issue of financing of culture by the local municipality, on the example of selected Slovak cities – Košice, Banská Bystrica, Banská Štiavnica. Each of the city represents a different “kind” of city – Košice is a creative and culture city established on the great success of European Capital of Culture (ECC), Banská Štiavnica is a city with a worldwide known historical and cultural UNESCO heritage and Banská Bystrica was a centre of important events in forming Slovak history, but now only with the average level of local cultural development.

The main idea of the paper is to compare the role of culture financing as a potential driver of local cultural development and characterise differences between cities. The first part of the paper explains the institutional and strategical framework of the local cultural policy in the Slovak Republic. The

second part defines the methodology and data used. The third part analyses the selected indicators of the financing of cultural policy in the mentioned cities and compare them from the cultural importance point of view for the local development. To conclude the paper, we point out the main challenges in financing of culture at the local level and utilization of culture as a driving force of local development.

## **CULTURAL POLICY IN THE SLOVAK REPUBLIC AT THE LOCAL LEVEL FROM THE INSTITUTIONAL AND STRATEGICAL POINT OF VIEW**

Local culture is the smallest geographical-territorial component of culture. It represents an essential feature of culture, the self-expression of the local population, its contribution to regional and national culture. It includes cultural expressions and activities (cultural products, cultural processes and their cultivation) and cultural peculiarity and peculiarity, its degree and level of participation by the local community in cultural life and creation in its environment.

The culture and cultural heritage of each municipality should co-create a sense of home, security, but also increase the attractiveness of the territory for residents, local businesses, visitors of the territory and potential investors. Support of local cultural activities, cultural life and a detail knowledge of the cultural resources of the territory become a competitive advantage, a strength and a sign of the development of municipalities.

In the Slovak Republic, the public institutional basis for the development of local culture consists mainly of municipal museums, galleries, libraries, theatres and music institutions, art ensembles, cultural-educational facilities including observatories and planetariums, as well as the relevant specialized workplaces of the Center for Folk Art Production, Matica slovenská, Slovak Academy of Sciences and public universities. In the paper we pay attention to the cultural services delivered by the local authority. Namely, the competences of local municipality in the field of culture are regulated by Act no. 369/1990 Coll. on Municipal Establishment as amended and other laws (Constitution of the Slovak Republic, Act of the National Council of the Slovak Republic no. 309/2014 Coll., amending and supplementing act of the National Council of the Slovak Republic no. 539/2008 Coll., on support regional development). They include:

- the establishment of municipal and school libraries, educational centers and educational facilities, museums, galleries and theatres,
- creation of conditions for cultural and edification activities (within the framework of edification activities, artistic, cultural-educational and cultural-social activities, education and leisure-time activities),

- regulations of zoning and responsibility for planning documentation of settlement units and zones; conception of development of individual areas of community development, especially in the form of program of economic and social development of municipality,
- ensuring the construction, maintenance and management of public spaces, cultural facilities and cultural heritage owned by the municipality,
- creating conditions for the protection of the heritage fund and heritage areas in the municipality,
- recording the municipal chronicle,
- compilation of lists of monuments of the municipality.

To the largest share of competencies of local municipalities belong mainly establishing and managing libraries, galleries, museums and theatres. The figure 1 shows the share of cultural institutions in the competence of local municipalities on the total number of selected cultural institutions in the SR.

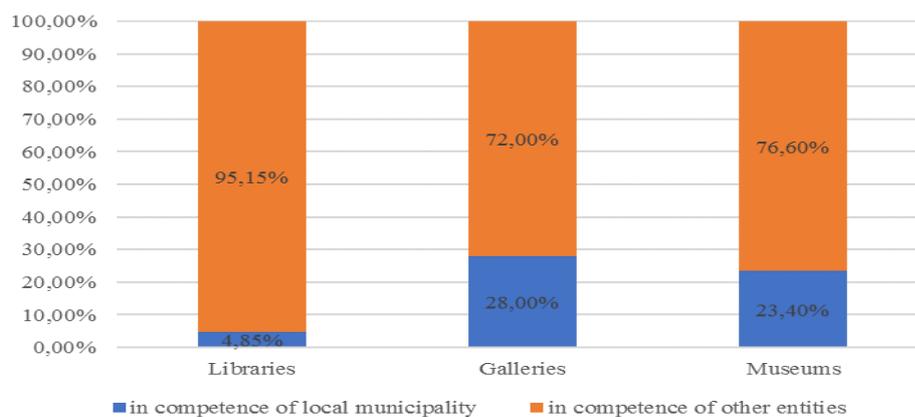

Figure 1: *Cultural institutions in the Slovak Republic*

The offer of public cultural institutions is complemented by non-governmental organizations, professional associations, collectives and individuals in the field of cultural-educational activities and non-professional artistic creation, folk art producers, registered churches and religious societies, engaged/active chroniclers, teachers, volunteers, academics, etc.

The local authority as a founder of cultural institutions administers all agenda related to the financial, managerial and organisational relationships with the established institutions. Depending on the size of the municipality these tasks can be realised by the separate department specialised on culture or can be added to the scope of work to other departments related to this topic, e.g. tourism. As an advisory and facultative body for the municipal council in the field of culture can established the commission for culture. It provides the professional feedback for the planned, as well as, organised activities in the cultural development, selects the local private and non-profit projects in culture that should be supported by donations or realised in cooperation with the city.

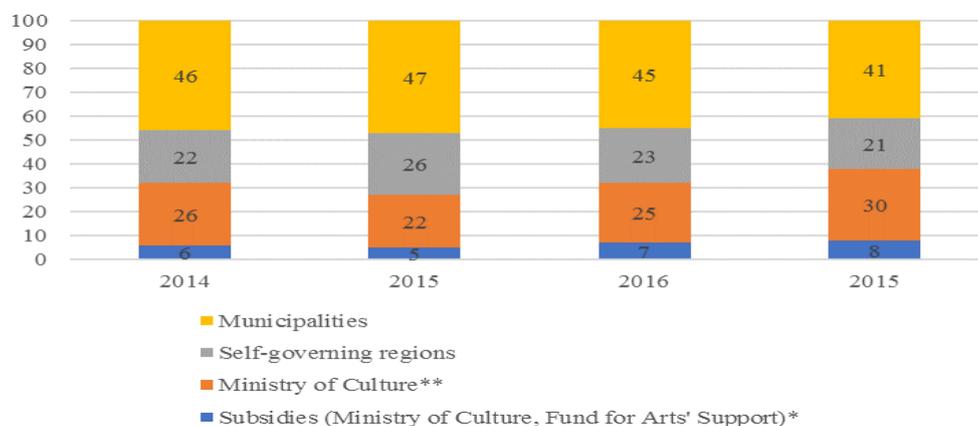

Local authorities cooperate with central state administration bodies (especially the Ministry of Culture), other state administration bodies (e.g. monument offices) and authorities of higher territorial units in fulfilling their competences in the field of culture.

From the strategical point of view, the cultural development is usually planned as a part of Economic and Social Development Plan (an official obligatory strategical document of municipalities with more than 2 000 inhabitants). Municipalities do not have the official obligation to prepare a separate policy paper focused on culture and its development. Nevertheless, approximately 50 municipalities of the total number of 2927 municipalities in Slovakia have prepared such a document, of which the vast majority are district towns.

In Slovakia, as in many other countries, public budgets are the key sources of culture funding. The largest part of local government expenditure on culture are transfers to budgetary and contributory organizations providing cultural services (e.g. local museums, galleries, libraries etc.). Other important source of financing cultural services are the subsidies provided for the specific aims directly to the established entities by the local municipality. The umbrella of subsidies mechanism is a Fund for the art support administered by the Ministry of Culture of the Slovak Republic.

The other expenses of local municipalities in culture include financing of cultural events organised or co-organised by the municipality; expenses on maintenance of cultural objects owned by the local municipality; expenditure on the protection and revitalization of the cultural heritage managed by the city and contributions to the cultural activities of natural and legal persons, including citizens' initiatives, in the form of grants.

Although, the total budget of local and regional authorities represents only about 16% of the total public budget, local and regional governments are an important player in terms of culture funding, as about 40% of public expenditures on culture come from local and regional governments. In total, municipalities spend about 3.75 % of their budget on culture (in 2018). Of the public expenditures of state budget on culture with a direct impact on the regions and towns, the largest share is represented by municipal budget expenditure - accounting for almost 50% of total expenditure (figure 2).

\* selected programs with a direct impact on regions

\*\* only expenditure with impact on regions included (excluding institutions with nationwide scope)

Figure 2: *Volume of culture expenditure from public sources with a regional and local impact (EUR million) and the ratio of these expenditures.*

The ability to finance the cultural activities and their extend depends on the municipality's own resources. That is why very important is a multi-source financing, e.g. subsidies from the Fund of Arts' Support, program Let's renew our house, European structural funds and European Commission programs (e. g. Creative Europe 2014-2020 Program, Europe for Citizens Program 2014-2020, INTERREG VC Central Europe 2020 Program, Program INTERREG VA Slovak Republic – Austria, Integrated Regional Operational Program (IROP) 2014-2020), subsidies from the budget chapter of the Office of the Government of the Slovak Republic; Rural Development Program 2014-2020 of the Ministry of Agriculture (Rural Tourism) and various grant schemas from the foundations or private companies.

## DATA AND METHODOLOGY

The research of cultural policy financing in the Slovak Republic is underdeveloped at national, regional and at local level. In the paper, we try to cover one of the gaps in this research and we pay attention especially to the local level of financing cultural services and explore the differences in three Slovak cities - Košice, Banská Bystrica, Banská Štiavnica.

Each city is specific. Košice is a real creative and culture city established on the great success of European Capital of Culture. Banská Štiavnica is rich of historical and cultural UNESCO heritage. Banská Bystrica is a city associated with many historical milestones important for the forming Slovak history, but the current level of local cultural policy is based mainly on the activities of volunteers and non-profit organisations, the support from the local municipality is low in comparison to other Slovak cities. Table 1 below show the main characteristics of the cities in order to compare their potential and projects for cultural, economic, sport and natural resources.

| City / District | Inhabit. City / District | Cultural resources  | Natural resources   | Labels / Projects   |
|-----------------|--------------------------|---|---|---|
| Košice          | 239,000/<br>390,000      | Medieval / Renaissance centre<br>Army and industry wastelands re-used for cultural sector<br>Steel and digital industries<br>Lots of cultural institutions and associations<br>Important hockey team and other sports<br>Marathon | National park close by<br>Wine and natural Unesco sites tourism nearby<br>Tokaj wine close by | European Capital of Culture (ECoC) in 2013<br>Unesco Creative City label for media art<br>Unesco sites close by, including Tokaj wine<br>Project : Continuing ECoC progress |

|                  |                    |  |   |  |
|------------------|--------------------|--|---|--|
| Banská Bystrica  | 76,600/<br>122,200 | Medieval/Renaissance city centre<br>Lots of cultural institutions and associations<br>Industries and services<br>Higher education<br>Cultural, sport and thermal tourism | Unesco and mining sites nearby,<br>Hron river, parks<br>mountain national park nearby                           | National city park<br>Project: Unesco label for a hammer mill                            |
| Banská Štiavnica | 10,100/<br>16,600  | Medieval/Renaissance Technical monuments (silver mine to visit)<br>Lots of cultural and digital activities<br>Higher education   | Countryside and lakes (artificial)<br>Rural and industrial tourism<br>Agriculture, forestry and mining industry | Unesco label for the city and around<br>Risk of too many tourists (around 60 000 / year) |

Table 1 *Main characteristics of the selected cities*

The research has been based on review of secondary data - statistics, urban reports, strategic development programmes of municipalities, accounting reports of the cities as well as on primary data that were collected during the study visits in each city by interviews with the representatives of cultural and creative industries and representatives of municipalities.

## CULTURE POLICY AND ITS FINANCING IN THE SELECTED SLOVAK CITIES

### *Košice*

Košice is the second biggest city of Slovakia, situated in the eastern part of the country, only 20 km from Hungary, 80 km from Ukraine and 90 km from Poland. The city is an administrative centre of the Košice Region (NUTS 3 level) divided into four districts. The city of Košice covers an area of 243.7 km<sup>2</sup>, with 239,141 inhabitants. Population density is 1008.9 persons per km<sup>2</sup>. Košice is a seat of many public administration offices including local authorities, state administration offices and consulates. A network of banking and financial institutions, universities, research and development institutes, administrative and cultural facilities, hospitals and other services have been built in Košice.

Košice is an old city with a rich culture and historical heritage. St. Elizabeth's church, with its landmark dome is the easternmost Gothic cathedral in Europe. The city's historical centre is the largest urban heritage reservoir in the country from 1983 (Main street). Some of the most famous monuments are St. Elizabeth's Cathedral, St. Michal's Chapel, St. Urban's tower, the State Theatre, the Levoča House, Andrassy's Palace and the Immaculata Statue (The Plague Column).

Košice includes 791 register of lesser national cultural monuments. It contains various kinds of monuments as churches, castles, city fortification, bourgeois houses, monasteries, calvary, cemeteries, brewery, flat houses, barracks, factories, university building, etc. The largest group of monuments is presented by the burgher houses (270 items, 34% of all monuments), it is followed by houses (123 items), cemeteries (58 items), city fortification (23 items), calvary (17 items). By the prevailing style

that are, the most abundant among the monuments are classicism (17.83%), eclecticism (15.04%) and renaissance (11.63%). The municipality is an owner of 97 monuments (12.3% of total number). All monuments are protected by the special rules defined by the state and is why the process of their reconstruction as well as exploitation can be protracted.

The importance of monuments in Košice for tourism is strongly associated with the presence of 10 of the 15 Slovak cultural sites listed by UNESCO in the region or close regions, including the old wooden churches, Spiš castle (the largest castle in the middle Europe), Bardejov city, famous wine region Tokaj, extraordinary caves and primeval forests.

Košice presents a good example of a city that systematically maps and exploits cultural potential in its development. In 2013 Košice was the European Capital of Culture in cooperation with French city Marseille. From 2017 Košice is a member of UNESCO Creative Cities Network in field of media art and announced as a UNESCO Creative City of Media Arts in 2018. (<http://www.cike.sk/sk/novinka/481-kosice-ziskali-miesto-v-sieti-kreativnych-miest-unesco-co-to-znamena-pre-mesto>; cit. 15. 10. 2018). In 2016 Košice became the European City of Sport. In 2019, Košice was a European City of Volunteering. In 2011 and in 2019 Košice hosted the Ice Hockey World Championship with Bratislava. In 2017, Košice was included in the Creative Cities Monitor 2017.

The financial support of cultural and creative development in Košice is mainly the responsibility of the City of Košice. The funds for this purpose are incorporated into the program of municipal budget - The city of culture and sport and are presented in table 2.

| Expenses for the program - The city of culture and sport |                       |                       | Year on year change   |                       |
|--|-----------------------|-----------------------|-----------------------|-----------------------|
| Year   | Real current expenses | Real capital expenses | Real current expenses | Real capital expenses |
| 2014   | 5 182 035,00 €        | 651 276,00 €          |                       |                       |
| 2015   | 5 256 921,00 €        | 1 432 078,00 €        | 1,45%                 | 119,89%               |
| 2016   | 5 742 013,00 €        | 3 890 690,00 €        | 9,23%                 | 171,68%               |
| 2017   | 5 778 795,00 €        | 816 665,00 €          | 0,64%                 | -79,01%               |
| 2018   | 6 329 653,00 €        | 1 028 536 €           | 9,53%                 | 25,94%                |
| 2019<br>(Approved Budget)                                | 7 862 700,00 €        | 1 962 000,00 €        | 22,81%                | 101,38%               |
| 2020 (Plan)  | 11 701 000,00 €       | 5 858 000,00 €        | 48,82%                | 198,57%               |
| 2021 (Plan)  | 11 861 000,00 €       | 5 670 000,00 €        | 1,37%                 | -3,21%                |

Table 2 Expenses for the program - The city of culture and sport 2014 – 2021 (municipal budgets of Košice city)

Table 2 shows that the current expenses for the development of culture and sport in the city have increased during the whole researched period. The development of capital expenses fluctuates. In the planned budget for 2019-2021 was included the organisation of European Youth Olympic Festival in 2021, but the City of Košice refused to organise this event (it will be in Banská Bystrica). Probably, the

financial plan for 2019 and 2020, which is positive with higher investments in cultural and sport facilities, will not be fulfilled.

For the deeper analysis we present the structure of cultural expenses in 2018 (last available data), selected from the whole program The city of culture and sport, in table 3.

| Type of expenses  | Current expenses |                       |                 | Capital expenses |                       |                 |
|---|------------------|-----------------------|-----------------|------------------|-----------------------|-----------------|
|   | Approved budget  | Reality to 31.12.2018 | % of fulfilment | Approved budget  | Reality to 31.12.2018 | % of fulfilment |
| Subprograms of culture  |                  |                       |                 |                  |                       |                 |
| Support system of cultural development (grants and events calendar)                               | 237 200,00       | 233 800,00            | 98,6            | -                | -                     | 0               |
| Creative industry Košice, n. o. (operation of non-profit organisation)                            | 320 000,00       | 320 000,00            | 100             | -                | -                     | 0               |
| Cultural events (e.g. Košice day; Summer in Košice, cultural events in premises of ECC 2013, etc. | 209 033,00       | 195 140,00            | 93,4            | 20 000,00        | 18 102,00             | 90,5            |
| Event oriented at spiritual development (Festival of sacral arts)                                 | 15 000,00        | 14 839,00             | 98,9            | -                | -                     | 0               |
| Supporting activities in historical heritage (Reconstruction of monuments)                        | 42 850,00        | 39 597,00             | 92,4            | 227 150,00       | 88 712,00             | 39,1            |
| Support of culture infrastructure (ZOO Košice, Košice cultural centres, library)                  | 4 223 900,00     | 4 223 900,00          | 100             | 421 000,00       | 342 091,00            | 81,3            |
| Total   | 5 047 983,00     | 5 027 276,00          | 97,22           | 668 150,00       | 448 905,00            | 35,15           |

Table 3 Structure of cultural expenses in Košice city in 2018 (Final account of the city Košice in 2018)

In the structure of cultural expenses has a significant position the subprogram – Support of cultural infrastructure (84 % of the cultural budget). A great part of the cultural infrastructure was built during the preparation process for the ECC or during the year of governing in 2013 and because of the continuity of the project activities all created cultural premises are permanently maintained and used for the cultural events. The important position has also a non-profit organisation Creative Košice, which is a main actor in exploitation of creative and cultural potential in the city. Other kinds of expenses include the cultural events and maintenance of the monuments. The budget for the culture is one of the highest from the Slovak cities, but it is only 3.15 % of the whole budget of Košice city in 2018.

#### *Banská Štiavnica*

The town of Banská Štiavnica, the oldest mining town in Slovakia, was established in the 13th century, although evidence of mining dates to the late Bronze Age. The property's distinct form was created by the symbiosis of the industrial landscape and the urban environment resulting from its mineral wealth

and consequent prosperity. Banská Štiavnica, located in Central Slovakia, sits in the middle of a caldera. The town is located in the southern part of Central Slovakia in the protected landscape area Štiavnické vrchy. Banská Štiavnica is situated about 170 km northeast of Bratislava (access by expressway D1 / R1), 45 km southwest of Banská Bystrica and 160 km north of Budapest.

The town is constructed on a site of mineral exploitation. Its layout adapted to its difficult topography. The urban fabric is densest in the valley, around Trinity Square, and opens up towards the edges. The houses, mostly belonging to miners, are constructed on different levels and spaced out along the streets.

The town is an exceptional example of a medieval mining centre of major economic importance that pursued its mining activities until the Modern period and adopted a distinctive and characteristic form. With the end of the mining activities and the relocation of the Mining Academy, this city lost much of its *raison d'être* and as a result has become very vulnerable. The town has no preconditions for the emergence of large-scale industry, and houses are under a preservation order. After 1990, many factories had been closed one by one. At present, there are only small and medium sized enterprises but tourism together with the fact that its *genius loci* attracting creative people, have a huge potential.

The Historic Town of Banská Štiavnica and the Technical Monuments in its Vicinity is an outstanding example of an important mining settlement that has developed since the Middle Ages. The property's distinct form was created by the symbiosis of the industrial landscape and the urban environment resulting from its mineral wealth and consequent prosperity. Since 11. December 1993 Banská Štiavnica has been a UNESCO World Cultural Heritage site under the name: **Historic Town of Banská Štiavnica and the Technical Monuments in its Vicinity.**

Banská Štiavnica's historic architecture and engineering works have been well-preserved. There are 360 sites of historical art in the centre of the town – urban reservation area, 304 of which are registered as national cultural monuments. They include various kinds of monuments as churches, castles, bourgeois houses, miner's houses, monasteries, calvary, factories, university building, etc. Almost half of the monuments presented the bourgeois houses (151 items). The baroque style is the most prevailing with (88 objects – 29%), followed by the renaissance style (89 objects - 29%). More than 40 per cent of monuments are in the hand of citizens, 32% of monuments are owned by the public sector – state and local government.

Among historical monuments extensive complex of technical works, connected with mining and processing of polymetallic ores, can be found in the town and in its vicinity. Surviving components include shafts, tunnels, mining towers, a knocking tower, and a sophisticated water management system. The system of artificially built water reservoirs – ponds and collecting ditches – built in the

16th century and developed in the 18th century, served the needs of the mining industry and provided fresh drinking water for the town. It was the most modern work of its type until the 19th century. After this time, the exhaustion of mineral resources has led to decline in the historic urban structure, the water management system, and much of the mining infrastructure.

There are several standard and other cultural and creative institutions in Banská Štiavnica. The standard/municipal institutions include, in particular, Municipal Cultural Centre, Cinema Akademik and Municipal Library. The City Cultural Centre has an important meeting function, its premises are mainly used by third sector organizations for cultural and social activities. Akademik cinema is one of the most visited cultural buildings. Thanks to the stability of the projection offerings, visitors can choose from a wide range of different genres and titles. Beside its main activity, the library regularly prepares and co-organizes different events. In 2018, there was in total 93 events, of which 65 were educational (especially for children and youth) and 28 were cultural and social events.

The municipality itself acts as a coordinator and supporter of many events through its specialized departments and their action plans. Cultural and creativity services are provided year-round or seasonally (especially in summer) by the municipality in partnership with the private and non-profit sectors. A distinctive policy of the municipality in recent years is to attract and engage more domestic people into the activities they have carried out and to transfer the town's history to the present days through non-traditional activities focusing on children and youth (various exhibitions, competitions, theatre performances). Traditional and sought-after events include Living Chess, Forgotten Crafts and Salamander Days, which end the cultural summer in Banská Štiavnica.

The town's budget is not big one with expenditure reaching 9 462 938 euros in 2018. Within the program Culture the spent budget was 335 774 € (Table 4). However, support and direct funding for culture and creative activities is hidden also in other sub-programs such as Promotion and marketing, Citizen services, Education, etc.

| Type of subsidies  | Grants (Reality to 31.12.2018) | Capital grants (Reality to 31.12.2018) |
|--|--------------------------------|--|
| Subsidies and grants from Ministry of Culture            | 140 083,00                     | -                                      |
| Subsidies from Fund for Arts Support                     | 134 106,00                     | -                                      |
| Subsidies from Higher Territorial Unit                   | 3 960,00                       | -                                      |
| Subsidies from the Office of Government                  | 45 104,00                      | -                                      |

| Total  | 335 774,00 |

Table 4 *Grants and expenditures in program Culture (Final account of Banská Štiavnica municipality 2018)*

The table 4 presents that Banská Štiavnica is able to cover all costs for the cultural activities from grants. It is influenced by the localisation of the UNESCO heritage in the city, as well as gained subsidy for the preparation and realisation of project – Capital of Culture supported by the Fund for Arts Support. The share of cultural expenses on the whole budget of Banská Štiavnica is 35.61 %. The structure of the cultural expenses is very similar to Košice.

#### *Banská Bystrica*

Banská Bystrica is the sixth largest city in Slovakia, the regional capital and the cultural and economic center of central Slovakia. Banská Bystrica is situated in the northwest of the Banská Bystrica Region, in the Zvolenska Lowland, in the valley of the river Hron, between the Kremnické and Starohorské Mountains and Polana. The city of Banská Bystrica is also known as the "City under the Urpin". Urpin with a height of 510 m above sea level is in the catastral area of Banská Bystrica, near the center. The city has 42 offices and various institutions of regional and district importance. Due to its central location, the city is the seat of some institutions with nation-wide competencies, such as the Financial Administration of the Slovak Republic, Slovak Post, Industrial Property Office of the Slovak Republic, Slovak Environment Agency, State Nature Conservancy of the Slovak Republic, Forests Slovakia. Most economically active inhabitants work in public administration, defense and in the education, retail and health sectors, that is, in the services sector. The renewed historical center, new modern construction and beautiful surrounding countryside offer a wide range of opportunities for sports, hiking and recreation.

According to the Monuments Board of the Slovak Republic, in the city of Banská Bystrica are 336 monuments. The city of Banská Bystrica was one of the first cities in Slovakia, declared in 1955 as an urban conservation area. Part of the urban conservation area is the city castle of Barbakan, the square SNP with the churches of Our Lady and St. Cross, the Old Town Hall, Matej's house and the remains of the city fortifications, the Marian Column and the leaning clock tower. The square is bordered by opulent burgher houses and churches with historical value. The SNP Memorial with the surrounding area was declared a national cultural monument in 1982. The culture of the city is completed by its architecture and other sacral and technical monuments. In the Tihanyi mansion in Radvaň, there are exhibitions of the natural science department of the Central Slovak Museum. The historical museums are in Thurzo's House on SNP Square and Mathew House. Rare artworks are preserved in three State

Galleries. In the city is situated 160 historical monuments and almost one third is in hands of the municipality (45 monuments).

The city is supposed to have over 100 historical events. In 2018, there were 178 events, including traditional events, in front of 123,408 spectators. The most important cultural event in Banská Bystrica, based on traditions and folk culture, is the Radvan Fair. It is included in the representative list of intangible cultural heritage of Slovakia and this year will be held 363rd year. Part of Radvanský Fair is a traditional craft market, wide range of fairy-tale gastronomic specialties and in recent years an ancient market that is reminiscent of the appearance of Radvanski's yoke in the past.

Culture in Banská Bystrica is financed from three sources - the local budget, the BBSK budget and the state budget through the Ministry of Culture of the Slovak Republic. Because we aim at the financing of culture from the municipal budget, the table 5 provides an overview of the expenditures on the culture from the local authority.

| Culture     | Reality |         |         | Budget (plan) |         |         |
|-------------|---------|---------|---------|---------------|---------|---------|
|             | 2016    | 2017    | 2018    | 2019          | 2020    | 2021    |
| Expenditure |         |         |         |               |         |         |
| Current     | 423 348 | 425 993 | 491 721 | 568 482       | 543 881 | 543 881 |
| Capital     | 5 956   | 27 916  | 374 016 | 185 000       | 0       | 0       |

| Program Culture in 2018  | Current expenses | % of fulfilment | Capital expenses | % of fulfilment |
|--|------------------|-----------------|------------------|-----------------|
| Cultural heritage and traditions (cultural summer, Radvan Fair, Christmas) | 228 964,00       | 93,62           | -                | -               |
| Cultural events  | 107 342,00       | 86,61           | -                | -               |
| Reconstruction and maintenance of monuments                                | 42 255,00        | 87,46           | 374 016,00       | 88,78           |
| Grant system for the cultural support (including municipal theater)        | 113 160,00       | 99,26           | -                | -               |

Table 5 Culture expenditure in Banská Bystrica in Euro (Program budget of Banská Bystrica for years 2019 – 2021, 2018)

The highest share of current expenses is dedicated to the cultural events (traditional and new ones). There absent the expenses for the cultural infrastructure, what is caused by the fact that there are no cultural premises in hands of city. The "Worker House" (the place for cultural events) currently used for the cultural events is administered and managed separately from the cultural budget till 2019 because its financing from the European structural funds. The cultural expenses create only 0.85 % of the whole budget.

To compare the financing of culture in the researched cities we elaborate table 6. In the table 6 it is evident that for the cultural development is crucial to build and maintain the cultural infrastructure. In case – Košice and Banská Štiavnica the high share of funds belongs to this category of expenses. It is a hard infrastructure that is necessary to realise the soft cultural activities – cultural events. In Banska Bystrica, the role of city as key actor in cultural development is transferred to the non-profit and

private organisations by providing grants and subsidies. The lowest share of funds for reconstruction of monuments is in Košice, even the municipality owns two times more monuments as Banská Bystrica. The capital expenses for culture were reported only in Košice and Banská Bystrica.

| City             | Expenses         |         | Grant support of culture | Cultural infrastructure | Cultural, spiritual events | Reconstruction of monuments | Total        |
|------------------|------------------|---------|--------------------------|-------------------------|----------------------------|-----------------------------|--------------|
| Košice           | current expenses | in Euro | 233 800,00               | 4 543 900,00            | 209 979,00                 | 39 567,00                   | 5 027 246,00 |
|                  |                  | in %    | 4,65%                    | 90,39%                  | 4,18%                      | 0,79%                       | 100,00%      |
|                  | capital expenses | in Euro | -                        | 342 091,00              | 18 102,00                  | 88 712,00                   | 448 905,00   |
|                  |                  | in %    | 0,00%                    | 76,21%                  | 4,03%                      | 19,76%                      | 100,00%      |
| Banská Štiavnica | current expenses | in Euro | 4 750,00                 | 133 074,00              | 134 035,00                 | 63 915,00                   | 335 774,00   |
|                  |                  | in %    | 1,41%                    | 39,63%                  | 39,92%                     | 19,04%                      | 100,00%      |
| Banská Bystrica  | current expenses | in Euro | 113 160,00               | 0                       | 336 306,00                 | 42 255,00                   | 491 721,00   |
|                  |                  | in %    | 23,01%                   | 0,00%                   | 68,39%                     | 8,59%                       | 100,00%      |
|                  | capital expenses | in Euro | 0                        | 0                       | 0                          | 374 016,00                  | 374 016,00   |
|                  |                  | in %    | 0                        | 0                       | 0                          | 100,00%                     | 100,00%      |

Table 6 Comparison of cultural expenses in selected cities in Košice, Banská Štiavnica and Banská Bystrica

## CONCLUSIONS

The system of financing culture by the local municipalities depends strongly on their financial capacity. The development of culture belongs to the municipal original competences, so there are no transfers from higher administration level. However, there are numerous possibilities to gain additional funds from the national and regional grant schemas and subsidies system, European structural funds or programs of European Commission, but also from private grant schemas financed by successful enterprises.

The main idea of the paper was to compare the role of culture financing as a potential driver of local cultural development and characterise differences between cities. Referring to research results, Banská Štiavnica provides the high amount of funds for culture in ratio to the total budget of the city. Moreover, the city is able to cover all cultural expenses from the subsidies and grants. Košice is a city that spent the highest share of cultural expenses for maintenance and development of cultural infrastructure. It is caused also by need to realise these activities as obligation raised from the ECC. The lowest interest in cultural development was confirmed in Banská Bystrica. Although, the city has a great cultural and creative potential, there absents some strategical and financial support of culture development. This is declared also by ambition of representatives of Banská Bystrica to organise the European Youth Olympic Festival in 2022 instead of Košice, so the strategical role started to play sport.

The research helps us identify also the main challenge in financing of culture at the local level. Because the fact that the financing culture is an original competence of the city, it is on the city representatives' decision if and how intensive support of culture is implemented. If the city includes some exceptional potential (UNESCO heritage, ECC, quality and diversified offer in culture etc.), there is much higher interest in the potential exploitation from the economic and social reasons (Sotiriadis, 2017). On the other hand, the culture of the city can be a source of competitive advantage(s) in any city as well as main factor of attracting the new inhabitants, investors and entrepreneurs, what confirms a lot of international researches (Hansen, Niedomysl, 2008; Martin-Brelot, Grossetti, Eckert, Gritsai, Kovács, 2010; Argent, Tonts, Jones, Holmes, 2013; Faggian, Comunian, Cher Li, 2014; Khodabandehloo, 2014). So, we recommend to the Slovak cities to realize the cultural policy based on the deep analysis of cultural and creative potential and to identify the possibilities of its exploitation as one of the key or partial development strategies. If the culture can become a driver of local development, the local government should support it – financially, strategically as well as politically, not only in limited way as is usual in Slovak cities. Moreover, the success of the development depends on the quality management and skilled experts involved (case of Košice and Banská Štiavnica) in all stages, including the ability to achieve funds from various additional sources.

# **SOCIAL MEDIA AND INTERNATIONAL MARKETING: A SYSTEMATIC REVIEW**

**Wut, Tai Ming; Wong, Shun-mun Helen**

School of Professional Education and Executive Development, The Hong Kong Polytechnic University,  
HKSAR

## **ABSTRACT**

There is an increasing trend of research papers in social media and international marketing. Authors reviewed 22 articles between 2012 and 2020. The findings show that recent research has focused on three research themes: Use of social media in social networking; social media and branding; and social media advertising. Academics are advised to address under-research fields. Five possible further research areas in the social media and international marketing are proposed: factors affecting the use of social media marketing, mechanism between international brand and user through social media; cultural factors in the use of social media marketing; consequences of social media marketing and new analytic methods. This review paper fills a literature gap in the research on reviewing social media practices in international marketing.

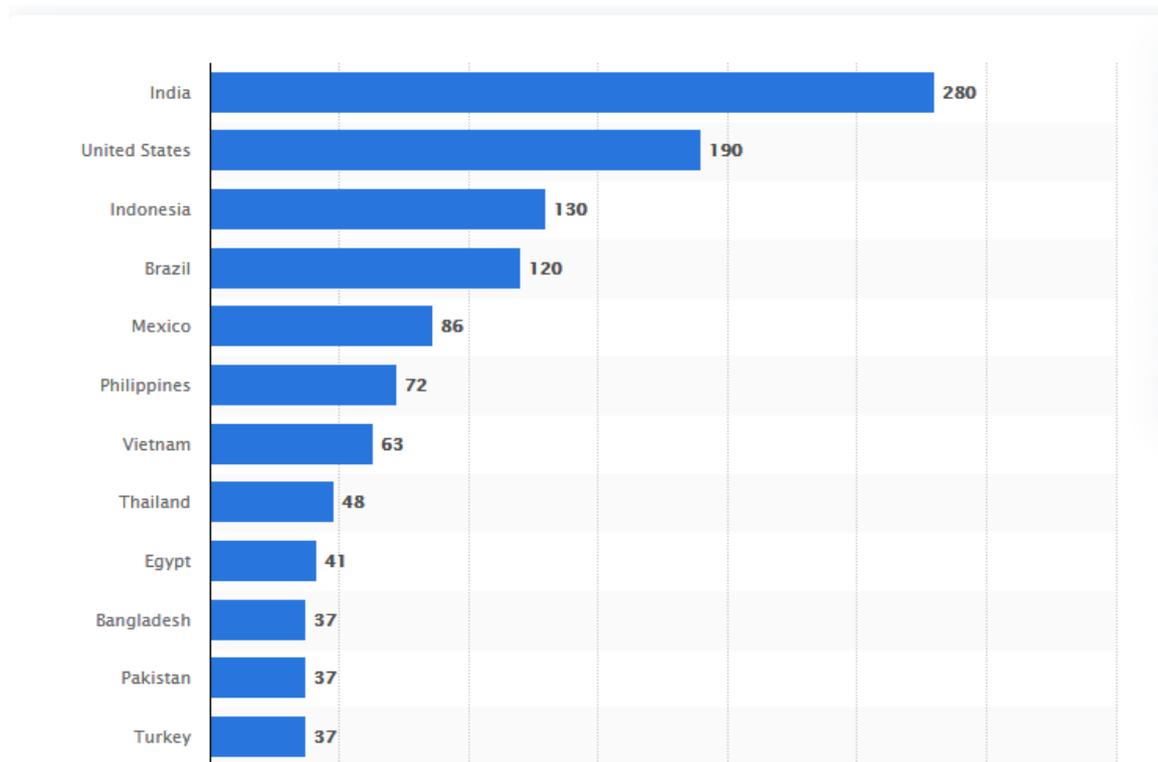

*Keywords:* Social media; international marketing, systematic review

*We declare that there is no potential conflict of interest*

## **INTRODUCTION**

The objective of this paper is to examine the past research trend related to social media and international marketing and suggest future research area directions.

The use of Social media is always an agenda for almost every business today worldwide (Kaplan and Haenlein, 2010). Social media is defined as “a group of internet-based applications that build on the ideological and technological foundations of Web 2.0, and that allow the creation and exchange of User-Generated Content” (Kaplan and Haenlein, 2010, 61). Facebook has become the leading social media tool over the world and it has 2.5 billion monthly active users as of December 2019 (Statista, 2019). Youtube is the first runner-up with more than 1 million active user and Instagram is the second runner-up with more than 600 million users (Hanlon, 2019). India has 280 billion Facebook users, followed by United States, 190 million (Figure 1) (Statista, 2020). As such, today marketers would use social media to reach their target audience globally. We synthesis past papers, address emerging issues and provide future research areas.

**Figure 1** Users of Facebook worldwide (Source: Statista, 2020)

Digital media is a media that can be read by a computer or machines. The most prominent use of digital media is undoubtedly social media. Social media is defined in Merriam Webster Online Dictionary (2004) as “forms of electronic communication through which users create online communities to share information, ideas, personal messages, and other content”. In the age of Web 2.0, reduced costs for online data storage enable the creation of user-generated spaces with diverse set of opportunities for the construction of virtual social networks. (Obar & Wildman, 2015) In the Digital 2020 report written by a global advertising agency, up to January 2020, there are 3.8 billion active social media users, which made up 49% of the world’s total population. (We Are Social, 2020) Over one-third of the time people spent online is on using social media. Social media provide multi-national companies with opportunities to start conversation with global audience, and even organize online promotional activities, gone viral world widely through social media under celebrity endorsement. (Kwon, 2019) Apart from the influence of celebrities and key opinion leaders, successful social media campaigns usually based on authentic stories, and engagement works on reciprocity principle, in which participants can earn public praise for their participation (Weiner, 2019).

Interactivity is defined as "a media’s potential ability to let the user exert an influence on the content and/or form of the mediated communication" (Jensen, 1998, p. 201), which is affected by the direction of the communication, and the degree of control users had on the exchange. The design of social media sites are inherently interactive, which allow users either to interact with content provided by

other users, or to interact via the creation of their own content. There are three types of uses as categorized by Guo and Saxton (2014), among 750 tweets randomly collected from 188 American advocacy organizations, almost 69% of are in the category of "information" in form of one-way communication; almost 20% of the randomly selected tweets were "community" type messages, these messages were partially interactive which facilitated the creation of an online community; the remaining nearly 12% of tweets were "action" focused, meaning that they were messages that attempted to get followers to "do something", therefore they are highly interactive (Guo & Saxton, 2014).

Social media platforms carry different features, for example, Twitter limits each tweet to 280 characters (Gligorić et al., 2018), Instagram is image- oriented (Carrasco-Polaino et al., 2018), YouTube focus on videos (Arthurs et al., 2018), while Facebook incorporate functions of several. The number of reactions available for audience also varies, such as different emoticons of like, love, sad, wow, angry, funny and other themed clicks on Facebook (Hutchinson, 2020); like and dislike for YouTube (Shoufan & Mohamed, 2017); and a heart icon for Twitter and Instagram (Gorrell & Bontcheva, 2016). Most platforms enable the use of hashtag (#) to increase visibility when users are looking for information of related keywords (Scott, 2018), so that the content posted can receive higher engagement.

Sheth (2020) points out international marketing strategies might need to be modified based on the effect of social media. He proposes a typology of international marketing that global-micro context is a backdrop of social media in world business (Sheth, 2020). It is a good time to look back what we have gone so far and look ahead future research directions.

#### *Media Richness Theory*

The richer the media, the more effective it is. It offers an explanation why social media sites containing images and videos rather than text in order to have richer information (Daft and Lengel, 1986).

This study asks the following questions:

- 1) What are the main research themes in social media and international marketing?
- 2) What is the future research agenda regarding social media practices in international marketing?

## **METHODOLOGY**

This systematic literature review should be consisted of three steps: a) identification of articles, (b) selection and description of the sample and (c) systematic analytical work (Mialon & McCambridge, 2018).

All articles from 2010-2020 in five major journals of the related theme namely Journal of International Marketing, Journal of World Business, International Business Review, International Marketing Review, and Global Strategy Journal were screened, with 4 articles were identified relevant (Table 1).

The starting year 2009 is chosen because social media officially started around year 2008 and research coming out a few years later. A comprehensive literature search will be carried out using six combinations of keywords: international marketing and social media; international marketing and digital media; global marketing and social media; global marketing and digital media; global market and social media; global market and digital media. The keywords combinations are chosen in order to cover more articles first for initial review. To conduct the search, four databases, ProQuest, Science Direct, Scopus, and Business Source Complete were used. Filters were applied in these databases to only peer-reviewed articles, in academic journals published in English.

**Table 1 Papers on Major Journals (Source: authors)**

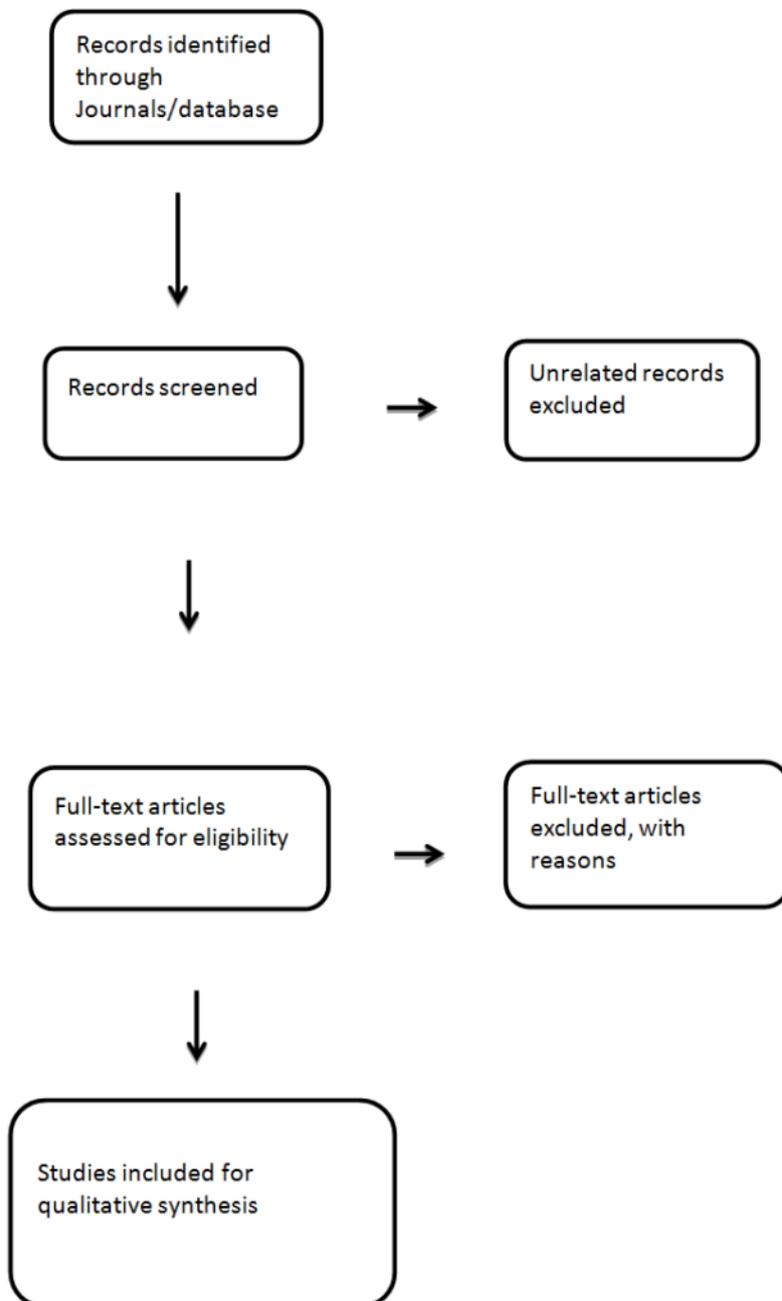

|    | Major Journals                     | Relevant | Duplicated | New Entries | Date of Search |
|----|------------------------------------|----------|------------|-------------|----------------|
| 11 | Journal of International Marketing | 3        | 0          | 3           | 7/7/2020       |
| 22 | Journal of World Business          | 0        | 0          | 0           | 7/7/2020       |
| 33 | International Business Review      | 0        | 0          | 0           | 7/7/2020       |
| 44 | International Marketing Review     | 1        | 0          | 1           | 7/7/2020       |
| 55 | Global Strategy Journal            | 0        | 0          | 0           | 7/7/2020       |

The review was conducted during the period of 7-21 July 2020. A total of 116 articles published within 2009 to 2020 were collected, as social media is a new topic that emerged in around the past decade. The numbers of results yielded, relevant articles, duplication, new entries and exact date of search are recorded (Table 2). In the coming research process, results will first be screened based on titles, abstracts, and keywords, for ambiguous cases, the researcher read the full text to decide eligibility. Reviewers will look for the places where the targeted keywords were mentioned throughout particular articles to see whether it fits the selection criteria of international/ global study targeting more than one country either intra or inter continent, and discussed social media marketing. Papers which only vaguely mentioned the targeted keywords, citations or author biographies should be ruled out. PDF files of all the selected text will be downloaded for later checking and further reference. If there is a dispute between two researchers, discussion between coder are encouraged to resolve the discrepancy (Krippendorff, 2013). A third researcher shall be invited to join the assessment and final decision is made based on the discussion among the team members. The whole process is presented in figure 2.

## DISCUSSION

### RESEARCH THEMES

I propose a typology of the current research themes listed as follows (Figure 3):

**Figure 3 Research themes**

|   |   |
|---|---|
| Macro context   | Micro context   |
| Antecedents and consequences of digital media marketing         |   |
| International Business<br>Crisis Management<br>Cultural factors | Promotional tool<br>Relationship tool<br>Consumer behaviour (e-WOM)<br>Branding |

(Source: authors)

There are three existing research themes: Use of social media in social networking; social media and branding; and social media advertising. They have a common idea is that social media is a tool that could be useful in international marketing. The existing research themes are biased on the micro side of the story.

#### *Social Networking*

Social media firstly used as a personal social media platform to connect friends. Companies are increasing use social media in commercial use to maintain customer relationship (Gao et al., 2018). Social networking is an important activity in international trade (Puthusserry et al., 2018). It contributes to get updated international market and customer information. Social networking activities in form of social media context might be a part of corporate Social capital (Ryan et al., 2019; Mulvery et al., 2019).

#### *Social Media advertising*

Social media is used as a promotional tool. Kim et al. (2018) investigate an effect of social media campaign on brand popularity. Johnson et al. (2018) examines behavioural implications of social media advertising. In order to be success in social media advertising, network capability, image transferability and personal extensibility are important factors (Okazaki and Taylor, 2013). The use of social media in emerging markets represents the global-micro context (Sheth, 2020; Oyedele abd Firat, 2020). Electronic word of mouth and opinion leadership are interrelated to international marketing advertising (Sheth, 2020; Akdevelioglu and Kara, 2020). Nowadays, social media marketing strategies is a dominant promotion strategy (Haneef and Ansari, 2019). Social media becomes a norm in international marketing strategy (Berthon et al., 2012). Some studies on the use of social media of political leaders (Peres et al., 2020).

#### *Branding and digital media*

Social networking sites have association with global customer culture. Global brands develop its ecosystem to entertain their customers (Ozsomer, 2019). It might through social media postings which should be attractive, customized and interactive (Lin et al., 2017). At the end, the global brand could

achieve certain level of brand popularity (Kim et al., 2019). There is an effect of social value (through social media participation) on brand equity. It is stronger for Chinese customer (Jiao et al., 2018).

## **FUTURE RESEARCH AGENDA**

There are seven emerging research fields on social media and international marketing.

### *Cultural factors*

Is there any impact on cultural factors of social media advertising usage? (Alshboul et al., 2019) Individualism/collectivism and masculinity/femininity dimensions are possible moderating factors.

### *Consequences of digital media marketing*

The consequences of social media advertising could be trust, customer commitment, sales performance, brand loyalty and brand awareness (Mahmoud et al., 2020).

### *New analytic methods*

Previous research has relied on traditional methodologies such as content analysis and structural equational modelling. Researchers could consider analysing images and/or pictures (emoji) in addition to the responses in survey.

### *Digital media and international marketing strategies*

Mahmoud et al. (2020) explore a relationship between social media resources and export importance.

### *Digital media crisis*

Companies face a lot of risks concerning customer privacy and customer data linkage.

### *Factors affecting the use of digital media marketing*

Knowledge of the competition, brand awareness, customer's preferences and cultural measures are possible factors affecting the use of social media advertising (Eid et al., 2020). Mediating factor is attitude toward social media advertising. Moderating factors are credibility and infotainment (Johnston et al., 2018).

### *Linkage of international brand and user*

Digital media is used in the process of creating linkage between brand and individual customer (Gao et al., 2018). What is the underlying mechanism?

## **CONCLUSION**

This study is only a preliminary attempt to address this topic. However, it has successfully answered the two research questions. There are three existing research themes: Use of social media in social networking; social media and branding; and social media advertising. More theoretical support is needed. There are seven suggested future research themes: factors affecting the use of digital media marketing, mechanism between international brand and user through digital media; cultural factors in

the use of digital media marketing; digital media and international marketing strategies; consequences of digital media marketing, digital media crisis and new analytic methods.

## **BOOK OF CONFERENCE ABSTRACTS**

# THE IMPACT OF PERSONAL CHARACTERISTICS ON THE CONSUMER CHOICE BETWEEN DONATION TO CHARITY AND PURCHASE OF CAUSE-RELATED PRODUCT

Adomaviciute, Karina; Kirse, Sigita; Purmalyte, Ieva

Marketing department, Vilnius University, Vilnius, Lithuania

## ABSTRACT

Charity support behaviour is widely appreciated in modern societies. The interest in this topic is also encouraged by charity organizations which are constantly looking for ways of attracting more support for their sponsored charity types and projects. However, attracting donors' attention to charity projects requires knowledge of their personal characteristics. Numerous authors agree that personal characteristics have the major influence on general consumer attitudes, which in turn determines their involvement in charitable activities (Bennet, 2003; Proenca and Pereira, 2008).

Prior studies suggest, that altruism, hedonism and materialism are influencing donors' charitable intentions (Adomaviciute *et al.*, 2016; Andreoni *et al.*, 2015; Goldsmith and Clark, 2012; Subrahmanyam, 2004; Bennett, 2003; Strahilevitz and Meyers, 1998), however only altruism has received wider attention in research. The critical question is whether the personal characteristics (hedonism, altruism and materialism) differently impacts the most analysed types of charity related behaviour: direct donation to charity and purchase of cause – related product. Previous studies did not analyse this relationship.

The objective of this study is to investigate how donors' personal characteristics (hedonism, altruism and materialism) are influencing consumer choice between intention to donate to charity and intention to purchase cause-related product. The study included two steps: a pilot study and the main quantitative study. Online survey and non-probability (convenience) sampling were used for the main study. This study is based on a survey of 211 respondents from Lithuania.

Research results confirmed the positive impact of altruism on the intention to donate to charity as well as purchase of cause-related product. However, this relationship was stronger in the case of direct donation to charity. The positive impact of hedonism was confirmed only for the intention to purchase cause-related product. The impact of materialism was not confirmed.

The analysis enriches a scientific knowledge gap in the consumer choice between donation to charity and purchasing cause-related product. Most researches analyse only one of behavioural cases, that is: which factors determine either the donation to charity, or consumer intention to purchase cause-related product, though the two behaviours include certain similarities. This study provides new

insights into the knowledge about similarity between the donation to charity and purchasing cause-related products, confirming the importance of altruism in both instances.

The contribution towards charitable donations, including cause-related marketing, management is that there are specific person-based variables to consider when designing campaigns.

The limitation of this study is the scope (one country based) of the sample, which does not allow broad generalizations. Therefore, it is recommended for the future research to test and compare the results of the proposed research model in other countries.

*Keywords: altruism, cause-related product, charity, donation, hedonism, materialism.*

## FOREIGN EXPERIENCE IN WASTE MANAGEMENT

**Agapkin, Alexander Matveevich; Murtuzalieva, Svetlana Yu.; Murtuzaliev, Sergey S.**

Plekhanov Russian University of Economics

### ABSTRACT

It is proposed to use in our country a modern method of landfill disposal using the natural bioreactor method, which is implemented in ecologically oriented countries such as the USA, Sweden, Great Britain, France and Italy. Domestic engineering and technology, the level of design and construction business are quite sufficient to successfully implement the creation of bioreactor landfills and manage their work. An action plan for the implementation of the pilot project is presented, which can provide a solution to acute environmental and land problems caused by previously created and newly created landfills in various regions of the country in a short time and at low cost.

### 1. INTRODUCTION

The modern approach to waste management is focused, among other things, on their complete (ideally) processing (utilization) without burial at landfills [1-6]. In some foreign countries (in particular, in Sweden) this approach has already been implemented to a large extent. But, in most countries, including even ecologically oriented ones such as Great Britain, France, Italy, the prevailing share of municipal waste (including its organic part) still continues to be directed to landfill [4].

In Russia, the problem of preventing further growth of landfills and reducing environmental damage from previously created landfills is one of the urgent tasks of state policy [1]. Naturally, the process of transition to the complete processing of banned waste disposal, reduction and elimination of landfills takes time. In the transition period, in addition to reducing the volume of waste newly arriving at the disposal site, the task arises of eliminating environmental damage from previously created landfills and finding a solution for their subsequent utilization (elimination or use as an environmentally friendly element of the terrain).

Russian landfills can be made environmentally friendly and inexpensive by turning them into controlled aerobic bioreactors. It is known that the conservation of a dump (landfill) is associated with large one-time costs, and the maintenance of a mothballed dump (under the conditions of continued activity of anaerobic microorganisms) requires significant annual expenditures as long as the landfill remains a source of harmful emissions and environmental pollution, i.e. throughout the life cycle of this object.

At the same time, the landfill can be turned into a natural bioreactor, eliminating the source of environmental problems and avoiding significant costs. In such a bioreactor dump, specially selected

associations of aerobic bacteria introduced into her body in a relatively short period can carry out biological "cleaning" of the entire landfill array, not only processing all the organics into microbial fertilizers, but also removing contaminants from hydrocarbons and other harmful contaminants, and also eliminating pathogenic microflora. It is only necessary to create dumps in the entire body volume that are optimal for the life of beneficial bacteria, humid air and temperature conditions and replace "bad" microorganisms with them. Humidity-air control is achieved by means of a network of wells for feeding into the body of the landfill and distributing in it the amount of air (oxygen) and moisture necessary for aerobic bacteria, as well as by selecting the filtrate at the base of the landfill for its cleaning (using natural sorbents) and reusing purified liquid.

## **2. LANDFILL BIOREACTOR IN PRACTICE**

This idea of a landfill bioreactor was put to practical use in the United States [7,8], where in the early 2000s, with the support of the US Environmental Protection Agency (EPA), several landfills in several states were turned into bioreactors and, as a result of the operation of such bioreactors, positive results proven by instrumental measurements and analyzes, including:

- the methane yield, previously (before the air was fed into the landfill body) produced by anaerobic bacteria, was sharply reduced and reached the usual levels in the air;
- accordingly, the problem of methane emissions, risks of fires and fires was eliminated;
- eliminated fetid odors;
- the filtrate has become much cleaner;
- the volume of the landfill has decreased;
- the composition and characteristics of the material contained in the body of the landfill have changed for the better, the material has ceased to be dangerous.

### **2.1 Advantages of Bioreactor landfills**

Bioreactor pilot landfills cost about \$ 29 per ton of landfill material (about \$ 2 million per landfill of about 70 thousand tons), while the effect of reducing landfill costs was \$ 150 per ton due to cost reduction on leachate cleaning, fire prevention, charges for emissions and pollution of groundwater and air, other costs for maintaining the landfill while reducing the term of the "active" state of the landfill from more than 30 to 3-5 years. Due to the simplicity of the process, the limited number of equipment used and the enormous unit capacity of the "landfill bioreactor", such a bioreactor looks like the cheapest way to dispose of waste in comparison with any other.

In the USA, bioreactor dumps have become a new long-term trend in waste management supported by the US Environmental Protection Agency (EPA), since such bioreactors stabilize the dump in a

short time, turn its environmentally hazardous content into inert and often useful materials, which can either be utilized with the release of the previously occupied landfill for a new landfill, or the vacated and reclaimed land can be used for other purposes for hail constructional, agricultural needs, afforestation and other environmentally friendly purposes. In the US, there are plans to expand the number of landfill bioreactors. Research continues on the impact of bioreactors on the environment and the improvement of technology.

The domestic level of biotechnological studies of microbial biotransformation of organic waste is not inferior, and in a number of areas it surpasses the world one. Domestic engineering and technology, the level of design and construction business are quite sufficient to, based on the results of specialized microbiological studies, successfully create bioreactor dumps and manage their work.

The task of modeling the heat-mass transfer regimes of a bioreactor, selecting an association of useful aerobic microbes, substantiating technical solutions and choosing equipment requires a multidisciplinary team of performers.

It is advisable to start with the implementation of a pilot project of a "landfill bioreactor" with the subsequent implementation of a large-scale program to transfer Russian landfills to an inactive (not dangerous for the environment) state and their subsequent complete or partial elimination, and, if necessary, use of the vacated land for reuse as a new landfill or for other beneficial uses with economic benefits.

## **2.2 Action plan for pilot project**

The proposed action plan for the implementation of the pilot project could include:

Preparatory stage.

- selection of an object for a pilot project with the definition of the goals and objectives of the project in the context of the post-project use of the site currently occupied by the landfill;
- the task of modeling the heat-mass transfer regimes of a bioreactor, selecting an association of useful aerobic microbes, substantiating technical solutions and choosing equipment requires a multidisciplinary team of performers.
- selection of bacterial associations for biological destruction of the organic components of landfill material, removal of heavy metals and other contaminants, suppression of pathogenic microflora, substantiation of requirements for air-humidity and temperature conditions to ensure maximum activity of bacteria;
- three-dimensional modeling of heat and mass transfer processes in the volume of a bioreactor dump;
- definition of a network of wells and distribution pipelines for uniform supply of air and moisture throughout the volume of the bioreactor dump, as well as a drainage system for collecting and removing leachate, cleaning it and returning it to the process;

- substantiation of the main technical solutions of a landfill-bioreactor with a task to carry out design work;
- preparation of the financial model of the project;
- preparation of a business plan for the project;
- preparation of draft administrative and regulatory documents for the launch of the project.

Stage of construction of a landfill bioreactor:

- implementation of design work;
- ordering and supply / leasing of equipment;
- performance of drilling and construction works;
- commissioning;
- the formation and training of operating personnel;
- conclusion of the bioreactor to the design mode.

Stage of operation of the landfill bioreactor:

- maintenance by operating personnel of the bioreactor operating mode established by the technological regulations;
- biotechnological support of the bioreactor;
- environmental monitoring of the state of the landfill in comparison with its predicted parameters in a state without being transferred to the bioreactor mode, as well as in comparison with an analogue object not transferred to the bioreactor mode;
- collection and analysis of information on the temperature, humidity and air conditions of the landfill bioreactor, bacterial activity, the introduction, if necessary, of refinements and changes to the operating conditions and their parameters.

Stage of landfill liquidation after bioreactor shutdown:

- dismantling of wells, pipelines, equipment;
- sectional excavation of biodegradable material, its separation into fractions and products, including the isolation of components that require possible additional processing or disposal;
- the use of useful components of the processed material as soil, technical soil;
- Reclamation of the cleared land for permitted new use.

Stage of summing up the results of the pilot project and making decisions regarding the distribution of proven technology to new facilities

- report on the completed project;
- conclusion of independent experts;
- patenting technology to protect national scientific and technical documentation;
- preparation of a program for the distribution of proven technology to other facilities.

- adoption of government decisions at the regional and national levels to stimulate the use of the Moscow Region experience in transferring landfills to bioreactor mode.
- obtaining significant environmental and economic benefits at the national, regional levels.

### 3. CONCLUSION

The above proposal to transfer landfills to an environmentally friendly state of the bioreactor is able to provide a solution to acute environmental and land problems caused by previously created and newly created landfills in various regions of the country in a short time and at low cost.

*Keywords: landfill, bioreactor, aerobic microorganisms, organic waste, recycling, environment.*

### ABSTRACT

### SYNOPSIS OF THE CENTRAL THESIS

In this paper, the authors aimed at presenting theoretical advancements and empirical evidence of the impact of the International Entrepreneurial Orientation (IEO) and international experience (IE) on the international performance (IP) in a turbulent and uncertain environment by borrowing theoretical elements from the behavioral theory of the firm and entrepreneurship literature, and by testing hypotheses on a sample of Tunisian SMEs specialized in ICT and operating in Africa. Tunisia has developed a national strategic plan "Tunisie Digitale 2020" (2014-2020), which mainly aims to develop the various electronic services in order to make the knowledge industry competitive, especially at the international level (Rapport TIC en Tunisie, DG Trésor, 2016). Indeed, the ICT sector is considered as a priority in Tunisia as it employs approximately 9% of the workforce and represents 7% of the GDP. This leads researchers to evaluate this situation and questioning if these exports companies operating in African environment, have reached the IP. This latter is considered as a multi-dimensional construct. It includes many dimensions such as international sales growth, international market share, international profitability, international growth, etc. (Moen et al., 2008; Bianchi et al., 2017; Presutti, 2019). The majority of Tunisian companies are SMEs, their management teams are generally heterogeneous, especially in terms of skills (training and experience) (Ben Turkia, 1996). Many research works confirmed that SMEs acquiring IE and exposed to foreign culture and business, enhance the IP (Autio et al., 2000; Javalgi and Todd, 2011; Love and Ganotakis, 2013; Odorici and Presutti, 2013). In particular, Tunisian SMEs in the ICT sector have experienced significant growth due to the fact that their founders had lived, worked, studied abroad, and especially in Europe. They have acquired technological experience and knowledge, allowing them to play a fundamental role in identifying opportunities, especially at an international level (Mejri and Ramadan, 2016). Tunisian SMEs adopted different structures for export operations (Khemakhem, 2010). They are flexible in adapting to the specific regulations of each country, particularly on the African market (Mejri and Ramadan, 2016). Hence, an important question that arises at this level: what is the extent of the impact

of this foreign experience of Tunisian SMEs on their stretch in the African market and achieving global performance.

This reflects the desire of managers to make the best use of available resources and adopt an appropriate management style (Wiklund, 1999; Messeghem, 2003; Aloulou and Fayolle, 2005; Aloulou, 2017). Between the opportunities available on the one hand, and the IP objectives on the other hand, SMEs managers seem to be forced to adopt entrepreneurial behavior in order to directly influence global and IP (Lumpkin and Dess, 1996; Knight, 2000; 2001; Rauch et al., 2009). Some authors call this business behavior IEO, which according to them, is considered as a preliminary and essential phase to internationalization (O'Cass and Weerawardena, 2009) and positively affects IP of SMEs (Jantunen et al., 2005; Knight, 2001; Moreno and Casillas, 2008; Ripollés-Meliá et al., 2007; Wang, 2008; Slevin and Terjesen, 2011). Thus, IEO, known by its strategic aspect (Knight, 2001, Wales et al., 2011), refers to the taking of opportunities on the international market with an innovative, proactive and risk-seeking behavior (Jantunen et al., 2005; Wang, 2008; Glavas and Mathews, 2014). The choice of the IEO variable makes possible to trace the progressive path of internationalization. It affects decision-making style, strategic orientation, managerial processes, prospecting for opportunities, development of necessary resources, etc. However, in front of the uncertainty and turbulence of the international environment, SMEs may meet some obstacles to its internationalization (Genc et al., 2019). From another, SMEs become more motivated to improve its entrepreneurial mindset in order to benefit from new opportunities (Javalgi and Todd, 2011). As a consequence, researches become motivated to answer some important questions. How IP of Tunisian SMEs can be evaluated? How well Tunisian SMEs operating in ICT African market, are developing their IEO mindset and how it does affect their global competitiveness? To what extent the IE of Tunisian SMEs is leading to IP? What role of external environment is playing in moderating the effect of IEO on IP? (Figure 1). The hypotheses are as follow:

H1: IE of Tunisian SMEs impacts positively the IP.

H2: IEO of Tunisian SMEs impacts positively the IP.

H3: External environment moderates the relationship between IEO and IP.

This research will evaluate the capacity of ICT Tunisian SMEs to cope with environment especially in African context that can be characterized by uncertainty and turbulence. It would be saying that up to the moment, Tunisian SMEs do not know exactly how the African market really is, and their ability to adapt under the structuring of the economies of these continent countries. That's why researchers went to study this research problem.

## RESEARCH METHODOLOGY

Data collection has been done from Tunisian companies specialized in ICT and operating in Africa. A total of 46 valid Responses has been collected after distributing 733 electronically (see table 1). To measure variables included in this study (IE, IOE, Environment and IP), valid scales were chosen and adapted from developed literature (Belso-Martí'Nez, 2006; Blesa and Ripolles, 2008; Kenny and Fahy, 2011; Bianchi et al., 2017). All these latent variables are measured using a Likert-Scale five-point. Data were analyzed using PLS-SEM which is considered the most appropriate in this case of study due to some reason such as management science-based research (Alam et al., 2019a; 2019b), complex modeling (Hair et al., 2019), small sample size (Chin and Newsted, 1999).

## FINDINGS

This phase has a main objective to make solid constructs for analysis after declining unsuitable indicators by testing the reliability and validity. Reliability was evaluated by using composite reliability and Cronbach's Alpha. While convergent validity has been assessed using Average Variance Explained (AVE). Discriminant validity was computed using the approach of Fornell and Larcker (1982); (Hair et al., 2017) (Table 2 and Table 3). To explain structural relationships and test hypothesis, bootstrapping technique has been applied (Hair et al., 2017). Using path coefficient analysis direct relationships were tested and presented in table 4. IOE ( $\beta = 0.340$ ;  $p = 0.045 < 0.05$ ) and IE ( $\beta = 0.357$ ;  $p = 0.003 < 0.05$ ) impact significantly International Performance. Looking at the  $f^2$  values, the impact of IE is greater than IOE ( $f^2$  [IOE] = 0.129;  $f^2$  [IE] = 0.170). To test the moderating effect of Environment on the relationship between IOE and International Performance, moderation has been carried out. Results showed that Environment moderates the main relationship in the model as the impact of IOE on International Performance becomes non-significant (see table 5).

## DISCUSSION

As a theoretical contribution, this study showed to how extent the IP of SMEs may be impacted especially in the turbulent and uncertain environment. The IOE and IE showed their impact in the path of internationalization while ensuring business behavior of innovation and risk-taking (Lumpkin and Dess, 1996).

As a practical contribution, results showed that reaching IP does not necessarily depend on a long experience. Tunisian SMEs developed export activities to African countries, and improve their IP with short experience (6 years on average). Thus, the IP of Tunisian ICT SMEs is based on the prior IE of their founders and managers who should continue to learn from their African experience to sustain IP

in the instable environment (D'Angelo and Presutti, 2019). Tunisian SMEs are, therefore called upon not only to penetrate these emerging African markets but also to conserve them by providing innovative solutions, products and services to their African clients due to the moderator role of environment. This latter reduces the positive role of the IEO in enhancing IP. In addition, Tunisian ICT SMEs are invited to review continually their internationalization approach as the environment is turbulent (Filser and Eggers, 2014). Tunisian SMEs are limited resources and due to their relatively young age and small size, they should enhance continually their experience by learning-by-doing and exploiting external networks (D'Angelo and Presutti, 2019). Moreover, due to the turbulent African market, Tunisian SMEs are required to develop skills of intuition and anticipation on the market and seek new opportunities by mobilizing the dimensions of the IEO (Wirtz et al., 2016). The current difficult economic situation in Tunisia pushes these companies to seek alternative opportunities, especially after the 2011 revolution and COVID 19 pandemic. This research remains limited by the number of the Tunisian SMEs studied (only 46 SMEs). Thus, these results cannot be generalized. Furthermore, data used for this study are of transversal, so, to have a clear vision of Tunisian SMEs at different moments, it would be better to gather a longitudinal information in order to catch the evolution of international results especially after the pandemic of COVID-19 (Acosta et al., 2018).

# IMPRESSIONS ON THE IMAGES OF THE ANNUAL REPORTS: A GOFFMANNIAN AND BARTHESIAN ANALYSIS OF CSR REPORTING IN PETROBRAS

Almeida, Janaína<sup>1</sup>; Caria, Ana<sup>2</sup>; Oliveira, Lídia<sup>2</sup>

## ABSTRACT

The annual report is a communication vehicle between organisations and its stakeholders that assist them in the decision making process (Stanton *et al.*, 2004). Its content, structure and role has changed dramatically in the last fifty years (Beattie *et al.*, 2008). Adding to the quantitative information (mainly provided in the statutory financial statements), these reports are increasingly comprised by narratives and visual forms, such as tables, graphs, diagrams, the use of color and pictures. This visual turn of the annual reports reflects how social life and society is, today, vastly visual (Davison, 2015).

Visualisation plays an important role in experiencing and organizing reality. Therefore, the act of viewing is more than just seeing: the act of viewing assembles the experience of other sensory faculties, and brings the cultural, social and psychological knowledge to understand what is being visualized or experienced (Warren, 2005). "Furthermore, gaze is political. Who can be seen and who is invisible? Who looks at who and why? Who has the power to reveal and conceal?" (Warren, 2005: 863).

As a performing space, annual reports are similar to stages, in which scenes are performed and stories told. Narratives and visualisations tell the story of the organisations, "giving a holistic view of operations, value creation capacities, activities and processes" (Steenkamp and Hooks, 2011: 62). The growing investment in visual appearance and in writing mode is underpinned by the organisation's image management, the search for legitimacy in conveying of corporate social responsibility, also being seen as a mean of impression management (Beattie *et al.*, 2008; Hooghiemstra, 2000).

Impression management is a field of study within social psychology concerned with studying how individuals, conscious or unconscious, present themselves to others in order to generate a favorable perception (Hooghiemstra, 2000). It is the contemporary label for Goffman's self-presentation behavior described in Goffman's classical book *The presentation of self in everyday life*, published in 1959. In social interactions people manage the impression they make on others by modifying the way they act, the way they look and the scene they act on (Goffman, 1985). Within the organisational context, impression management has been applied to minimize the contradictions between the private and the public self, or between identity and image, with the intention of shaping the desired identity (Tata and Prasad, 2015).

Impression management behaviour can be assertive (or acquisitive/proactive) or defensive (or protective/reactive) (Hooghiemstra, 2000). The first category is undertaken to enhance an already established image or identity. Defensive impression management strategies, on the contrary, are used to repair a damaged or threatened image, as in the case of the adoption of corporate social reporting as a means to influence people's perceptions (Windscheid *et al.*, 2018). Corporate reporting can project a socially responsible image, enhance legitimacy and the organisation reputation (Tata and Prasad, 2015). It can also project the positive image and shape the perceptions of stakeholders.

In this context, and because visual images convey complex messages and ways to manage the impressions that render visibility to certain aspects of the organization (e.g. corporate brand, intellectual capital, accountability), this paper follows the call for more visual research in accounting (Davison, 2015; Corrigan, 2018) and seeks to examine the extent to which pictures are used to communicate and manage corporate social responsibility (CSR) information, by studying illustrative examples of the covers of the annual reports of the Brazilian oil and gas company Petrobras, from 1954 to 1984, through the lenses of Goffman and Barthes.

This research employs a qualitative case study within a methodological interpretive approach. A qualitative content analysis was developed through an interpretive reading of the symbolism that exists in the data sources that one has in hand. The goal was to interpret the meanings of the phenomena presented to the researcher in order to elucidate the meaning, unveil the intentions, compare, evaluate, discard the accessories, so that recognizing the essential, can give meaning to the actions.

It is a case study that empirically exemplifies the inclusion of theory, without the intention of showing superior practices, but illustrating theoretical categories that are observable in practice. The case study draws on the insights of Goffman's social psychology and Barthes's philosophy. Goffman's (1985) dramaturgical concepts of stages, scenes, collusion, expressive control, directive dominance, dramatisation, teams, reciprocal familiarity, idealisation, characters, regions, performance, secret society and social values, and Barthes (1990, 2012) semiotic concepts of linguistic message, denotation, and connotation, referent, spectator, studium, punctum, noema, blind field and scrutinize are used to analyse the covers of Petrobras annual reports, illustrating the company's practice and seeking to enlarge our knowledge of a multifaceted phenomenon.

Petrobras is a majority state-owned Brazilian oil and gas company, founded in 1953, that operates in more than 25 countries around the world. Petrobras was chosen as a case study because it operates in an economic sector with significant social, environmental and economic impacts, providing an interesting field of study in what relates to the disclosure of CSR issues and its impression management. Until the 1970s, corporate reporting was mainly financial, but even before that time

Petrobras was already reporting more than the financial statements which implies that the company was already managing the stakeholders' opinions and searching for legitimacy.

During a period of military dictatorship, the covers of the Petrobras annual reports, through the use of photographs, convey messages related to company's activities, its employees, its assets, its values, and the environment, managing positively the stakeholders' perceptions.

Under Goffman (1985)'s lenses, each cover represents a theatricalisation, a scene that portrays activities related to the company. During the analyzed period, the chosen scenarios contain essential elements to sharpen the imagination of those who were interested in Petrobras, particularly the petroleum tower and the sky, and other natural elements such as the vegetation, the oil and the sea. These visual images contain a literal message (denotation) and symbolic message (connotation), according to Barthes (1990). The tower and the oil are directly related to the activity of Petrobras; the sky is the backdrop to the tower's verticality and to the rise of oil, its most valuable asset, and shows that behind the activities of the company is the reach of the dream of rising Petrobras and the Brazilian Nation, reinforcing a positive idealisation. This was the intention of the Government and the Company in a period of military dictatorship: to achieve the status of a large company, seeming to boost the development of the country itself. The use of these elements contributed to a construction of reality, creating an optimistic perception about the company, in particular hiding the environmental impacts of the Petrobras activity. In this theatrical context, the characters (Goffman, 1985) are the Petrobras employees, and from their performance emerge the existence of familiarity and of teamwork to reach a common purpose: the well-being of Brazilian people and of the planet, social values, symbolized by vegetation elements. Sometimes it seems there is a secret society (Goffman, 1985), working in collusion for a common purpose.

The results of this case study reveal that the role of annual reports has evolved from conventional communicator of financial information to "storytelling" and the use of pictures is an interesting way of enhancing the story (Steenkamp and Hooks, 2011). Their covers are an open door to disclose CSR issues and to influence the stakeholders' perceptions about the company, creating an imaginary scenario in which the chosen scenic elements incorporate intentional connotative meanings.

### ABSTRACT

Women's decisions to migrate can be driven by different factors including marriage, family, education, the labour market and business venturing opportunities in the receiving country. According to World Migration Report (2020), there are 130 million migrant women worldwide, constituting 48% of all international migrants. However, female migrants received a scant attention of scholars within the migration literature (Hofmann and Buckley, 2013), with even fewer focus on the professional lives of highly skilled migrant women in post-migration period (Meares, 2010; Webb, 2014). Despite their competences that will be demanded in the labour market of the host country, qualified female migrants may opt for business venturing for a variety of reasons. Chreim et al. (2018) argue that extant research on immigrant female entrepreneurship mainly focuses on lower-skill and low-growth sector strategies by giving a scant attention to highly skilled migrant women entrepreneurs targeting high-growth business strategies. Hence, we argue that there is an insufficient understanding of how highly educated and skilled female migrants can contribute to global business and entrepreneurship fields given the unwarranted assumptions regarding their peculiarities and the deficit of interdisciplinary approaches.

One of these unwarranted assumptions is that migrant women face a "double disadvantage" in the receiving context first as migrants and second as women (Dhaliwal and Kangis, 2006; Rajman and Semyonov, 1997). The disadvantages faced by third-world country citizens are tripled due to the difficulties of adapting to the labour market and institutional environment of advanced economies (Rajman and Semyonov, 1997). Hence, we claim that disadvantages inherent to migrant women entrepreneurs needs to be paid more attention to and should be considered as an entrepreneurial dimension of female migrant entrepreneurs. Furthermore, there is a scarce empirical evidence that comprehensively explains the contextual factors enabling and constraining immigrant female entrepreneurs and their businesses in the host country (Azmat, 2013; Brieger and Gielnik, 2020; Chreim et al., 2018). Given the entrepreneurial ecosystem's feature of being a prominent "contextual-description tool" within the entrepreneurial discussions (Ahokangas et al., 2018), we will link the

female migrants, who might have faced certain disadvantages, and their businesses to their entrepreneurial ecosystem in the host country.

Entrepreneurial ecosystem is constructed of two components that of an “entrepreneurial” and the “ecosystem”. The first part of the phrase is “entrepreneurial” and it is understood as the process of opportunity exploration, evaluation and exploitation for the development of new products and services (Schumpeter, 1934; Shane and Venkataraman 2000), whereas the second part of the phrase is “ecosystem” and it comes from the ecology (biology) literature and defined as “all systems which contain biotic and abiotic components, which are interdependent” (Doing, 1997, p. 222). Hence, entrepreneurial ecosystem is defined as “a set of interdependent actors and factors coordinated in such a way that they enable productive entrepreneurship within a particular territory” (Stam and Spigel 2016, p. 1). According to Isenberg (2011), entrepreneurial ecosystem is comprised of policy, markets, supports, culture, human capital and finance. By dividing these elements into framework conditions and systematic conditions, Stam (2015) states that entrepreneurial action (the process of opportunity exploration and exploitation) is enabled by the combination of both conditions. However, Stam and Van de Ven (2019) argue that entrepreneurial ecosystem’s elements not only facilitate the entrepreneurship within a certain territory, but it can also constrain it. Hence, the aim of our research is to explore:

- How does the entrepreneurial ecosystem of highly skilled immigrant female entrepreneurs influence their businesses given their peculiarities and potential? and
- How do migrant women entrepreneurs contribute to their entrepreneurial ecosystem?

By building on the cases of six highly educated and skilled migrant women entrepreneurs based in Northern Finland and based on Autio et al. (2018)’s structural framework (EE Structures, EE Processes, EE Contingencies and EE Outcomes), we will examine the role of entrepreneurial ecosystem in migrant women’s businesses. The data was collected via semi-structured interviews and participant observations from immigrant female entrepreneurs with diverse cultural backgrounds (the UK, the Netherlands, China and Russia). The collected data was recorded, transcribed and coded based on Lichtman’s (2013) “Three C’s” method. The researcher triangulation was maintained while coding the data.

Our findings demonstrate that difficulties experienced by highly skilled migrant women entrepreneurs stem from their immigration background, family and motherhood status. The working routine of migrant women entrepreneurs with pre-school and primary school children depended on the educational system of the receiving country. Furthermore, insufficient fluency in host country’s language, cultural dissimilarities and narrow understanding of the receiving country’s legislation and

its requirements made it difficult for immigrant female entrepreneurs to launch and continue their ventures independently. Thus, the “double disadvantage” (Dhaliwal and Kangis, 2006; Rajman and Semyonov, 1997) faced by interviewed highly skilled immigrant female entrepreneurs caused financial, market and institutional constraints. The obstacles arising from the disadvantages inherent to female migrant business owners were overcome with the support of entrepreneurial ecosystem and migrant women were able to start and continue their businesses. Hence, entrepreneurial ecosystem was acting as an enabler of immigrant female entrepreneurs’ businesses (Stam, 2015). However, motherhood status and immigration background of migrant women entrepreneurs inhibited them to exploit the opportunities from the entrepreneurial ecosystem to the greatest extent. In their turn, immigrant female entrepreneurs were contributing to the entrepreneurial ecosystem of the receiving country by disseminating the information among the local companies about the business venturing opportunities in their country of origin, sharing the knowledge with their fellow peers and providing any means of support to them.

Theoretically, we contribute both to entrepreneurial ecosystem and migrant women entrepreneurship literature. We contribute to entrepreneurial ecosystem literature by considering both the gender and migration backgrounds of entrepreneurs in the ecosystem that differ from entrepreneurs in general per se, whereas the migrant women entrepreneurship literature is enlarged by comprehensively considering the contextual factors including the entrepreneurial ecosystem’s elements, processes, contingencies and outcomes impacting on female migrants’ businesses.

We suggest to policymakers that policies encouraging entrepreneurial activities of population should be more gender and migrant inclusive. Policies targeting the enhancement of entrepreneurial actions of migrants should be designed by taking into consideration the immigration period of entrepreneurs. In their turn, immigrant female entrepreneurs should share their concerns and initiate the type of support that they need from local authorities.

Our findings were limited to the data collected from highly skilled immigrant female entrepreneurs based in Northern Finland. Future research should consider the entrepreneurial ecosystem of migrant women entrepreneurs based in other developed countries and less-developing contexts with different educational backgrounds and competences. Furthermore, in this research the entrepreneurial ecosystem of immigrant female entrepreneurs was analysed from female migrants’ perspectives. Therefore, future research should examine the entrepreneurial ecosystem’s actors’ viewpoint regarding the entrepreneurial actions of migrant women.

## THE TAX REGIME OF NON-HABITUAL RESIDENTS IN PORTUGAL

Amorim, José<sup>1</sup>; Pereira, Adalmiro<sup>1</sup>; Vaz, Ângela<sup>2</sup>

<sup>1</sup>Management, ISCAP-PPorto, CEOS member, Porto, Portugal

<sup>2</sup>ISCAP-PPorto, Andrade & Brandão, Lda member, Porto, Portugal

<sup>3</sup>ISCAP-PPorto, Porto, Portugal

### ABSTRACT

#### THE TAX REGIME OF NON-HABITUAL RESIDENTS IN PORTUGAL

The tax regime of non-habitual residents (NHR) is particularly attractive for non-residents who practice high value-added activities, and for dependent and independent workers or members of statutory bodies of the legal persons who want to obtain a residency in Portugal in order to achieve tax benefits.

In this context of international tax competition and loss of tax competitiveness, the creation of new strategies and external investment funding instruments is imposed. The creation of the non-habitual residents' tax regime (NHR) had the intent to reduce the tax burden in order to welcome new investors and prevent the relocation of the "volatile taxpayer" for more attractive tax environments (Nascimento et al., 2010).

The need for the introduction of the NHR regime was already being claimed since 2008. Article 126 of Law No. 64-A/2008 of 31 December, which approved the State Budget for 2009, authorized the government to create a tax regime for NHR for Income Taxation of Individuals.

The objective of this new regime is to attract people and investment to Portugal by means of qualified professionals in various sectors of the economic activity, but also people with high net worth (Ferreira & Gonçalves, 2012), the so-called *High Net Worth Individuals* (HNWI), which move essentially for reasons of tax order (Borges & Sousa, 2011).

The tax attraction of these people is possible in two different ways: through the exemption method by eliminating the double international taxation of foreign source income earned by NHR, or through a mitigated and proportional taxation of certain income from dependent and independent workers (including those obtained in Portugal), earned by IRS taxpayers to whom this quality is recognized.

The tax system of NHR is applied to citizens who have lived abroad for the past five years and who are now living in Portugal for more than 183 days, having acquired an apartment in Portugal to live there.

For example, if a foreign citizen, NHR in Portugal in 2016, remains in 2018 for only 3 months for having sold his apartment in Portugal, but continues to earn income from dependent work

in Portugal in the same year, the citizen will no longer be able to benefit from the right to be taxed as a NHR, since he will not complete the residency criteria of paragraphs a) and b) of number 1 of Article 16 of the IRS. Effectively, this foreign citizen, staying less than 183 days in Portugal in 2018, and not possessing housing conditions that indicate that the person might intend to maintain and occupy it as habitual residence, will be now taxed as non-resident as far as the income of national source is concerned.

After successive changes to the CIRS, the tax regime of the NHR has become particularly attractive to the qualified professionals working with high value-added activities, with scientific, artistic or technical nature and for individuals with high net worth. This regime is provided as an incentive to foreign investment for non-residents who carry on high value-added activities abroad and who are willing to establish permanent domicile in Portugal, as well as for non-residents who, being dependent workers or members of statutory bodies of legal persons only want to establish in Portugal a temporary residence in order to earn income, because they have been detached or expatriated.

In this paper we analyse the impact of NHR in Portugal. Our main limitation is access to data from the State. For future works we propose a study to compare the Portuguese situation and Spanish situation.

## PREDICTING INTRADAY STOCK PRICES IN POST-COMMUNIST EUROPEAN MARKETS USING ARTIFICIAL INTELLIGENCE

Anghel, Dan Gabriel

The Bucharest University of Economic Studies, Bucharest, Romania

### ABSTRACT

We evaluate if forecasting models derived from artificial intelligence (AI), machine learning techniques (see, e.g., Géron, 2019) are able to successfully predict future stock prices in Eastern European countries that were formally part of the Communist Bloc (Dragotă and Țilică, 2014; Anghel, 2014). We contribute to the literature by focusing on intraday predictability, which has been hardly analyzed in these markets, especially using recently introduced machine learning tools. The specific models that we consider are: Support Vector Machines (SVM; Cortes and Vapnik, 1995), Logistic Regression (LOGISTIC), Random Forests (FOREST; Ho, 1998), Deep Neural Networks with a Wide-and-Deep architecture (WDNN; Cheng et al., 2016), and three Recurrent Neural Networks (Rumelhart, 1986) with a Simple (SRNN), Deep (DRNN), or Long-Short Term Memory architecture (LSTMNN). The data sample is collected from Bloomberg and consists of 15-minute intraday prices for the main market indexes in Serbia (index name BELEX15), Romania (BET), Bosnia and Herzegovina (BIRS), Hungary (BUX), Croatia (CRO), North Macedonia (MBI), Ukraine (PFTS), The Czech Republic (PX), Bulgaria (SOFIX), and Poland (WIG). The sample spans from December 27, 2017 to June 4, 2020 and contains a total of 127,681 intraday data points.

For each index, AI models are fitted on the first 10% of observations and are then used to make out-of-sample predictions (this avoids hindsight bias) regarding the 1-step-ahead direction of price movements, being retrained every 4 calendar weeks. The resulting series of predictions are used to estimate the average prediction accuracy and the average excess return over a benchmark buy-and-hold strategy, which simply buys the index at the beginning of the testing sample and does not perform any additional trades. Because of known market limitations, we assume no short trades are possible. For all models, we test the statistical significance of both performance measures using a Student's t-test for the difference in means, with threshold values of 50% for the accuracy and 0% for the excess return. We also compare the results obtained by the AI models with a naïve strategy that simply predicts that the previous price change will repeat in the future.

The results in Table 1 show that the AI models display superior predictive accuracy for intraday prices in the analyzed markets, both compared to the 50% threshold as well as to the naïve model. However, the results in Table 2 show that AI models are not generally capable of earning statistically significant excess returns over the buy-and-hold strategy, even when no adjustments are performed for trading

costs and other market frictions. Similar to some previous results (e.g., Anghel, 2017, 2020), this implies that (1) the considered forecasting models have no economic relevance for investors that trade on intraday stock prices in Post-Communist European markets and that (2) these young markets are efficient at pricing historical intraday information (Fama, 1970; Timmermann and Granger, 2004) even when tested against modern forecasting algorithms derived from Artificial Intelligence. Our findings are surprising in showing a severe limitation of AI models when used to forecast intraday stock prices.

Table 1. Forecasting accuracy

| Market Index | Forecasting model |           |           |           |           |           |           |           |

## INVESTIGATING LINK BETWEEN INTELLECTUAL CAPITAL AND BUSINESS MODEL: A SYSTEMATIC LITERATURE REVIEW

**Baima, Gabriele<sup>1</sup>; Forliano, Canio<sup>2</sup>; Santoro, Gabriele<sup>1</sup>; Bresciani, Stefano<sup>1</sup>**

<sup>1</sup>Department of Management, University of Turin, Turin, Italy

<sup>2</sup>Department of Political Science and International Relations, University of Palermo, Palermo, Italy

### ABSTRACT

Intellectual capital is considered a key intangible asset for firms (Nahapiet & Ghoshal, 1998). Intellectual capital has a history as topic and has been proposed as one of the most relevant drivers of growth and key capitals in entrepreneurial development over time (Halberstadt et al., 2019). Overall, studies found a positive significant relationship between financial performance of firms and intellectual value added, intellectual capital efficiency, relational capital efficiency, human capital efficiency, and structural capital efficiency (Salehi et al., 2014). As a consequence, it is well established that intellectual capital affects firm performance positively and provides competitive advantage.

Despite this, there is less studies when it comes to consider intellectual capital and the effect on and the relationship with business model and business model innovation. The concept of business model and business model innovation build on several strategic management theories (Amit & Zott, 2001). Where a business model has been used as a mean to create value in a business, business model innovation refers to planned, novel and innovative changes to the fundamental features of the firm's business model and/or the structural design linking these elements (Foss & Saebi, 2018), and also to the way in which the firm collaborates at strategic and operational levels in order to bring products and/or services to the market (Bouwman et al., 2018).

Previously, most literature in the field of business models focused on their structural features and assumed a static relationship among their various elements (Demil & Lecocq, 2010). More recently, however, researchers have underlined the need for a holistic perspective that incorporates innovation in the various elements involved in the value generation and delivery processes (Massa et al., 2017), since fundamental changes in the relationship between the business model elements can lead to a higher level of business model innovation.

As aforementioned, the relationship between intellectual capital and business model has been quite neglected by the literature, or at least it leaves room for further research lines. For example, a rich stream of studies in the intellectual capital field, has assessed the impact of intellectual capital on value capture (Salehi et al. 2014), one fundamental aspect of business model. Despite this, less effort has been directed when it comes to consider the business model through a holistic lens or considering

other business model components apart from value capture (Beattie & Smith, 2013). For example, little is known on how firms used the various intellectual capital assets to leverage new forms of value proposition, new target markets or new sources of revenues. These changes represent the core of the business model innovation and are considered as key driver of sustainable competitive advantages in the current era affected by globalized markets (Del Giudice et al., 2019; Santoro et al., 2019).

As a consequence, the aim of this work is to explore the relationships between intellectual capital and business model. In order to do this, the present research builds on the systematic literature review (SLR) methodology, to trace what we know on this topic and to propose future lines of research based on the found gaps.

Two research questions have been proposed to investigate the linkages between intellectual capital and business model, and to explore possible future research trends of business and management studies regarding intellectual capital and business model.

From preliminary findings emerges that, regarding the first research question, it is possible to underline that, if we consider value capture as a fundamental element of the business model, the literature of its connection with intellectual capital is very rich. However, most studies have focused on economic value (Nielsen et al., 2017), neglecting social and environmental value. This represents a significant research gap, which allows us to answer the second research question. We currently live in an era in which there is great awareness of sustainability issues. Future studies should study how intellectual capital and its components can contribute to solving social and environmental problems and create value for different stakeholders (Porter & Kramer, 2019), not only for shareholders. For some years now, scholars have been talking about green intellectual capital (Chen, 2008). This stream of literature should focus on creating value, with a focus on the value created for the community, the environment, employees and the territory at large. Studies should focus on the role of knowledge, information and relationships in the development of business models that have a social and environmental impact. Moreover, future studies should further analyse the “dark side” of IC and value creation, aiming to identify why and how in some case intellectual capital assets could lead to a “value destruction”.

Furthermore, few studies consider the business model through a holistic lens (Beattie & Smith, 2013). Recent history sees many companies able to use their intellectual capital, knowledge, unique skills and dynamic capabilities to change their business model. However, the scientific literature on the subject seems to be very scarce. Studies should focus on companies' ability to create new products and value propositions, enter new markets, create new pricing models, through the use of their intellectual capital.

The paper offers the following main theoretical implications. First, it contributes to the well-established literature on intellectual capital (Nahapiet & Ghoshal, 1998) by shedding light on the current interconnections between intellectual capital and business model. Therefore, the study contributes to the intellectual capital literature by identifying several research gaps that should be filled by future studies. Moreover, the research underlines the key role of intellectual capital assets in driving business model innovation, which are increasingly important in the current hyper-competitive international markets (Beattie & Smith, 2013).

## DETERMINANTS OF CAPITAL RATIOS IN EUROPEAN BANKS AFTER THE SOVEREIGN CRISIS

**Barros, Victor; Sarmiento, Joaquim Miranda; Toscano, Vanessa**

ISEG - Lisbon School of Economics and Management, Universidade de Lisboa, ADVANCE/CSG, Lisbon, Portugal

### ABSTRACT

The aim of this study is to investigate the determinants of banks' capital ratios in Europe during the sovereign crisis period of 2011-2018. The literature has established patterns of determinants of capital ratios across several countries and during a significant period. However, this time is different. Banks had accumulated sovereign debt in their assets' portfolio, whereas their capital ratios had been relatively low during the pre-crisis period. The sovereign crisis followed a financial crisis which severely affected the financial sector. The volatility in sovereign debt risk was pronounced during the sovereign crisis. Our paper concludes that size and capital structure matters in explaining banks' capital ratios. Larger banks accommodate lower capital buffers, while both higher risk-weighted assets and higher leverage negatively affect Common Equity Tier 1 Capital. Surprisingly, profitability is not a driver of capital ratios during the sovereign crises in Europe. Low levels of profitability and considerable volatility may explain the inconclusive effect of profitability in enhancing banks' capital. Interestingly, our results support the hypothesis that quantitative easing packages enhanced banks' capital buffers, which suggests that the ECB's decisions effectively added to banks' capital requirements.

# CONTEXTUAL ORGANISATIONAL AMBIDEXTERITY AND EMPLOYEE INNOVATIVE BEHAVIOUR: THE CASE OF AUSTRALIAN PUBLIC HEALTHCARE SERVICES SECTOR

**Behmanesh, Iman; Cunneen, David J.; Malik, Ashish**

Newcastle Business School, Faculty of Business and Law, The University of Newcastle, New South Wales, Australia

## ABSTRACT

## BACKGROUND

The Australian public healthcare services sector is facing growing pressure to achieve more with less, stimulating demand for increased innovation to provide better healthcare services (Sharma & Conduit, 2016). We argue that a strong focus upon contextual organisational ambidexterity (COA), underpinned by high involvement work systems (HIWS), may be particularly appropriate to encourage employee innovation in this large and complex sector. Evidence from other public sector contexts suggests that creating a culture of employee involvement and commitment, may lead to empowered healthcare workers able and willing to deliver significant healthcare innovations and new work procedures (Malik et al., 2017).

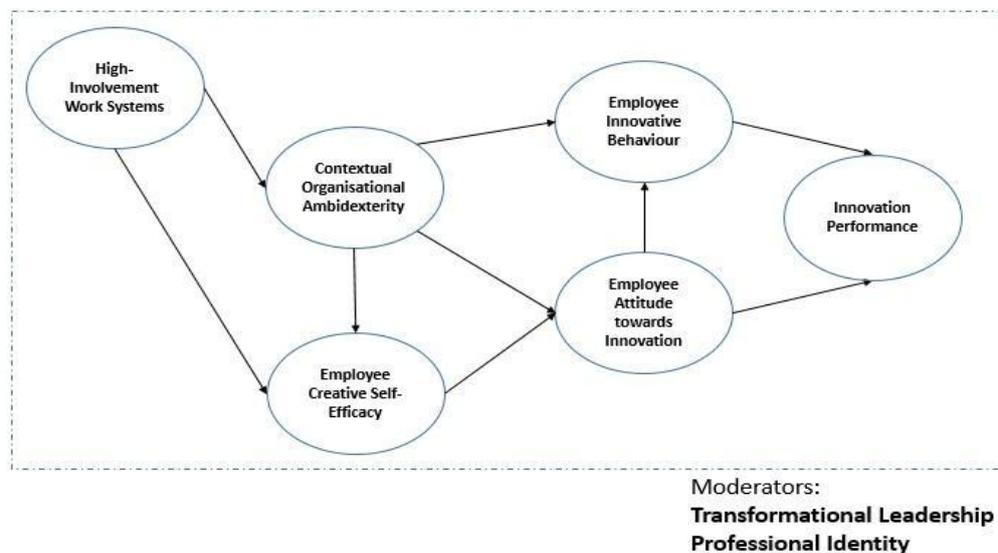

## THEORETICAL FRAMEWORK

Limited research exists on how to create cultural environments that motivate employees to pursue higher levels of innovation and enhance organisational performance. HIWS theory focuses on four key dimensions that may impact this environment: power/autonomy, information sharing between members of an organisation, rewards, plus knowledge and skills. A focus on these dimensions helps firms develop positive employee values and behaviours, as well as promoting work environments to achieve COA (Plimmer et al., 2017). COA is an innovative environment that encourages employees to simultaneously divide their time between exploitation (improvements in existing processes and procedures) and exploration (developing new innovations). In turn, COA may drive employee creative self-efficacy, employee attitudes towards innovation and employee innovative behaviour. Employee creative self-efficacy – an employee's self-belief in their ability to produce creative or innovative outcomes – motivates pursuing creative and innovative performance (Puente-Diaz, 2016). Employee attitudes towards a behaviour is an employee's attitude towards pursuing innovation. Finally, employee innovative behaviour is an employee's openness and willingness to engage in innovation, which may further promote positive COA. In sum, a presence of these three conditions

may be conducive to promoting COA and hence positively impact Australian public healthcare services innovation performance. This argument is modelled in Figure 1.

Two potential moderators that may affect the model's relationships are transformational leadership and professional identity. Literature suggests transformational leadership may be positively associated with COA (Lewis et al., 2014). Likewise, professional identity, defined as attitudes, values, knowledge and beliefs held amongst a professional group (Adams et al., 2006), has been found to be a moderating variable in high diversity work environments, such as that found in the Australian public healthcare services sector.

**Figure 1. Conceptual Framework**

## IMPLICATIONS AND FUTURE WORK

Identifying specific, critical conditions for improving COA in the Australian public healthcare services sector may guide senior managers and policy makers in the sector to focus upon what is most likely to promote better, innovative performance. A mixed-methods research design will be used to gather data to better understand the model's relationships in the Australian public healthcare services sector.

## SUSTAINABLE DEVELOPMENT GOALS: IMPLICATIONS FOR GLOBAL BUSINESS STRATEGY

**Belyaeva, Zhanna; Lopatkova, Yana**

Graduate School of Economics and Management, Ural Federal University, GSEM-UrFU, Yekaterinburg, Russia

### ABSTRACT

The global economy evolution under the influence of increasing importance of sustainable development builds a relatively new strategic framework embracing government, business and society (UN, 2015; Pedersen, 2018; Rosati and Fari, 2019). Thus, the study is an attempt to apply flipped approach to sustainable development strategies applications for small and medium sized enterprises (SMEs). Sustainable development represent a modern agenda 2030 for all stakeholders formulated by the United Nations and consists of 17 goals and 169 specific targets, indicators, and metrics of sustainability, which ensure balanced economic growth taking into account socioeconomic coordinates (UN, 2015). Businesses as a stakeholder have vital potential to contribute to achieving the SDGs through their core activities (Sullivan et al., 2018) and by implementing Corporate Social Responsibility (CSR) initiatives (Kumi et al, 2020). There are few literature streams to explore the role of enterprises in enhancing global sustainability within the context of their commercial activities (Sullivan et al., 2018), which mostly explore global businesses. The large businesses are entitled to integrated sustainability institutionally (Campbell, 2006) while tools to link the SDGs with the business processes of SMEs has not yet been clearly defined and regulated (Verboven and Vanherck, 2016). Researchers revealed that practices carried out by big companies could not be directly adopted and implemented by SMEs (Belyaeva, et al., 2020).

The presented research aims to reveal the most directed SDGs for SMEs and applying data of analytical agencies and organisations (Scott and McGill, 2019; Ogorodnikov and Remizov, 2019; ITC, 2020), primary research data conducted among 750 SMEs operating in six European (Belyaeva et al., 2020) to find out whether strategies of big and small companies differ in concepts of sustainable business transformation.

The study briefly outlined in the presented abstract is based on statistical comparative analysis applying the non-parametric U Mann-Whitney test to examine the significance of the differences between Western (Poland, Croatia and Russia) and Eastern European (Great Britain, Germany and Spain) SMEs. This method was chosen due to non-normal distribution and dispersion inequality.

The SMEs sustainable strategies are differ from big companies due to simplified and more organic organisational structure; have fewer stakeholders and less formalised management. Nevertheless, modern external factors influence the change in the business model and strategy of SMEs as well as big

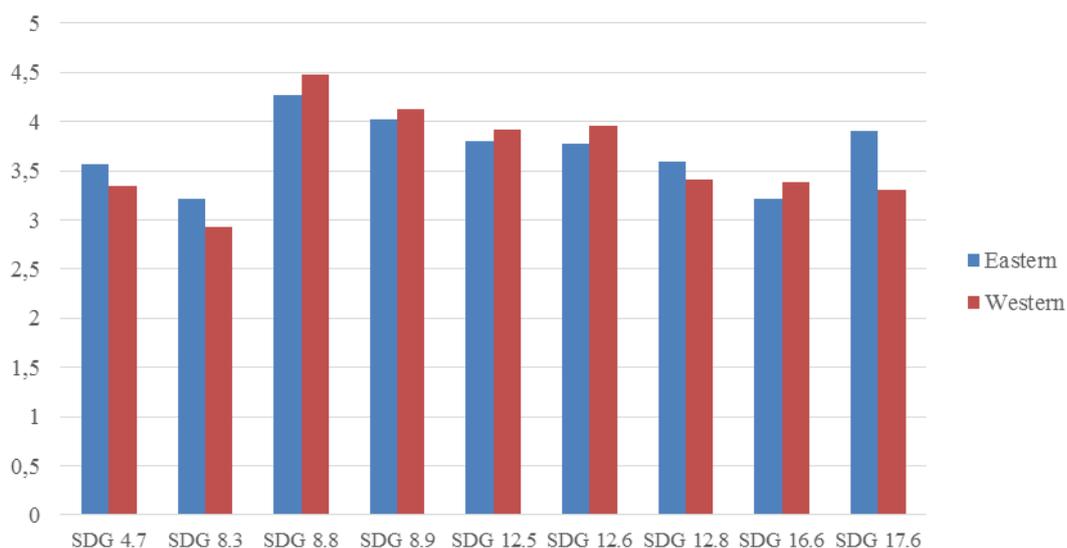

corporations. SME's representatives distinguish three important factors: (1) the importance of business intangible assets (image, loyalty) is increasing (2) competition is running high and (3) information and communication technologies (ICT) are developing, new electronic tools are emerging. In addition, external factors such as environmental regulations, labor rights laws, and pressure from company's stakeholders influence the business strategy and the overall process (Belyaeva and Lopatkova, 2020).

Our findings show the following: the lack of financial resources ( $\bar{X} = 3.59$ ), limited organizational capacity such as lack of time ( $\bar{X} = 3.38$ ) and knowledge on this subject ( $\bar{X} = 3.23$ ) constitute a barrier hindering SMEs sustainable strategies implementation, but in the same time the research outcome correlate with existent literature streams suggesting that SMEs potential contribution to sustainable development is large (Lessidrenska, 2019; Verboven and Vanherck, 2016).

While sustainable strategies of big companies are focused on a wide range of SDGs and transparent by presenting in reports, social networks, websites, rankings (Scott and McGill, 2019; Ogorodnikov and Remizov, 2019), the strategy of SMEs is covert and focused on a small amount of SDGs. Generally, we find that SMEs play a leading role in achieving sustainable goals related to the economy.

There are also differences in sustainable directions of SMEs depending on the country of origin, the presence of agile management and other factors. In this article the authors use the non-parametric U Mann-Whitney test was used to examine the significance of the differences between Western (Poland, Croatia and Russia) and Eastern European (Great Britain, Germany and Spain) SMEs. This method was chosen due to non-normal distribution and dispersion inequality. The priority areas for a sustainable SMEs strategy have been aligned with the SDGs and the difference between Eastern and Western SMEs is revealed (figure 1).

Figure 1 – SDGs goals in SMEs strategies in Western and Eastern European countries

The results show the different mix of economic, social and environmental processes in Western and Eastern European countries creates a special environment for the application of sustainable strategies. The results reveal that Western European SMEs are more active in responsible consumption and production (Goals 12.5 and 12.6) compared with Eastern companies because Western European companies reduce waste and save resources by implementation of lean production. Moreover, SMEs from Western Europe provide transparent information about the origin of the products components. At the same time, Eastern European SMEs involve stakeholders and organize employee training in social and environmental activities that people have relevant information on sustainability and acquire the knowledge necessary to promote sustainable development (Goals 12.8 and 4.7). Both Western and Eastern European SMEs focus on decent work and economic growth (Goal 8) in particular Western SMEs provide jobs primarily for local residents and ensure safe working conditions whereas European SMEs try to maintain Work Life Balance for their employees. Another difference lies in the fact that Western European SMEs strives to reach Goal 16 by improving internal management system and meet international standards, when Eastern European SMEs set cooperation with business partners based on ethical principles (Goal 17.6). However, despite the differences, the overall approach to sustainable strategies in SMEs in Western and Eastern Europe is built around the social and economic SDGs, largely excluding environmental goals.

In conclusion, there is awareness of the gaps in achieving the SDGs by 2030, besides, according to Sachs et al (2020) the Covid-19 will have profound implications on SDGs progress, and in short-term will have highly negative effects on SDGs 1, 2, 3, 8, 10. Thus, achieving the SDGs requires a strong public consensus, which implies collaboration and dialogue with all stakeholders. All enterprises can contribute to the achievement of the SDGs no matter how large or small companies and regardless of their industry. While the scale and scope of the SDGs is unprecedented, covering all areas of life on the planet, the fundamental ways that business can contribute remain unchanged. Thus, business model and strategy transformation is vital required towards set of social, environmental and economic SDGs (UN Global Compact, 2020).

## DO DOMESTIC FIRMS NEED TO LEARN FROM MNCs TO EXPORT? EVIDENCE FROM SWISS MANUFACTURING INDUSTRY

Ben Hamida, Lamia

La Haute école de gestion Arc, University of Applied Sciences and Arts Western Switzerland// HES-SO, Neuchâtel, Switzerland

### ABSTRACT

Our paper attempts to examine how domestic firms<sup>1</sup> manage to benefit from the export activities of large multinational corporations (MNCs). We analyze export spillovers from MNCs, in which export specific knowledge of MNCs that are experienced on foreign markets may spill over to domestic firms, improving their export performance. Multinational firm has a significant advantage over domestic firm since it can benefit from the existing international network of the entire corporation to start export operations and overcome the fixed costs induced by these activities (Blomström and Kokko, 1998). The contacts of domestic firms with export oriented MNCs provide both knowledge about the product and process technologies and international market conditions and access to foreign marketing and distribution networks – for example, foreign preferences regarding design, packaging, and product quality – raising the export and productivity performances in domestic firms through export spillovers.

The export activities of MNCs may benefit domestic firms when the export specific knowledge that MNCs are experienced on foreign markets may spill over to domestic firms, allowing them to reduce the cost of access to these markets. By learning from MNCs, domestic SMEs are likely to raise their export propensity or intensify their export volume.

Our paper analyzes export spillover effects from MNCs to domestic firms in terms of propensity and intensity. These effects have been studied by a number of scholars (Aitken et al., 1997; Greenaway et al., 2004; Ruane and Sutherland, 2005; Koeing et al., 2009; Giuliano et al., 2014; and so on), nonetheless, the empirical results are rather mixed and evidence on this kind of spillovers demonstrates considerable heterogeneity (Harasztosi, 2016). For example, Greenaway et al. (2004) supported the finding of positive export spillovers from the foreign affiliates' export operations on the export decision of domestic firms in United Kingdom. They also tested export spillover effects on the domestic firms' exported volume on which they failed to find a significant effect. Ruane and Sutherland (2005) also found that the decision by domestic firms in Ireland to enter the export market

---

<sup>1</sup> Domestic firms used in this paper refer to exporting and non-exporting firms that are not investing in FDI. A great number of them is small and medium enterprises "SMEs".

is positively associated with the presence of foreign affiliates in their sector, while, their export intensity is negatively associated with the export sales ratios of foreign affiliates. In addition, Barrios et al. (2001) and Lutz et al. (2003) failed to find evidence on the probability those domestic manufacturing firms in, respectively, Spain and Ukraine will export following the export activity of MNCs' affiliates in the same sectors. Only other foreign affiliates benefit from export spillovers. Görg and Strobl (2003) failed as well to find evidence on export spillovers from MNCs or from other domestic firms in Spain between 1990 and 1998.

We argue that knowledge transfer is not an automatic process and the resultant spillover benefit depends on different key factors. First, it depends on the contact between the sender and the recipient of the knowledge. Domestic firms can enhance their exports when investing in learning activities by observing and imitating MNCs counterparts and/or reinforcing vertical linkages with MNCs' suppliers and customers. Export learning is more likely to be vertical than horizontal. That is, when domestic products are exported, foreign customers can suggest improvements to the manufacturing process (Grossman and Helpman, 1991). By doing so, foreign customers transmit tacit knowledge and sometimes knowledge from other suppliers (Wei and Liu, 2004). They also tend to transmit prototypes of exported products, knowledge of foreign markets and provide technical assistance to domestic users (Minska-Strusik, 2012). The knowledge received by domestic users would be spill over to other domestic forms (suppliers or customers) through vertical linkages. Second, knowledge would be transmitted more efficiently when the domestic receiver is located nearby the MNC sender and its transmission costs are assumed to increase with distance (Audretsch, 1998). Domestic firms in the same region observe and imitate foreign knowledge more efficiently than more distant ones (Aitken and Harrison, 1999). The channels of knowledge diffusion are then reinforced at regional level (Crespo et al., 2008). Third, we think that higher cultural and geographical distances may hamper the path of domestic international expansion, since exporting costs increase with destination's geographical and cultural distances (Lawless, 2010, Giuliano et al. 2014). MNCs that have multi-market presence would be then a valuable source of knowledge on foreign market, allowing domestic firms to export to the culturally and geographically distant destinations.

According to the above arguments, we expect the following hypotheses:

*H1. The presence of export spillovers on the export decision and the export volume of domestic firms is more pronounced with neighboring MNCs.*

*H2. Export spillovers on the export decision and the export volume of domestic firms are more likely to be vertical (from MNCs' suppliers and customers) than horizontal (from MNCs' counterparts).*

H3. *Export spillovers on the export decision and the export volume of domestic firms are higher as export destination's geographical and cultural distances increase.*

We test our hypotheses using firms-level data from manufacturing industry in Switzerland. Our data is derived from innovation activity survey (2015) of manufacturing firms, with at least five employees, conducted at the Swiss Institute for Business Cycle Research (KOF). Switzerland is an interesting case study since export is a preeminent activity in Swiss economy (BFS, 2016). More than a third of the turnover of Swiss manufacturing firms in 2015 (34.4%) was generated by exports, making manufacturing the most export-oriented industry in Switzerland (FTA, 2017). In addition, Swiss government, especially at canton level, is more and more active in encouraging export activities. And there has been no investigation of the potentially beneficial export spillover effects of MNCs on domestic manufacturing firms in Switzerland.

Our Probit and OLS regression results show that (1) domestic firms benefit from the presence of MNCs' exporters in their industry and from the export activities of their upstream MNCs' suppliers. This seems true for export propensity and intensity of Swiss domestic firms. The benefit from backward linkages is three time larger than that of horizontal effects. (2) Both horizontal and vertical effects are higher when spillovers are specific by destination and domestic firms do not seem to use the same channel when exporting to different destinations. The decision of domestic firms to enter European market is positively determined by the export activities of their MNCs' counterparts and suppliers attending the same market, while only the export activities of their MNCs' suppliers improve their export volume to this market. Domestic firms exporting to USA seems to benefit from export activities of their MNCs' counterparts in terms of export propensity and from their MNCs' customers in terms of export volume. And regarding Asian destination, domestic firms benefit from export activities of their upstream MNCs' suppliers to start exporting and from horizontal effects to intensify their export volume. (3) Spillover benefits seem to be larger when domestic firms decide to enter Asian and American markets. (4) The effect of spillovers does not seem to become stronger when MNCs and domestic firms are located in the same region. And (5) domestic firms need to invest in learning activities when absorbing foreign knowledge to intensify their export volume.

On the policy front, suggestions with respect to encourage export, following such findings, must consider that MNCs are important catalysts for the export performance of domestic firms. Horizontal and vertical linkages are both important for export intensity and propensity of domestic firms. Actions should encourage collaborations between domestic firms and MNCs to promote the flow of knowledge between firms and facilitate the assimilation and absorption processes. Nonetheless, they should consider the heterogeneity of domestic firms regarding the channel they choose to export to a

specific destination. In addition, domestic firms need to invest in absorbing foreign knowledge to successfully intensify their export volume.

# INTERNATIONALIZATION AND MENA COUNTRIES: A SYSTEMATIC LITERATURE REVIEW

**Bertello, Alberto<sup>1</sup>; Ferraris, Alberto<sup>1,2</sup>; Stefano Bresciani<sup>1</sup>; Matteo Massucco<sup>1</sup>**

<sup>1</sup>Department of Management, University of Torino, Torino, Italy

<sup>2</sup>Graduate School of Economics and Management, Ural Federal University, Yekaterinburg, Russia

## ABSTRACT

### LITERATURE GAP AND MOTIVATION.

According to the rapid evolution of the world's markets in the recent years, internationalization has become a fixed step for the development of the competitiveness of the firms (Chen *et al.*, 2016; Ferraris *et al.*, 2019; Gaur and Kumar, 2010). The concept of competitiveness itself has undergone re-conceptualizations and the economic and financial aspects are now accompanied by concerns related to sustainability in terms of social and environmental impact. According to this perspective, international marketing, which is a rather established domain of research, is called to evolve. The academic literature in this field has in fact focused its research on different sectors and different contexts (Skarmeas *et al.*, 2016; Vellas, 2016; Ibeh *et al.*, 2019), however, few research has so far focused on MENA (Middle Eastern and North African) countries<sup>1</sup> that represent a unique field of investigation for many reasons. First, in view of the growth prospects in terms of demography, employment and economy. Second, because of the transition that this macro-region is facing, according to which it is expected that the driving sectors of the future will no longer be linked to the exploitation of natural resources and fossil fuels. Third, MENA countries are characterized by specific geopolitical contexts, due to wars and cultural clashes, as well as highly uncertain environments and markets (McKee *et al.*, 2017; Woert and Martinez, 2018). A need to systematize previous research and to provide avenues for future research in internationalization and MENA countries emerges from the analysis of extant literature. Therefore, in this work, we aim to develop a systematic review to answer two main research questions: "What do we know and don't know about internationalization patterns involving firms in MENA context? What kind of convergence do exist between the internationalization behavior of these firms and the latest trends in international marketing research?"

---

<sup>1</sup> According to the World Bank (2019), MENA countries are Algeria, Arabia Saudita, Bahrain, Djibouti, Egypt, United Arab Emirates, Jordan, Iran, Iraq, Israel, Kuwait, Lebanon, Libya, Morocco, Oman, Qatar, Syria, Tunisia, and Yemen.

## METHOD

We searched within Clarivate's Web of Science and Scopus online databases and we included a common for both databases specific decennial-timeframe, covering years from 2000 to 2019. We implemented a search structure which operates within titles, abstracts, and keywords of journal articles as well (Aguinis and Glavas, 2012; Pisani *et al.* 2017). Based on those assumptions, we developed our keyword search algorithm, then applying the following search string: ("MENA" OR "middle east" OR "north Africa") AND ("international\*" OR "transnational\*" OR "multinational\*" OR "global\*") AND ("marketing").

The initial result amounted in an initial sample of 105 references by Scopus and 361 by Web of Science, for a total of 476 studies collected. The initial pool was then refined in order to discard duplicates, even if some specific exclusion criteria were already implemented in the research frame on database to distil the final data set. First, as a setting of database source, we only included articles published in peer-reviewed journals, as they are widely regarded as including validated knowledge, in the way it likely influences the field (López-Duarte *et al.*, 2016; Podsakoff *et al.*, 2005; Xiao and Nicholson, 2013). Second, following other systematic reviews (e.g., Christofi *et al.*, 2017; López-Duarte *et al.*, 2016) we excluded articles published in non-academic peer review journals, editorials, book chapters, commentaries, secondary articles, short communication articles, executive summaries, viewpoints, or conference proceedings. Third, we excluded articles published in a non-English language (Rashman *et al.*, 2009), due to language limitations of the researchers. As regards the following step, we collected the resulting items supported by a reference management software in order to complete a subsequent full reading of the abstracts to check for eligibility. In doing this, we excluded duplicated articles (37) and books or books chapter items (11) which still appeared after the former database refining, indicating our first partial amount in 428 studies collected. Then, we compared findings between publication sources with an objective ranking of academic journals such as Academic Journal Guide (AJG) by Chartered Association of Business Schools CABS (2018), selecting only academic articles which appeared on academic journals ranked "4\*", "4", "3" and "2". This criterion reduced our sample to 181 articles. Subsequently, we excluded 112 studies that were non-relevant to internationalization process of the firms, or that were marginally concerned in firms' patterns regarding internationalization in MENA region. After this screening process, 69 studies were admitted as relevant items to our review question. Next, following Rajwani and Liedong (2015) and Nofal *et al.* (2018), we employed a backward and forward snowballing process by manually searching the references of all selected articles. This additional step provided another 8 journal articles which were also subjected to the main inclusion or exclusion trial using title, abstract and sample analysis, and CABS ranking compliance as well.

## PRELIMINARY FINDINGS

The results of this study have been grouped in three sections: descriptive analysis, research streams analysis, and avenues for future research.

In particular, the first section reveals the distribution of the articles by year of publication, the distribution of the articles by journal, the journal areas of the sample of articles, the distribution of articles by geographical affiliation of the first author, the distribution of articles by paper nature and by methodology applied, the distribution of articles by sector of activity of firms in sample, and the distribution of articles by countries studied.

The second section analyses the research streams by individuating the theories, the components and tools applied, and the research output. In this regard, streams in research sample clearly polarize on three main threads, such as internationalization & MNEs strategies, finance, and resource capabilities and knowledge management, while only little part of global extant literature in sample faces threads such as innovation and digitalization, human resources management, entrepreneurship and small business management, and ethics and corporate social responsibility.

The third section suggests, according to the findings and the trends in internationalization research in MENA countries, avenues for future research. Some of the future lines of research are:

- outward strategies in MENA countries: most of the companies aiming to internationalize outside the MENA countries are moved by push factors. Companies headquartered in MENA countries are in fact often called to deal with uncertain conditions due to growing competition in internal markets (also due to the entry of MNEs), to contexts of war, political instability, or market closure. Consequently, they are subject to push factors that push them to operate even outside the original context. Indeed, it might be interesting to analyse how exogenous and endogenous factors may influence outward internationalization strategies in MENA countries. In this regard, the combination of different theoretical approaches such as institutional theory and resource-based view could provide novel answers and enrich the results.

- explore the links between the international marketing area and research streams in related disciplines: the systematic review reveals how the financial and strategic domains have been the most addressed so far. However, there is still a paucity of studies in up to date disciplines that are related to marketing and internationalization. Further studies should therefore analyse the phenomenon of internationalization in MENA countries by exploring the links between marketing and other disciplines such as innovation, digitalization, human resources management, entrepreneurship and SMEs, ethics, and sustainability.

- comparison between internationalization in MENA countries and traditional internationalization research: due to the reduced number of studies which focus on aspects such as human resource

management, entrepreneurship, digitalization, and ethics, further studies should adopt as starting point the traditional literature on internationalization to analyse similarities and differences between the established literature and the emerging research stream related to the MENA countries.

# CORRELATION OF WOMEN QUOTA AND PROFIT MEASURED BY EBIT OF DAX 30 COMPANIES

**Binder, Bettina C.K.**

School of Management and Engineering, Pforzheim University, Pforzheim, Germany

## ABSTRACT

Over the last 50 years women made significant advances in the participation in executive boards of international companies. Looking to German DAX 30 companies women remain underrepresented in leadership positions.

The present paper examines the relationship between gender quota and financial performance based on the Key Performance Indicator (KPI) of the Earnings before Interests and taxes (EBIT) of DAX 30 companies. The correlation of EBIT is worked out and the women quota is measured for DAX 30 companies to identify independencies and trends.

## INTRODUCTION

This paper offers insights into the relationship between gender quota of Germany's largest listed companies, DAX 30, and the financial KPI EBIT. For this purpose the paper builds upon existing literature on gender management, women quota and statistical analysis, etc. Thus, the paper contributes to an enhanced understanding of the business environment of some of the most powerful German companies and the progress made regarding women presence on executive boards.

## LITERATURE REVIEW

In 2016 a starting point of the women quota of 30 percent in supervisory boards should be achieved by publicly traded companies, which are also fully obliged to employee co-determination (BMFSFJ, 2017). The women quota was optional but determines the importance of female representation on executive boards. Perryman *et al.* (2011) argued about the risk of gender differences on firm performance, while Gassam (2018) discussed measures to increase female leadership. In this context, the following hypothesis is formulated and will be dealt with in the following sections:

H1: The higher the women quota in executive boards of DAX 30 companies, the higher the financial success measured by EBIT.

## METHODOLOGY

DAX 30 was selected as one of the most important financial indexes in Germany. It comprises the 30 largest companies in terms of EBIT. In order to show the correlation in the statistical analysis for the women quota and EBIT, data was collected from the websites of DAX 30 companies, and especially from their annual reports.

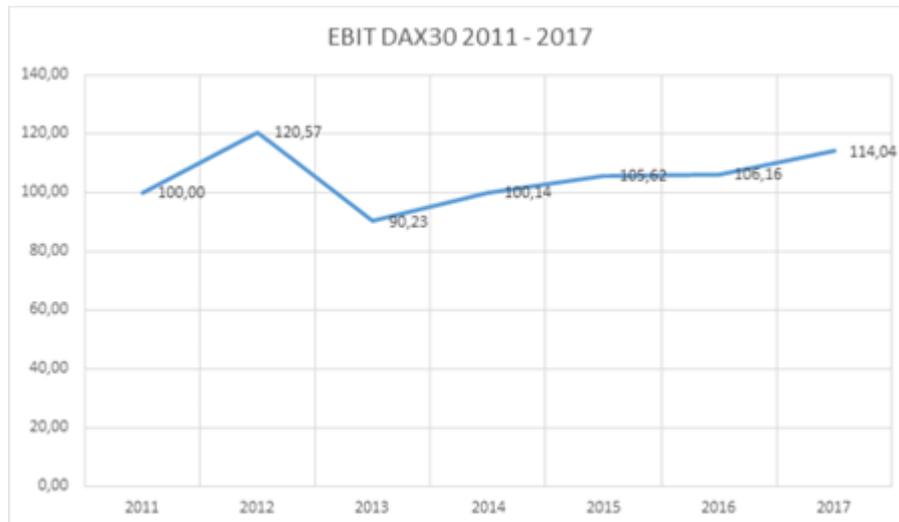

Figure 14: EBIT development of DAX 30 from 2011 – 2017 in percentage

## FINDINGS

Since 2011 when DAX 30 companies voluntarily committed to increase female representation at board level, there is a visible progress registered, which shows a constant increase over the years from 2011 - 2017. To obtain a more detailed a categorization on the basis of sectors of activity was created.

|   |   |  |
|---|---|--|
| <b>Automotive Sector:</b><br>BMW<br>Daimler<br>Lufthansa<br>Volkswagen<br>Continental | <b>Chemical Sector:</b><br>BASF<br>Bayer<br>Linde                                     | <b>Energy Sector:</b><br>EON<br>RWE  |
| <b>Medical Sector:</b><br>Fresenius<br>Fresenius Medical Care Merck                   | <b>Industrial Sector:</b><br>Covestro<br>Heidelberg Cement<br>Siemens<br>Thyssenkrupp | <b>Financial Sector:</b><br>Allianz<br>Commerzbank<br>Deutsche Bank<br>Deutsche Börse<br>Munich Re |
| <b>Retail Sector:</b><br>Beiersdorf<br>Adidas<br>Henkel                               | <b>Service Sector:</b><br>Deutsche Post<br>Deutsche Telekom<br>Vonovia                | <b>Technology Sector:</b><br>Infineon<br>SAP   |

Figure 2: DAX 30 companies integrated into nine sectors

The woman quota has the highest value in the financial sector (18,75%) followed by the industrial sector (16,67%) in 2017.

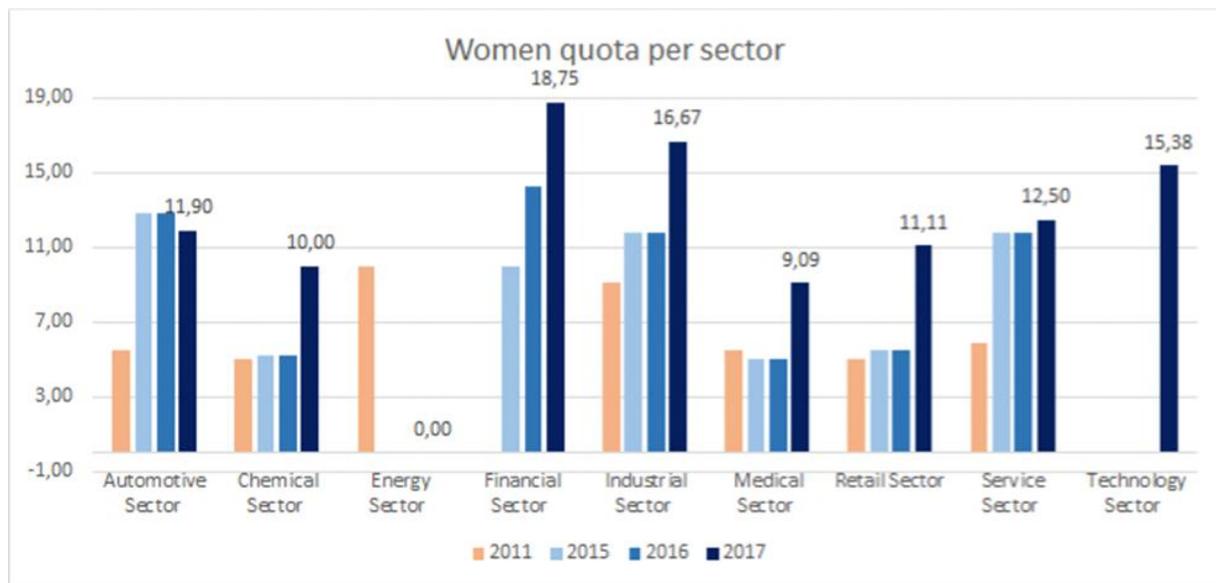

Figure 3: Woman quota of DAX 30 companies per sector

## DISCUSSION OF RESULTS AND CONCLUSION

The statistical analysis conducted in this paper has shown that the raised hypothesis can be supported. Having a specific number of female leaders as a strategic company goal could create benefits as far as EBIT is concerned. Companies like Adidas, Fresenius Medical Care Merck or VW have already recognized the importance and employed a Chief Diversity Officer (CDO) who reports directly to the executive board.

# WOMEN QUOTA OF DAX 30 COMPANIES AND THEIR CORPORATE SUSTAINABILITY REPORTING

**Binder, Bettina C.K.**

School of Management and Engineering, Pforzheim University, Pforzheim, Germany

## ABSTRACT

The promotion of women on boards caused heated public and governmental debates and scholars became interested too in the investigation of the impact of mixed boards on companies' financial performance, decision making, boardroom culture, etc. The present paper examines the relationship between gender quota and sustainability reporting based on Global Reporting Initiative of DAX 30 companies and it develops a women in management (WIM) index based on the importance of gender related subjects as displayed by DAX 30 companies in their sustainability reports.

## INTRODUCTION

This paper offers insights into the relationship between gender quota of Germany's largest listed companies, DAX 30, and sustainability reporting. For this purpose the paper builds upon existing literature on diversity management, corporate governance, Global Reporting Initiative (GRI), women quota regulations, etc. Thus, the paper contributes to an enhanced understanding of the business environment of some of the most powerful German companies and the progress made regarding women presence on boards.

## LITERATURE REVIEW

In 2011 Germany's largest listed companies, DAX 30, committed voluntarily to increase female representation by setting self-imposed targets. As the progress was slow, in May 2015 "The Equal Participation of Women and Men in Leadership Positions" law was passed, requiring that starting with 2016 a women quota of 30 percent in supervisory boards should be achieved by publicly traded companies, which are also fully obliged to employee co-determination (BMFSFJ, 2017). The importance of female representation on boards can be determined also by analysing the sustainability reports of companies and here GRI Standards play an essential role as the guidelines are not only a means for companies to "understand and communicate the impact of business on critical sustainability issues" (globalreporting.org), but they also represent an international framework which facilitates comparisons of companies' reports be it at national level or in different countries. Leach *et al.*, 2016 (p. 4) argued that "gender equality must be integral to sustainable development", while the European Commission (2015)

indicated that “not taking advantage of skills of highly qualified women constitutes a waste of talent and a loss of economic growth potential”. In this context, the following hypothesis is formulated and will be dealt with in the following sections:

H1: Companies which frequently bring forward gender related topics in their sustainability reports, also attain higher women quota on their boards.

## METHODOLOGY

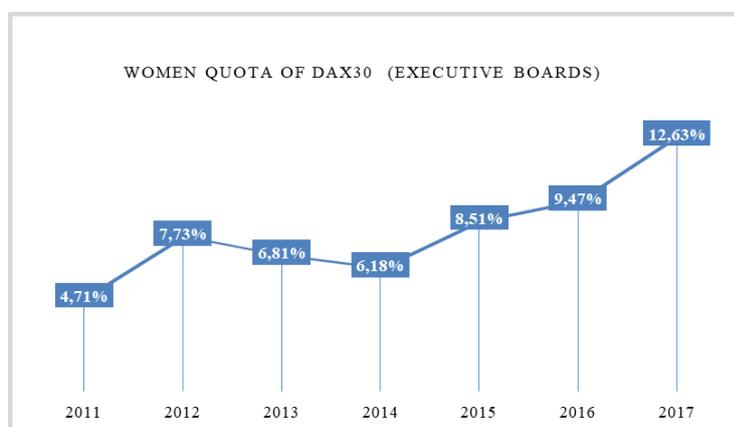

DAX 30 was selected as one of the most important indexes in Germany. It comprises the 30 largest companies by exchange turnover and market capitalization, and it “acts as a key indicator for the strength of the German economy” (deutscheboerse.com). In order to conduct the statistical analysis necessary for determining the women quota and the frequency of gender related topics, data was collected from the websites of DAX 30 companies, and especially from their annual reports. The GRI reports (and other sustainability reports) were scanned for the terms “women”, “gender equality” and “women quota” (“women” keywords). The total number of hits was afterward divided by the total number of hits of GRI specific keywords: “economic”, “environment/al” and “social”. The following table gives a short insight of the WIM index for the company BASF.

| No. of hits for “economic” | No. of hits for “environment/al” | No. of hits for “social” | Σ of hits “economic”<br>“environment/al”<br>“social” | Σ of hits for<br>“women” keywords | WIM index |
|----------------------------|----------------------------------|--------------------------|--|-----------------------------------|-----------|
| 37                         | 69                               | 97                       | 203  | 24                                | 11.8%     |

**Table 15: WIM index of the company BASF**

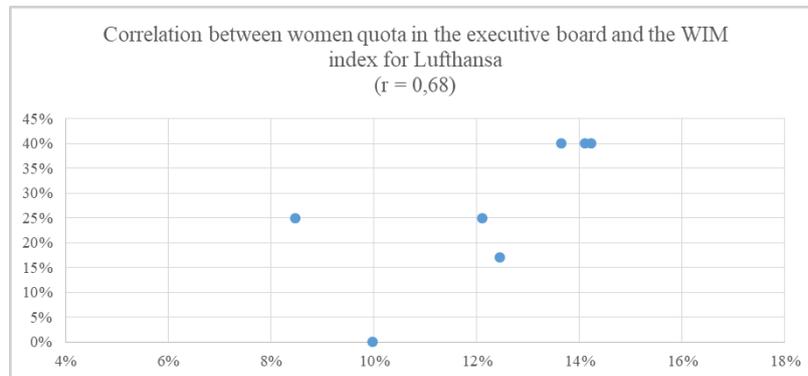

## FINDINGS

Since 2011 when DAX 30 companies voluntarily committed to increase female representation at board level, there is a visible progress registered, yet it is still a long way to go up to gender parity.

**Figure 1: Women quota across all DAX 30 companies in the executive board**

At supervisory board level the introduction of the mandatory women quota is effective as also showed by Holst and Wrohlich (2018), DAX 30 companies reaching in 2017 33,3 percent. When conducting a correlation analysis between the WIM index and the women quota for single companies as in the following example (company Lufthansa, data for 2011-2017), a strong correlation was found.

**Figure 2: Correlation between women quota and WIM index of Lufthansa**

## DISCUSSION OF RESULTS AND CONCLUSION

The statistical analysis conducted in this paper has shown that the raised hypothesis can be supported. In the same time, a certain caution is recommended as companies might write extensively in their sustainability reports about the importance of women and diversity in their companies, while not having any women on the management board.

*Keywords: women quota, Global Reporting Initiative (GRI), diversity management, corporate sustainability reporting*

## RECENT DIRECTIONS IN INTERNATIONAL BUSINESS EDUCATION

**Bolívar, Luis Miguel**

Universidad Tecnológica de Bolívar

### ABSTRACT

Multinational firm managers and professionals around the world are constantly facing new challenges, dealing with global issues, foreign cultures, technological changes, social trends, and political shifts, in order to make appropriate decisions. This article will aim to analyze how the international business manager and professional is being instructed at the higher education level and how the curriculum is being configured to convey relevance in such global context. We revise the direction that education of the human resource in international business has taken in the past 30 years and how its set of dimensions have evolved over time. Thus, this study identifies how the competencies required to perform in international business have evolved, as well as how the pedagogical perspectives have changed to cope with practical requirements. In addition, we show how the contents on geographical markets have shifted in importance due to development and growth patterns of the world. And finally, we observe how all of this has put pressure for the schools' structure to adapt in order to accommodate the increased relevance of international business programs.

### INTRODUCTION

There is an ever-growing concern around the world about the education of the international business manager, either from the perspective of pedagogy applied to the international business (IB) discipline as such, or from the incorporation of 'international' elements into the business administration discipline. Thus, we have sought to understand what sort of inputs must be considered in building an exceptional curriculum and successful educational strategies in the formation of an international business manager capable to excel in such challenging context. For this purpose, we have reviewed the scope of the mainstream trends in international business education that have been portrayed by researchers who in recent years have studied the problems and trends of the discipline. These contributions of theoretical and empirical nature are showing the technological and pedagogical changes of education at a global level, as well as the new challenges of the international business professional. Consequently, this article shows the results of a review of the reach, in the past 30 years, of research in education for global business; we describe the changes and evolution of 1) the key competences of interest in global management, 2) cultural competences required, 3) the pedagogical perspectives and tools, 4) the transitory geographical focus, and 5) the programs and schools'

structures and configuration. With these contents, we aim to contribute to business administration themes by providing insight on how a broad range of international business concerns must be a part of the education of managers across the world.

Hence, to illustrate the evolution of this discipline, we have reviewed the main international journals in the areas of international business studies, global strategy, human resource management, international business education and global business education, by searching published articles since 1990, for key terms in education, teaching and skills associated with the construction of the international business administration curriculum.

## EVOLUTION OF INTERNATIONAL BUSINESS EDUCATION

As a result of this exploration, we have found five major aspects that have evolved to shape the discipline today. We have separated this evolution into three great decades, with some flexibility, to locate the emergence or consolidation of specific trends, as detailed in Fig. 1.

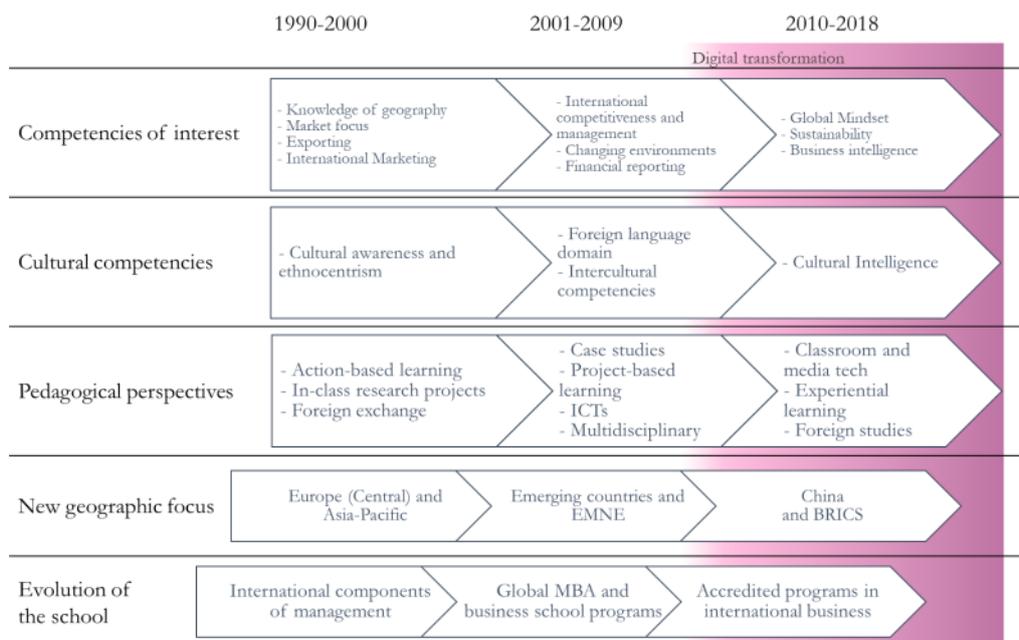

Fig. 1. Trends in International Business Education

First, we reveal the competences in which the interest of IB training schools focused, noting how themes moved from technical and 'how to do business abroad' issues (Wardrope *et al.*, 2009), then to issues needing superior analytical skills, and to elevated ethical and technological themes (Czinkota, 1994). From these competencies we have extracted the cultural component as a special category, which evolved from mere cultural awareness (Mathews, 2006; Andresen y Bergdolt, 2017) in the nascent years to cultural intelligence in recent times (Aggarwal y Goodell, 2014).

Second, we present the changes in the tools and the pedagogical perspectives applied over the years, which started as traditional business teaching methods (Danford, 2006; Folks, Jones y Hudgens, 2011)

and evolved into IB special techniques such as international experiential learning (Budde-Sung, 2011). Third, we note how the interest in learning 'how to do business with a specific location' shifted from Europe, to emerging markets to China and the BRICS specifically. And finally, we show the emergence and transformation of specific programs in international business, which departed from being a component of management to become a separate discipline with accredited undergraduate and graduate programs on its own (Wardrope et al., 2009).

In addition to these components we identified that most recently, the fourth industrial revolution and digital transformation are key issues affecting every aspect of the international business professional work and their developmental process (Akdeniz, Zhang y Cavusgil, 2019). Thus, we also explore how these digitalization phenomena are impacting the IB manager competences, and geographical focus, as well as the schools' pedagogical perspectives and its structure's evolution (De Beule *et al.*, 2019).

## CONCLUSIONS

This article has aimed to analyze, from a scholarly perspective, how the global-minded manager, that is, the international business professional, is being trained and delivered to the global environment of business. We observed how the human resource in international business have been educated in the past 30 years. We have observed that not only the competencies required to perform in international business have evolved, but also, that pedagogical perspectives have changed to cope with practical requirements. In addition, geographical markets have shifted in importance due to development and growth patterns. In consequence, all of this has put pressure for the schools' structure to adapt in order to accommodate the increased relevance of international business programs. In sum, we contribute by drawing the international business education landscape and exposing how it is impacting the quality and relevance of the human resource in charge of leading globally oriented organizations.

## WHO DOES JOIN THE ANTI-BRAND COMMUNITIES ON THE INTERNET?

**Brandão, Amélia<sup>1</sup>; Popoli, Paolo<sup>2</sup>**

<sup>1</sup>Department of Management, University of Porto, Porto, Portugal;

<sup>2</sup>Department of Management and Quantitative Methods, Parthenope University of Naples, Naples, Italy.

### ABSTRACT

In recent decades, there have been countless negative feelings about brands with very significant impacts on companies and especially on the value of brands, so it is extremely important to be able to deal with them in the context of management (Zarantonello *et al.*, 2016). Negative consumer emotions about brands arise from stimuli that may be associated with products or services (tangible elements) or branding elements (intangible elements) (Romani *et al.*, 2012); moreover, with the growing opposition to capitalism and corporate globalization, an increase of anti-brand communities has been observed (Awasthi *et al.*, 2012; Carvalho and Fernandes, 2018; Kucuk, 2018).

In the specific context of the anti-brand communities, members have negative feelings towards a particular brand, and very often their focus is the pursuit of social justice, being activists of global anti-brand movements (Hollenbeck and Zinkhan, 2010).

In these cases, consumers resist capitalism, globalization, marketing efforts, and strategies of a corporate brand, trying to create a new collective identity (Awasthi *et al.*, 2012). (Hollenbeck and Zinkhan, 2010; Romani *et al.*, 2015). As opposed to this thinking, other members simply integrate these communities due to functional issues of products and/or services (Kucuk, 2008) based on negative past experiences (Bryson *et al.*, 2013, Zarantonello *et al.*, 2018).

In summary, anti-brand communities usually arise due to four reasons (Awasthi *et al.*, 2012):

1. Provide a social community where members share common moral obligations;
2. Provide a support network to achieve common goals;
3. Provide a way to deal with workplace difficulties, fighting for labor rights;
4. Provide a resource center for action, through demonstrations or boycotts.

Whatever the reasons, anti-brand communities aim to weaken a hatred brand, reduce its value, cultivate a feeling of revenge (Grégoire *et al.*, 2009; Cooper *et al.*, 2019).

On the Internet domain, this aggregation of consumers takes the twofold form of anti-brand websites and interest groups on social network platforms (Facebook, Instagram, Twitter). Recently, the growing popularity of social networks has increased the opportunities for consumers to connect with other users, share opinions and information, conditioning purchase intentions and behaviors of other consumers (Hennig-Thurau *et al.*, 2004; Chang and Wu, 2014; Mirbagheri and Najmi, 2019). Moreover, another interesting phenomenon is that individuals now rely more on their peers than on the

companies themselves to obtain information about products and/or services (Gavilan *et al.*, 2018). The interactions that exist in technological platforms facilitate the decision-making process of the purchase of a good or service are the main sources of social influence in this process (Amblee and Bui, 2011). In this way, the academic literature indicates that consumers have the capacity to influence each other (Cialdini and Goldstein, 2004), being the Internet the environment in which this phenomenon is more explicit, since this influence is omnipresent and exercised through recommendations, evaluations and verbal evaluations (Amblee and Bui, 2011).

Despite this phenomenon is increasingly present in our society and shows great relevance to the management, the available literature on the anti-brand communities on the Internet is very scarce (Krishnamurthy and Kucuk, 2009; Zarantonello *et al.*, 2016). Moreover, no studies have been conducted so far on the analysis of the profile of who participates in an anti-brand community.

On the basis of these premises, this study aims to provide useful insights on the anti-brand communities on the Internet, investigating the profile of the consumers who join anti-brand communities; in particular, after splitting consumers with negative feelings into two categories based on their participation to anti-brand community or not, the main purpose is to investigate whether several consumers' characteristics (sex, age, country of origin, education and empathy) affect the willingness to join an anti-brand community in the social networks' domain.

In order to achieve this purpose, an empirical study will carry out based on a survey on consumers of the ten strongest global brands, identified through a preliminary study as follow: *Apple, Google, Coca-Cola, Microsoft, Samsung, IBM, Toyota, General Electric, Amazon, Mercedes*.

Subsequently, the following research hypotheses will be tested through statistical tools:

*Hypothesis 1:* Consumer profile (gender, age, country, education and empathy) influences the intensity of consumer negative feelings towards brands.

*Hypothesis 2:* Consumer profile (gender, age, country, education and empathy) influences the willingness to integrate anti-brand communities on the internet.

*Hypothesis 3:* The more empathic a consumer is, the greater their sense of brand hatred.

*Hypothesis 4:* Consumers who consider joining an anti-brand community are those who hate brands the most.

*Hypothesis 5:* Consumers who hate brands the most are those who have an active participation in anti-brand communities.

The originality of this study refers to the specific place on the Internet where anti-brand communities are investigated, i.e. the social networks; moreover, as far as the authors know, there are no previous studies focusing on the consumers' profile as a conditioning factor in the choice of whether or not to join an anti-brand community. The findings of this study could provide an interesting contribution to

the branding theory since identifying the profile of the consumers joining anti-brand communities on the Internet helps to better understand the phenomenon of negative consumer-brand relationships. Lastly, the study findings could provide useful inputs for brand managers in order to keep under control the wide range of consumer-brand relationships, and identify how to communicate better with the market to minimize the risks of a negative perceptions of material and immaterial dimensions of the brand.

*Keywords: negative feelings; negative consumer-brand relationships; brand hate; anti-brand movements; anti-brand communities; anti-brand websites; social networks.*

## INTERNATIONALIZATION OF DIGITAL FIRMS: A SYSTEMATIC LITERATURE REVIEW AND FUTURE RESEARCH AGENDA

**Brenner, Constantin Cyprian; Enke, Susanne**

Chair of International Management, Otto-von-Guericke University, Magdeburg, Germany

### ABSTRACT

Over the past decade, digitalization has fundamentally transformed and revolutionized how companies conduct business internationally (UNCTAD 2019). When Marriott hotel was founded in 1927, it took the company more than 40 years until its first international expansion and almost 100 years to expand into additional 132 countries while owning approximately 1.4 million hotel rooms (Marriott 2019). In contrast, Airbnb expanded to more than 220 countries within the last 12 years while not owning a single room (Airbnb 2020). These fundamental differences in the internationalization speed and entry mode can be attributed in most parts to Airbnb's use of a platform business model and, thus, to the underlying digital technology (Nambisan et al. 2019; Brouthers et al. 2016).

Digitalization has challenged the academic foundations on which the field of international business (IB) resides (Eden 2016) by changing the nature of the internationalization process in terms of entry mode choice, speed, scale, and scope (Coviello et al. 2017). The integration of digitalization into the IB field is rather novel as scholars have just recently started to acknowledge the new digital reality as a new context for IB and initiated the adaption of certain assumptions and theories relevant to the field (Alcácer et al. 2016; Banalieva and Dhanaraj 2019; Autio and Zander 2016). This paper sets out to provide a comprehensive review of IB literature and its adjacent academic fields in the context of digitalization by identifying established concepts, contradictions, and avenues for future research.

In recent years, academics have started to integrate digitalization into the IB field selectively. Due to digitalization, scholars started to theorize about network-based ownership advantages as a new type of firm-specific advantage (FSA) within internationalization theory (Banalieva and Dhanaraj 2019; Buckley and Casson 1976). Similarly, multiple authors challenge the mechanisms and implications of the process theory of internationalization (Johanson and Vahlne 2009), within the context of digital firms (Nambisan et al. 2019; Brouthers et al. 2016; Monaghan et al. 2020). Enhanced flexibility, scalability, and automation, combined with user network effects and the ability to directly engage with stakeholders, provoke a new kind of internationalization process (Monaghan et al. 2020). This process is more time-compressed, broader in scope, and more resource-light, therefore challenging the relatively slow and incremental foreign expansion suggested by the process theory of internationalization (Nambisan et al. 2019) Monaghan et al. 2020).

While the examples above display how scholars have selectively commenced integrating the new digital reality into existing IB theories, their endeavours are starting to lay the foundation for systematic and comprehensive integration of digitalization into the IB field. However, the lack of a well-defined research agenda delimits our current understanding of the phenomenon. Therefore, this literature review sets out to provide a comprehensive understanding of the relationship between digitalization and internationalization. By doing so, this paper acknowledges existing research accomplishments, unveils contradictory propositions and findings (e.g., (Banalieva and Dhanaraj 2019); (Hennart 2019)), and identifies potential gaps for research extension.

To conduct a systematic literature review, we searched the Web of Science and Scopus databases for articles that contain the terms 'digitalization' and 'internationalization' in their topic field and were published in leading business journals (based on SSCI impact factors  $\geq 1.5$ ). Additionally, we review major business journals in the IB field, as well as the reference sections of the already identified articles for further articles.

This literature review advances IB theory in three ways: First, it gives a comprehensive overview of established findings regarding the integration of digitalization into the internationalization literature. Second, it carves out existing inconsistencies and contradictions that inform potential gaps and shortfalls in existing IB theories. Third, it offers a detailed agenda for future research directions in order to advance the integration of the new digital reality into IB theory. Lastly, this paper provides essential implications for managers of multinational companies by furthering their understanding of the interplay between digitalization and internationalization. Thereby, we provide valuable practice insights into how digitalization can be leveraged to improve internationalization performance and how to design and implement digital internationalization strategies.

# INFLUENCE OF RELIGION ON INTERNATIONAL MARKETING. A SYSTEMATIC REVIEW

Campo, Raffaele<sup>1</sup>; Rosato, Pierfelice<sup>2</sup>

<sup>1</sup>University of Bari, Italy

<sup>2</sup>University of Salento, Italy

## ABSTRACT

## INTRODUCTION

The effects of religion on consumer behavior have been explored by various studies. Mathras et al. (2016) define four dimensions of this relationship: beliefs, rituals, values, and community, while Agarwala et al. (2019) highlight that faith affects some behaviors linked to materialism, intolerance, ethics, risk aversion as well as consumer attitude toward religious products and economic shopping behavior. Brammer et al. (2006) stress that religious subjects have a broader conception of social responsibility of companies, while Raimi et al. (2013) underline that the three monotheistic religions' (Christianity, Islam and Judaism) ethics and values could represent important elements to develop CSR actions; similarly Cornwell et al. (2005) analyzed, in cross-cultural study, differences in idealism and relativism among Christian, Muslim and Buddhist consumers. Marketers have to pay attention to religion precepts especially in international marketing perspectives: for example in Judaism, Islam, Hinduism and Buddhism certain kinds of food are forbidden (it is sufficient to think about pork meat for Muslims) while Christianity does not limit food consumption (Sack, 2001). Moreover, similarly, study by Pettinger et al. (2004) reveal the impact of religion on consumer behavior, in particular on food choices. The relevance of faith on consumers' choices is further shown by the existence of certifications such as Halal for Muslims and Kosher for Jews, which are essential to drive religious consumers to purchasing choices consistent with religion principles. Recently Mahbubi et al. (2019) studied Muslim clusters about meat consumption in Indonesia, finding four characteristics which are more required by these consumers, that are sanctity, clarity, quality and safety: marketing implications are clear, for example the cluster who paid more attention to sanctity prefers this order of attributes: red color, flavor, fibrous, a halal label placed in front on the top of the packaging, clean, zero contamination, latest production.

## OBJECTIVES

This study is aimed at exploring through a systematic review the state of the art of scientific literature with regards to the impact of religion on consumer behavior in an international marketing perspective.

This is an ongoing research that will be organized in three main sections, as in Tracey (2012): a first part dedicated to reviewing literature on religion and consumer and companies attitude; then reviewing systematically the most relevant articles on religion present on international marketing journals; finally directions for future research will be proposed. This methodology is particularly suitable because it allows “to identify, select, critically evaluate and synthesize extant literature in a rigorous, transparent and replicable manner, leading to robust conclusions about what is known and not known in the reviewed research area (Vrontis and Christofi, 2019).

## SUMMARY OF THE SYSTEMATIC REVIEW

The keywords we selected for this aim are: religion and international marketing. At this step platforms used to search for this relationship in literature were Science Direct and Web of Science. The whole numbers of publications found are 5,737, including journal articles, books and conference proceedings. Most of them are written in English (4,055), followed by French (127) and (31) and Portuguese (8). In terms of publication types they mostly belong to journals (4,273), chapters (1,458), books (4) and conference proceedings (2). This is the list of journals most represented, interestingly tourism ones are the first ones.

*Table 1: Most represented journals*

| Journal                         | Number of articles |
|---------------------------------|--------------------|
| Annals of Tourism Research      | 180                |
| Tourism Management              | 172                |
| Journal of Business Research    | 121                |
| World Development               | 97                 |
| Business Horizons               | 92                 |
| Social Science & Medicine       | 85                 |
| Long Range Planning             | 67                 |
| Public Relations Review         | 66                 |
| Tourism Management Perspectives | 58                 |
| Futures                         | 55                 |
| International Business Review   | 52                 |

As shown in Table 1, pure marketing journals are not present in this “top 10” list; they are represented, after 20th place by Journal of Destination Marketing & Management (29 articles), Industrial Marketing Management (27), Journal of Retailing and Consumer Services (24) and International Journal of Research in Marketing (24). First three authors in terms of contributions are James D. Wright, John Swarbrooke and Paul B. Baltes. Production of publications is balanced throughout the years (recently the most represented years are 2019 with 340 articles and 2018 with 318). Countries more involved in these publications are China and India.

**Gaps:** In current literature marketing journals are little represented. Moreover this systematic review represents the first one to highlight the relationship between religion influence in an international

perspective. In the past similar systematic reviews have deepened the relationship between religion and food consumption (Naeem et al., 2019) or between religion and sport (Waller, 2016) but no with international marketing.

## PROACTIVE RESILIENCE IN WOMEN-LED WINERIES

Casprini, Elena; Pucci, Tommaso; Zanni, Lorenzo

Department of Business and Law, University of Siena, Siena, Italy

### ABSTRACT

Resilience, commonly understood as “an attribute that defines individuals who are able to thrive with difficulties and uncertainties and to feel better after something unpleasant happens” (Conz and Magnani, 2019: 1), is a characteristics that increasingly important in this fast-changing and uncertain world (Branicki et al., 2019). However, as recent literature reviews on the theme (Conz and Magnani, 2019; Linnenluecke, 2017) points out, resilience is not a one-size-fits-all-concept, but it is heterogeneous. For example, Conz and Magani (2019) have distinguished among four categories of resilience based on when the event occurs: resilience as a proactive attribute (before event occurrence), resilience as absorptive and adaptive attributes (during event occurrence), resilience as reactive attribute (after event occurrence), and resilience as dynamic attribute (before, during and after an event).

This paper focuses on proactive resilience, i.e. “an attribute that firms possesses before an event occurs” (Conz and Magnani, 2019: 5), and advances the concept arguing that proactive resilience is made up by two dimensions: a first, inward looking dimension, referring to the willingness of the firm to survive in the long run and a second, outward looking dimension, referring to the attitude of the firm to be environmentally sustainable.

The paper investigates the antecedents of proactive resilience disentangling the impact of two different firms’ sets of goals, namely quantitative (i.e. search of higher turnover, higher profit, more employees and new markets) and qualitative (i.e. being innovative, reinforcing the brand, reinforcing the relationship with other firms and improving the quality of the products/services) growth goals, and looking at these relationships in women- and non-women-led businesses. In fact, lot of studies have shown that gender diversity influences entrepreneurial process (Morris et al., 2006), business behaviors, processes and outcomes (Buttner and Moore, 1997; Danes and Olson, 2003; Danes et al., 2009; Nielsen and Börjeson, 2019; Stanford et al., 1995).

In advancing our hypotheses and conscious that resilience has been studied from different theoretical angles (Linnenluecke, 2017), we moved from the goal setting theory according to which an individual set a goal and this influences the effort in accomplishing that goal and, in turn, performance (Locke, 1996) and we test the following hypotheses:

*Hypothesis 1: Quantitative growth goals will positively influence proactive resilience*

*Hypothesis 2: Qualitative growth goals will positively influence proactive resilience*

The sample of this study consists of 167 questionnaires that were collected between June and December 2019. The questionnaires were sent to 800 wineries that belonged to a Wine Association at the Italian level.

The results of the path analysis show that different goals types influence resilience on the basis of whether the business is women- or no-women-led. More precisely, in women-led businesses, quantitative growth goals positively influence the proactive resilience, while in non-women-led businesses, only qualitative growth goals matter. Post-hoc analysis was also performed on individual-level characteristics.

This study presents a threefold contribution shedding light on the scanner investigated proactive resilience (Conz and Magnani, 2019), distinguishing between qualitative and quantitative goals growth and shedding light on two individual-level characteristics that might influence resilience (i.e. having previous work experience and entering the business due to passion or partner).

Limitations are linked to the fact that we talked about women- and non-women-led (not owned) businesses and we focused on Italian wineries. Future research, for example throughout longitudinal case studies, might investigate whether proactive resilience leads to resilience and study the phenomenon in different sectors and countries.

## MERGERS AND ACQUISITIONS – A STUDY ON VALUE CREATION

Costa, Joana<sup>3</sup>; Pereira, Adalmiro<sup>1</sup>; Vaz, Ângela<sup>2</sup>; Mota, Carlos<sup>1</sup>; Silva, Eduardo<sup>1</sup>

<sup>1</sup>Management, ISCAP-PPorto, CEOS member, Porto, Portugal

<sup>2</sup>ISCAP-PPorto, Andrade & Brandão, Lda member, Porto, Portugal

<sup>3</sup>ISCAP-PPorto, Porto, Portugal

### ABSTRACT

Value creation is the primary objective of any company, together with the creation of wealth for its owners, which can be achieved through mergers and acquisitions. In this way, the theme is related to the identification of the particularities that lead to the creation of value as well as the indicators that provide value creation in the process of mergers and acquisitions. The research theme was defined as “Mergers and Acquisitions – A Study on value creation”.

The acquisition process (total or partial) of a company comprises the following aspects:

- 1) Determination of the transaction value, which corresponds, in the acquired company, to the acquisition cost;
- 2) Determination of the global fair value of the acquired company's identifiable assets, liabilities and contingent liabilities, whether the same terms or not of the financial statistics;
- 3) Accounting treatment as given to a possible difference, positive or negative (goodwill and badwill), less the previous two values.

Thus, the work has as its main question “How do Mergers and Acquisitions influence the value of companies? ”.

The main objective focuses on assessing whether mergers and acquisitions positively or negatively affect the value of companies. Therefore, the secondary objectives are to mention the particularities that provide the increase in the value of companies; analyze performance indicators as measures to increase companies' value; identify the determinants that provide value creation.

With regard to methodology, this is a quantitative research, more specifically a statistical study, consisting of a relevant sample of Portuguese companies in order to analyze the evolution of the value of companies before and after the economic operation, which the indicator / indicators that have a greater relevance in changing this value.

The contribution of this work translates into the identification of the variables that contribute to the creation of value through mergers and acquisitions, as well as clarifying the role of the selected performance indicators in the increase of companies' value.

*Keywords: Mergers; Acquisitions; Value creation; Performance; M&A.*

# **AN OVERVIEW ABOUT THE KPI USED BY BUSINESS ORGANISATIONS TO MONITOR THE DIGITAL PROCESSES**

**Crocco, Edoardo; Chiaudano, Valentina**

Department of Management, Università degli Studi di Torino, Scuola di Management ed Economia, Torino, Italy

## **ABSTRACT**

The phenomenon of digitalisation strongly affected business organisations that become more and more digitalised to survive in today's competitive market.

The purpose of this research is to understand the existing literature about KPIs that business organisations used to monitor the new processes introduced with advent of the digital technologies inside the company.

The study uses Web of Science as a primary search engine and covers the most cited articles over the period 1997-2019. The records are statistically analysed using an open source software package called R.

The findings show how the literature is very diverse when it comes to this topic, as Digitalisation is affecting the Benchmarking processes of a variety of firms, from many different sectors. Our data confirms how the annual literature production has been steadily increasing over the years, up until 2019. This goes to show how the field is still evolving (Ohiomah et al., 2019). Based on our survey, "Performance" appears to be the keyword with the highest citations.

## **1. INTRODUCTION**

### **1.1 The current situation**

In recent years, the use of new technologies has affected business organizations, with more and more analogic businesses becoming digitalised in order to survive in today's competitive market (Kumar, 2018). The digitalisation is a structural change for not only a single business unit but for entire organizations, as for them is the only way to remain competitive. Especially, key strategic functions such as marketing, accounting and human resources can now benefit from new tools and techniques which allow them to be more efficient although they have changed their operational model (Kumar, 2018).

However, despite the importance of digitalisation in modern day economy, the literature is still lacking when it comes to researches related to the application of technology for businesses (Ohiomah et al., 2019).

### **1.2 The Proposed Study**

This study aims to analyze the state-of-the-art of the scientific literature as for how digitization affects process management in organizations, and particularly the KPIs that organizations adopt to monitor processes that are being digitalized. In particular, the focus is on specific keywords found in the literature, how often they come up when analysing the citations and whether or not there is a correlation between the numerous elements connected with Digitalization. We explore the existing theories and case studies in an effort to find common themes and ideas.

Moreover, our intention is to find specific keywords with the highest amounts of citations through a bibliometric analysis, in an effort to map the existing theoretical framework which appears to be fragmented and still relatively new (Ohiomah et al., 2019). In addition, our research maps the articles found based on the industry sector related to them, showing which industry sector is the most affected by the Digitalisation process and which one isn't.

### **1.3 Research Methods**

As affirmed by (Fink, 2019), the systematic literature consists of reviewing an existing body of literature using a clear and reproducible methodology.

In this study we use the PRISMA guidelines to develop our reporting strategy. (Moher et al., 2010)

We selected paper published from 2002 to 2019 on Web of Science. The choice of Web of Science of our sole citation database depends on the overlaps among the journal lists of Web of Science and Scopus and some other major scientific databases. (Gavel and Iselid, 2008)

On Web of Science database, we used the following search terms in title and abstract:

(i) digital\*

OR

(ii) KPI\* OR benchmark\*

The use of above-mentioned search terms and Boolean Operators on Web of Science gave us 4032 results. We then refined our research by limiting the results obtained in four specific fields: business, business finance, management, operation management, economics. This filter yielded 122 records. Then we filtered the result once again and excluded proceedings from the research obtained 85 articles and we make sure that all the articles were written in English (Kraus et al., 2020).

The next step was to manually screen the papers and filter out those that were not involving the topic of digitalization, KPI and benchmarking in them. This was achieved by analysing each title and abstract through the reference management software Mendeley. Finally, we exported the archive in a file that was readable by Bibliometrix. We then used R and its Bibliometrix tool to analyse the dataset obtained and extract the results discussed later in this paper.

## 1.4 Structure

The paper first focuses on defining the terminology that is going to be used in the paper screening process. Then it shows the methodology adopted, focusing on the various steps that led us from the first batch of 4022 papers to the final selection of 69. We then show how the data were analyzed through the Bibliometrix tool.

## 2. RESULTS

### 2.1 Annual Scientific Production

In an effort to demonstrate how the field of Digital Innovation is new and rapidly growing, we analysed the annual scientific production throughout the years, starting from 2002 to 2019. The production of content related to KPIs and Benchmarking tools in the Digital Age has been growing exponentially since 2002. The average annual growth rate is 11.33%. There has been a recent spike in production levels starting from 2015, with an annual growth rate of 80% from 2015 to 2019.

### 2.2 The most common Keyword

The three most common Keywords found in studies associated with Digital KPIs and Benchmarking are "Performance", "Systems" and "Framework", with "Performance" being the most common one. "Model", "Growth", "Innovation" and "Consumer" are also commonly used keywords.

### 2.3 Co-occurrence network

The Keywords co-occurrence network analyses the structure of a scientific field in an attempt to find existing links between keywords in the literature (Zarei and Jabbarzadeh, 2019). From our analysis, there appears to be strong connection between the words "Management", "Adoption" and "Framework". The same thing can be said about the cluster made of the keywords "Performance", "Systems", "Benchmarking" and "Efficiency".

## 3. CONCLUSIONS

The digitalization process is affecting the way KPIs are measured in modern day businesses. The present study has concluded how, despite the field being relatively new and still in development, there has been a steady growth in the annual production rate over the past five years. The strict connections between the keywords "Framework", "Management", "Performance" and "Efficiency" suggests illustrates the increasing trends in the literature concerning the Digital Age.

*Keywords: digitalisation, KPI, benchmarking, digital transformation, management*

## RELATIONSHIP BETWEEN UNIVERSITIES AND WINE COMPANIES: THE CASE OF TASCA D'ALMERITA

**Cutugno, Mariapia; Abbate, Tindara; Cesaroni, Fabrizio**

Department of Economics, University of Messina, Italy

### ABSTRACT

#### OBJECTIVES

In recent years, universities have focused their attention on improving and increasing their relationship with industry, with the ultimate goal of promoting regional and national economic development and innovation systems (Etzkowitz & Leydesdorff, 2000; Giuliani & Arza, 2009; Cesaroni and Piccaluga, 2016). Hence firms' ability to acquire, use and integrate external sources of knowledge has been recognized as one of the most relevant competitive factors, in particular for companies that adopt an Open Innovation approach (Chesbrough and Crowther, 2006; Spithoven, Clarysse and Knockaert, 2011).

However, this phenomenon of closer university-industry relationships has mainly affected high-tech companies, while low-tech companies often lack the needed resources and competences to take advantage of university knowledge and skills (Goedhuys, M., Janz, N. & Mohnen, P., 2013; Giuliani, E. & Arza, V., 2009). Despite the importance of low-tech companies, especially in certain countries such as Italy, prior literature has often neglected to address the phenomenon. Accordingly, this work aims to explore in depth the relationships that can be established between the academic world (universities) and low tech SMEs, when the latter have the need to internally implement innovative practices, given that this type of company often suffers of weaknesses in skills to pursue this type of strategy.

Specifically, the analysis will address the wine making industry. Indeed, wineries have expressed the need to maintain their competitive advantage, and to innovate, even though they are aware of the lack of knowledge in areas other than the mere production of wine. In fact, companies in the low-tech industries often lack effective absorption capacity (Cohen & Levinthal, 1990; Spithoven, Clarysse & Knockaert, 2011), which is necessary to exploit external knowledge in order to develop innovations (of various types) and finally converting innovation into financial performance (Dahlander & Gann, 2010; Rothaermel & Alexandre, 2009, Vrontis, D., Thrassou, A., & Rossi, M. 2011). Universities are one of these external sources of knowledge. Businesses can benefit from the scientific and technological knowledge offered by academic institutions and use them for their innovation purposes (Natalicchio et al., 2019).

## **METHODOLOGY**

To pursue the objective of this paper, the study performs a qualitative analysis based on the single case study method, which allows an in-depth exploration of the phenomenon (Yin, 2004), by utilizing a wider range of data sources. The case here selected is Tasca d'Almerita, a winery that operates in the Sicilian territory. This firm began its activity in 1830 and over the years has distinguished itself for the implementation of innovative practices throughout the production chain and not only in this area. Our choice fell on this Sicilian company because it was one of the first to see an opportunity for development in the university-business relationship. Precisely for this reason, in recent years, it has established long lasting relationships with Italian and European universities. The data collected derives from both primary data (semi-structured interviews) and secondary data (desk analysis, internal reports and documents, dossiers and other printed materials).

## **FINDINGS**

Results of the qualitative analysis (in-depth case study) show that even low-tech companies (an example of which is Tasca d'Almerita) are increasingly trying to strengthen interactions with universities, because they realize the internal limits that the wine production can have (routine of farmers, winemakers, etc.), for the internal implementation of innovative practices that can make the production and marketing of wine easier and more attractive. Furthermore, they are making efforts to overcome internal and external communication obstacles that characterize these types of cooperation: often the implementation of internal changes are contrasted by the psychological and attitudinal limits of internal employees and collaborators. In this specific case, internal farmers are expected to face a change in mentality, a very difficult action to implement, being farmers a little fond of traditional practices.

## **RESEARCH LIMIT**

The study carries within itself the limits common to any qualitative analysis and, not having the pretension to be exhaustive in the explanation of the phenomenon under examination, it lays the foundations for further future research.

## **PRACTICAL IMPLICATION**

The results of this study have practical implications that can be useful to managers operating in low-tech sectors. The opening up of the innovation processes of these kinds of firms, however, by

improving the relationships with external sources, can allow them to obtain information and knowledge that were previously very distant and eventually improve their innovative outcomes.

# DETERMINANTS OF SUCCESSFUL GOVERNMENT INVOLVEMENT IN THE RESTRUCTURING OF LARGE COMPANIES: A HYBRID APPROACH

Danovi, Alessandro; D'Amico, Alessandro

Department of Management, Economics and Quantitative Methods, Università degli Studi di Bergamo, UNIBG, Bergamo, Italy

## ABSTRACT

## INTRODUCTION

The COVID-19 pandemic is triggering a wide-spread economic crisis: European member States, backed by the European Central Bank, are already stepping in to facilitate the restructuring process of both the corporate and financial sector. In such a time, governments enjoy a high degree of freedom in terms of resource reallocation. We believe a discussion concerning the best practices of government intervention could be of public interest.

An in-depth literature review on the topic shows four main kinds of government intervention in the restructuring of the economy. Based on the most frequent elements of the different, although mostly comparable, theoretical frameworks, the government's role can be classified along two axis: kind of activity (regulation/ intervention) and scope of action (market-wide/ firm-specific).

This work is particularly focused on the restructuring process of large non-financial strategic firms, i.e. instances of firm-specific interventions. We analyse several case studies from the past global financial crisis and integrate our observations with industry-level data. We adopt this hybrid approach to draw insights into which factors differentiate successful and unsuccessful government-driven attempts at restructuring large firms. The main selected cases are: the US automobile industry under the Troubled Asset Relief Program (TARP), the Ukrainian state-owned energy company Naftogaz; Dubai World, a real estate company related to the United Arab Emirates government; and AvtoVaz, a partially state-owned Russian car manufacturer.

## METHODOLOGY

We assess each case's policies' effectiveness by observing both the economic performance of the selected firms and that of their respective industries as a whole, and comparing it to the policies' cost in terms of GDP percentage. The firm-level data is retrieved from the Bureau Van Dijk Orbis database, whereas the policies-related information is mostly extracted from International Monetary Fund's reports. Then, we speculate on the determinants of a successful restructuring, based on the following

variables: ownership structure (privately/ state-owned), profitability prior to the crisis, and duration of the government's presence in the ownership structure.

## CONCLUSION

At the time of writing, research is still ongoing. However, government-driven restructuring seems to have proven effective, at least to some extent, only in the context of the Troubled Asset Relief Program. In other words, State intervention worked only on firms that were solvent prior to the crisis, with plenty of cash reserves, and with a clear exit-strategy in place.

Limitations of this study include the lack of transparency on some of the enacted policies, a skewedness of the sample towards non market-oriented economies and a difficulty in separating a policy's effects from the overall trend of the economy. The next steps in the research process will address these shortcomings by expanding the sample of observed cases with instances from European member states.

## GREEK FIRMS' CAPITAL STRUCTURE AND THE CRISIS

Dimitropoulos, Panagiotis; Koronios, Konstantinos

Department of Sport Organization & Management, University of Peloponnese, Sparta, Greece

### ABSTRACT

### INTRODUCTION

The onset of Greek debt crisis can be traced to the U.S. sub-prime crisis in 2007 (Arghyrou and Tsoukalas, 2011). Greece is severely suffered in this crisis, having its rating in 2015 dropped to B- (S&P), Caa3 (Moody's), CCC (Fitch). Moreover, its GDP shrank about 25% over the period of 2010-2015, accompanied with nearly 25% unemployment (roughly 60% youth unemployment) and high ratios of debt to GDP, which were 177% for public and 142% for foreign debt. Also, the capital market was frozen and bank lending mitigated, facts that affected the capital structure of Greek firms (Chatzinas and Papadopoulos, 2018). This paper aims to investigate the firm-specific determinants of capital structure of Greek non-listed firms before and after the period of debt crisis. In addition, this paper intends to study whether the firm-specific determinates of capital structure and their effects on leverage will differ across those two sub-periods. The first motivation of this paper is the special macroeconomic environment of Greece during the period of crisis (Daskalakis et al., 2017; McNamara et al., 2017). Furthermore, studies published on the Greek business setting either investigate the behaviours of Small and Medium-sized Enterprises (SMEs) or select a different period of time, most of which do not focus on firm-specific factors (Noulas and Genimakis, 2011; Balios et al., 2016). Moreover, the current study extends the previous work by Chatzinas and Papadopoulos (2018) and Kyriazopoulos (2017) by including a largest sample (almost the majority) of non-listed, non-financial corporations in Greece and not focusing only on listed firms as the previously mentioned studies. Moreover, we include a large sample period even before the US financial crisis of 2007-2008, thus we are able to extract more efficient inferences regarding the impact of firm-specific determinants on the capital structure.

### METHODOLOGY

The sample of this study includes all private, non-listed corporations registered in the Greek chamber of trade during the period 2003-2016. All data were extracted from ICAP database. We collected data from firms' annual financial statements which closed their fiscal year on December and have full financial data for at least four consecutive years. Meanwhile, due to the different structures of balance sheet between firms in financial industries and nonfinancial industries, firms in financial sectors are

excluded from the sample data (Chen, 2004). This procedure resulted in a usable unbalanced sample of 8529 firms summing up to 30041 firm-year observations.

Complying with most of the previous studies on capital structure, panel data will be estimated through the Ordinary Least Squares (OLS) and multivariate linear regression model to investigate the firm-specific determinates' impact on firm's capital structure decision. The basic regression model can be specified as follows:

$$TLEV_{it} = \beta_0 + \beta_1 SIZE_{it} + \beta_2 GROW_{it} + \beta_3 PROF_{it} + \beta_4 EVOL_{it} + \beta_5 TANG_{it} + \beta_6 NDTs_{it} + \beta_7 TAX_{it} + e_{it}$$

Where  $i$  denotes the firm dimension and  $t$  denotes the time dimension. The dependent variable TLEV (total liabilities to total assets), represents the leverage level of the  $i^{\text{th}}$  firm in  $t^{\text{th}}$  year,  $\beta_k$  is the regression coefficient for the  $k^{\text{th}}$  independent variable, SIZE, GROWTH, PROF, EVOL, TANG, NDTs and TAX, represent the firm size, grow opportunities, profitability, earnings volatility, asset tangibility, non-debt tax shields and income taxes of the firm  $i$  during period  $t$  respectively,  $\varepsilon_{i,t}$  denotes the error term for the  $i^{\text{th}}$  firm in  $t^{\text{th}}$  year. Model (1) will be estimated by random effect since the Breusch and Pagan Lagrangian multiplier test for random effects produced a highly significant chi-square value suggesting that random effects is the most efficient estimation method.

## RESULTS AND DISCUSSION

Results are presented on Table 1. This study tests the efficiency of trade-off theory and pecking order theory, finding that size and asset tangibility are directly and positively related to total leverage, while growth opportunities, profitability, earnings volatility, non-debt tax shields and tax payments are negatively and significantly impacting total leverage. Finally, only earnings volatility seem to have a differential impact on both total and long-term leverage between the pre and post-crisis periods. This paper enriches the existing studies related to capital structure and provides new empirical evidences for the capital structure theories within a country that experienced a severe reduction on its economic activity for a significant time period. Meanwhile, this paper helps to fill the gap in existing literatures, since few previous researches have studies the capital structure determinates of Greek listed firms during a large time period before and after the crisis period (with Daskalakis et al., 2017 being the only exception). This study has important implications for regulators and investors. Regulators could use the findings of the current study in order to adjust state policies (tax policy, financing policy etc.) for assisting firms to access financing in difficult times, while investors should consider the differential impact of capital structure determinants during troubled times when receiving their financing and investment decisions.

Table 1: Panel random effects regression results on the determinants of total leverage before and after the crisis (robust standard errors).

## CORPORATE SOCIAL PERFORMANCE AND INCOME SMOOTHING

**Dimitropoulos, Panagiotis; Koronios, Konstantinos**

Department of Sport Organization & Management, University of Peloponnese, Sparta, Greece

### ABSTRACT

### INTRODUCTION

In prior literature, accounting information quality is measured through various proxies the most popular being that of earnings management and specifically income smoothing (Niu, 2006). Income smoothing commonly refers to managerial activities aiming to influence positively their bottom-line earnings (net profits) so as to avoid reporting small losses and report small positive income (Dimitropoulos, 2011). Under this framework, several research studies have considered the impact of CSR related activities and performance on the quality of financial information published by firms. One strand of literature (agency theory perspective) argues that CSR is negatively associated with IS because CSR mitigates the agency problems within firms by reducing the managerial incentives to exercise accounting discretion over financial reports. High CSR performing firms are more likely to restrain income smoothing behaviour (Choi et al., 2018). The other strand of the literature, documents that CSR and income smoothing could be positively associated because CSR could be used as a vehicle for window-dressing the true economic condition of the firms (political cost hypothesis) (Kim et al., 2012).

Empirical evidence so far have yield conflicting evidence on the impact of CSR on earnings manipulation. Prior et al. (2008) and Buertey et al. (2019) provide evidence of a positive association between CSR and earnings manipulation supporting the political cost hypothesis. On the contrary, Choi et al., (2018), Yoon et al. (2019), Kim et al. (2019) and Palacios-Manzano et al. (2019) all point to a negative association between CSR and earnings management. The scope of this paper is to shed further light on the impact of CSR performance and its components on income smoothing behaviour by incorporating a multi-country research setting (24 EU countries) and incorporating various sub-categories of social performance, thus providing more thorough evidence in the existing literature regarding the impact of CSR on the quality of accounting numbers. This is the first study in European level which considers the multi-facet characteristics of CER on the quality of accounting earnings and offers useful policy implications for regulators and investors.

### METHODOLOGY

The current chapter utilizes a sample of corporations (both listed and unlisted) from 24 EU-member countries over the period 2003 – 2018. All financial, governance and environmental responsibility data have been extracted from Datastream database. The sample collection procedure started by including all corporations that have been covered by the environmental, social and governance (ESG) scores provided by Datastream during the sample period. We ended up with a final sample of 121154 firm-year observations. In order to examine the main research hypothesis we measure the level of earnings manipulation by income smoothing, following previous studies by Leuz et al. (2003) and Barth et al. (2008). Income smoothing is estimated by the Spearman correlation between accruals and cash flows between firms of high, medium and low CSR performance. CSR performance is the firm annual average of five social responsibility scores referring to CSR strategy score, work force score, human rights score, community score and product responsibility score. All social variables scores range between zero (0) and 100 so the higher the score the more socially responsible and efficient is the firm. High CSR firms are those that their CSR score is above the 3rd quartile, low CSR firms are those that their CSR score is below the 1st quartile and firms with CSR scores between the 1st and 3rd quartiles are denoted as medium CSR performing firms. Barth et al. (2008) interpret a more negative correlation between accruals and cash flows as earning smoothing due to the fact that managers respond to poor cash flow outcomes by increasing accruals (through the increase of net income since accruals are the difference between net income and operating cash flows). If this is true we predict that firms with higher CER performance will present a less negative correlation between accruals and cash flows compared with medium and low CER firms, thus will be associated with lower income smoothing.

## EMPIRICAL RESULTS

Results are presented on Table 1. As we can see, the Spearman rank correlation coefficient increases in magnitude moving from the P1 portfolio of the high CSR performing firms (-0.649) to the P3 group of low CSR performing firms (-0.891). This result provides support to H1 indicating the firms engaging in CSR activities are associated with higher accounting quality through less income smoothing.

*Table 1: Income smoothing based on CSR ranked portfolios.*

| <b>Spearman correlation</b> | <b>P1 – High CER</b> | <b>P2 – Medium CER</b> | <b>P3 – Low CER</b> |
|-----------------------------|----------------------|------------------------|---------------------|
| <b>Coefficient</b>          | -0.649***            | -0.844***              | -0.891***           |
| <b>p-value</b>              | 0.001                | 0.001                  | 0.001               |

**Note:** \*\*\* indicate statistical significance at the 1% significance level.

## CONCLUSIONS

The scope of this chapter was to provide evidence on the impact of CSR performance on the income smoothing behaviour by utilizing a multi-country research setting and incorporating various sub-categories of social responsibility performance and income smoothing measures evidenced in the accounting literature. The empirical results verified evidence and arguments in the literature that CSR performance improves the quality of published accounting information by mitigating income smoothing. The negative association between CSR performance and earnings management could be used by investors in assessing the risk of firms and the quality and reliability of financial information.

# NEW SERVICE DEVELOPMENT FOR AND FROM EMERGING MARKETS: A SYSTEMATIC REVIEW AND FUTURE DIRECTIONS

Dubiel, Anna; Mukherji, Prokriti

Marketing Subject Group, King's Business School, King's College London, London, UK

## ABSTRACT

## INTRODUCTION

In the last decade emerging markets (EMs) have become an established part of the world's economic landscape (Dubiel and Ernst, 2013; McKinsey, 2018). With buoyant local consumption they are increasingly attractive markets and a crucible for innovation exported overseas (Zedtwitz *et al.*, 2015). Yet, due to infrastructure issues, regulatory frameworks, and customer solvency, entry into EMs remains challenging for firms from developed markets (DMs) (Nagy *et al.*, 2020; Vassallo *et al.*, 2019). Similarly, firms from EMs experience difficulties in targeting DMs. New product development (NPD), a core driver of market success, is one such aspect where both perspectives are especially visible. Thus, firms report an array of failed attempts to meet customer needs in both EMs and DMs (Dubiel and Ernst, 2013; Zedtwitz *et al.*, 2015). Therefore, insights on how to develop successful new offerings for EMs or by EMs firms while avoiding pitfalls of simply extrapolating from DMs to EMs are in high demand. We take stock on existing research on this timely matter and address the knowledge gap lying at the intersection of two major marketing domains, i.e., international marketing and NPD.

More specifically, existing research on NPD-related questions focusses mainly on manufacturing firms and tangible products (Agarwal *et al.* 2017; Dubiel and Ernst, 2013; Zedtwitz *et al.*, 2015). This is a major shortcoming on two counts: 1) services are fundamentally different from tangible products (Papastathopoulou and Hultink, 2012) and thus their development processes differ substantially (Storey *et al.*, 2015); 2) services contribute greatly to EM economies, by accounting for 60 percent of GDP and more than half the total jobs (McKinsey, 2018). Services in EMs are varied, ranging from micro-loans at the bottom-of-the-pyramid (Vassallo *et al.*, 2019) to shopping mall (Diallo *et al.*, 2018). A more granular understanding of development and launch of new services in the context of EMs is decisive for advancing theoretical and practical knowledge in marketing. To the best of our knowledge, this is the first comprehensive overview of research into new service development (NSD) in the context of EMs. Our review contributes to a systematic and critical examination of extant literatures further highlighting possible novel and impactful research avenues for future exploration.

## METHODOLOGY

We adopt a systematic review methodology (Christofi *et al.*, 2017). The central questions we ask are “What is the extant research in marketing and NPD on NSD and how is this field likely to evolve?” We focused our search efforts on EBSCOhost Business Source Complete and Science Direct spanning 2010-2019. The initial search was conducted using the search strings: “service” and “emerging market” in titles, keywords, and abstracts to allow for a broad coverage minimising exclusion of potentially relevant studies. We have focused on academic journals rated ABS 3 and above as well as some highly regarded managerial outlets (e.g., Harvard Business Review), to account for the applied nature of the subject. We selected higher ranked journal articles primarily to uncover up-to-date findings from reliable sources but also return a manageable list of references (Paul and Criado, 2020). Our search has yielded 22 manuscripts so far.

## THEMATIC ANALYSIS

Our initial thematic analysis identifies three main research themes (see Table 1 for examples).

Table 1: Findings of exemplary reviewed papers

| Authors, Year, Journal                                    | Industry                                     | Method  | Location  | Service direction             | NSD success factor | Profit Y/N                                    | Market segment | Major research focus         | Major research findings  |   |
|---|--|---|---|-------------------------------|--------------------|---|----------------|------------------------------|--|---|
| How to develop new services                               |  |   |   |                               |                    |   |                |                              |  |   |
| 1   | Vassallo <i>et al.</i> , 2019, <i>JPIIM</i>  | Microfinance  | Secondary sources/questionnaire                                       | India                         | EM<->EM            | Organisational design                         | Y/N            | BOP                          | Extent to which, alternative hybrid forms (not-for-profit, quasi-profit, and for-profit hybrids) drive social innovation. Relative propensity of these hybrid forms to drive social innovation under varying BOP market conditions | Quasi-profit hybrids have a propensity to become more prevalent and achieve greater usage in BOP markets overall. Not-for-profit hybrids are more likely to become more prevalent and achieve greater usage in markets with lower development levels, whereas for-profit hybrids are more likely to become more prevalent and achieve greater usage in markets with lower social diversity when compared with other hybrid forms<br>Consumers with an interdependent self-construal tend to have greater suspicion of and negative responses toward high service attentiveness. The effect of interdependent self-construal fostering greater suspicion is attributed to a sharper in-group (vs. out-group) distinction, which is mitigated when the service employee is perceived to be an in-group member |
| 2   | Liu <i>et al.</i> , 2019, <i>JIM</i>         | Hairdressing, telecommunications, and computer repair | Qualitative study, a field experiment, and two laboratory experiments | among others China            | EM<->EM            | Front-line staff involvement                  | Y              | Diverse                      | Can service attentiveness increase consumer satisfaction in different markets?   |   |
| New service characteristics/design                        |  |   |   |                               |                    |   |                |                              |  |   |
| 3   | Diallo <i>et al.</i> , 2018, <i>JIM</i>      | Shopping mall service                                 | Questionnaire   | Morocco, Senegal, and Tunisia | EM<->EM            | Quality and loyalty                           | Y              | Diverse                      | How cultural context affects the relationships between service quality and customer loyalty?   | Mail service quality and its specific dimensions affect customer loyalty through the positive mediation of customer satisfaction and mail perceived value. Differences between the surveyed countries apply.  |
| 4   | Govindarajan and Ramamurti, 2013, <i>HBR</i> | Health care services                                  | Cases, interviews   | India                         | EM<->EM->(DM)      | Organisational design, service innovativeness | Y/N            | Rather lower market segments | Understand how some Indian hospitals are able to provide world-class health care at ultralow cost  | Three powerful organisational advantages: a hub-and-spoke configuration of assets, an innovative way of determining who should do what, and a focus on cost-effectiveness rather than just cost cutting   |
| Internationalisation of service firms to emerging markets |  |   |   |                               |                    |   |                |                              |  |   |
| 5   | Ghauri <i>et al.</i> , 2014, <i>IMR</i>      | Finance, insurance, telecommunications                | Multiple case studies   | India                         | DM->EM             | External relations                            | Y/N            | BOP                          | How employing corporate social entrepreneurship and developing a network of relationships with NGOs can support and contribute towards the internationalisation of service firms into the BOP markets in EMs                       | The pursuit of corporate social entrepreneurship has paved the way for the MNCs to establish relationships with NGOs. While the MNCs have mainly had the technical knowledge and financial resources required, collaboration with NGOs have allowed them to learn about the BOP's specific needs and benefit from the NGOs' knowledge, HR and good relationships in this market   |

Note: *IMR* = *HBR* = Harvard Business Review; *International Marketing Review*; *JIM* = *Journal of International Marketing*; *JPIIM* = *Journal of Product Innovation Management*;

These are: 1) NSD success factors (e.g., staff involvement, organisational design), 2) New service characteristics (e.g. quality, innovativeness) and 3) Service internationalisation into EMs. Further, we observe some noticeable differences between countries (most studies in India and West Africa),

industries (interest in financial services), market segments (bottom-of-the-pyramid vs. middle class) and organisational forms (for profit vs. mixed vs. charitable causes).

## RESEARCH GAPS AND AGENDA FOR FUTURE RESEARCH

We propose three areas (theory, methods, and context) for future research. First, studies from the NPD domain tend to be less explicit about the theories applied, and a broader variety of theories would be encouraged to explain NSD practices in the EM context, thus enriching the research stream. Second, case studies seem to be the dominant method used. While the many difficulties related to large-scale data collection in EMs are acknowledged, future studies are very much encouraged to explore different methods (e.g., natural experiments, randomised control trials) to provide better insights into causality as well as understand relationships between phenomena located at different analysis levels (e.g., hierarchical linear modelling). Finally, concerning context a broader exploration of national settings and industries would improve our understanding of NSD in the context of EMs. Particularly, studies on the middle class and in B2B sectors are encouraged.

### ABSTRACT

The move from office-based to remote work can have different and even opposite effects on people's work practices and work outcomes, on their relationships with peers and on their work-life balance (Bartel *et al.*, 2012). These opposite effects have been attributed to structural conditions such as people's tasks, the properties of technology and the type of remote work arrangement (e.g. Drouin and Bourgault, 2013). However, a growing set of studies attributes these differences and contradictions to how people appropriate these structures (e.g. Fonner and Stache, 2012). Our research looks at an understudied process of appropriation in remote work: the process whereby people appropriate time-space to socially construct their workplace. Specifically, we addressed the following research question: How do people's answer to the question 'where do I work' shapes their transition from office work to remote work?

To answer to this research question we conducted a case study (Yin, 2017) in the Italian subsidiary of a multi-national company selling pneumatic solutions. To cut costs, the company introduced a remote work program for all the salesforce and removed all local offices. Only the headquarter in Milan remained as a physical space. Our main source of primary data was a set of 21 semi-structured in-depth interviews to salesmen in their transitioning process from office-based to home-based mobile working and to their supervisor. We interviewed people at two separate times: 1) immediately after salespeople transitioned from working at a desk in their local branch to home-based mobile teleworking; 2) and six months after this transition.

In contrast to most research on the social construction of workplace, the study took an ethic, rather than an emic approach to the spaces where people work (cfr. Halford and Leonardi, 2006). This means that the study allowed to account for different interpretations of work space, since the data collection strategy did not specify in advance or narrow the spaces that could become workplaces.

This approach allowed a plurality of meanings attached by salespeople to their workplace to emerge through the analysis. These included: the *industrial sector*, e.g. "I've always sold pneumatics, mainly pneumatics solutions (..); a *prestigious company* "Our company has recently been acquired by an important financial company (...). We don't know if they have a real intention to invest in pneumatics" (salesman 1); the *geographical area of competence*, e.g. "I'm like a micro-entrepreneur on a slice of

geographical area" (salesman 3); a (*unknown*) brand, e.g. "When I knock at the door of the client and say that I'm from Alfa (a pseudonym of the old company where salesmen worked), everyone knows me. Today I say I'm from PneumOne and the client answers "what?" (salesman 4); *everywhere*, e.g. "Our work can be done anywhere in the world. When you have the adequate tools, there is no need to be in a specific place" (salesmen 5); a *physical organizational space*, e.g. "Home is home, office is office" (salesman 6); the *customer site*, e.g. "Being a salesman, I've always spent time at the customers' sites" (salesman 7).

Introducing the social construction of the workplace makes two sequential contributions to research. First, it contributes to research on remote work by establishing a link between research on the structural conditions shaping remote work, such as the remote work arrangement and task, with the meaning that people attribute to their workplace and which will inform how they experience and enact the transition to remote work. Second, it shows how to address a prevalent challenge in research on IT and organizations: that is integrating the role of meanings with the role of practices in the explanation of the link between people's use of IT and the effects of IT in organizations. People's answer to the question 'where do I work' – which is their own interpretation of their workplace – can help improve the theory of how remote work changes people's practices and their consequences and show how meaning can be integrated with practice in explanations of the effect of IT in organizations and society.

## DILEMMAS OF CONTROL IN REMOTE WORK

Errichiello, Luisa<sup>1</sup>; Pianese, Tommasina<sup>1</sup>; Cunha, Joao<sup>2</sup>

### ABSTRACT

Remote work arrangements (RWAs), such as telework, mobile work and virtual teams, lead to major changes in the control of work (Bélanger *et al.*, 2013). However, existing studies reveal contradictory effects of RWAs on control. Some argue that RWAs increase control while others argue that RWAs decrease control over employees (e.g. Kurland and Cooper, 2002). The question is not whether there is more or less control in computer-mediated RWAs. Instead the question is how that control is produced, reproduced and enacted in practice as people cope with, and take advantage of opposing effects produced by RWAs on control. We first review organizational literature on control (see Long and Cardinal., 2020, for a recent review) to explore whether and how each form of control (e.g. direct supervision, standardization, mutual adjustment) are exercised in RWAs. Then, we analytically review empirical research on RWAs and control to address the described tensions. The authors show that control in RWAs is specified by the relationship between the tension between *directive* and *delegative* control on one side, and tension between *connective* and *protective* participation, on the other side.

Research on RWAs has discussed the role of both directive and delegative leadership practices in the control of teleworkers and virtual team members. In directive leadership practices, managers take upon themselves to enforce control over employees (Dambrin, 2004). Delegative leadership practices allocate part of the burden of control to employees themselves (Brocklehurst, 2001). There is a tension between these practices in RWAs because directive control practices need delegative control practices to work and vice-versa. However, delegative control practices can hinder directive control practices and vice-versa. Our analytical literature review shows that rather than choosing one or the other, managers can incorporate both sets of practices and attempt to address the challenges of doing so as they surface. The tension between these two types of leadership and their effect on control depends on the practices that managers use to navigate through these tensions.

Research on RWAs has shown how employees can enact connective or protective practices towards their organization, in responses to managers attempts at directive or delegative control. Connective practices make employees' work visible to the organization so as to increase their sense of belonging and to allow them to benefit from their relationship with their managers. Protective practices make employees' work invisible so as to increase their sense of independence from the organization and to

allow them to avoid direct supervision (Barsness *et al.*, 2005). The tension between connective and protective practices comes from the increased control that employees must pay to benefit from visibility. The outcome of the tension between visibility and invisibility is specified by employees' adaptive choices to address these conditions. In sum, our analytical review of literature reveals that level of control in RWA depends on the tension between *aggregation* and *disaggregation* which is enacted by the relationship between (a) managers' leadership practice (ie. their attempts at addressing the tension between directive and delegative leadership) and employees' distancing practices (ie. their attempts at addressing the tension between connective and protective participation in RWAs).

# EMPLOYEES' INTENTIONS TO IMPLEMENT GREEN PRACTICES IN HOTELS: THE INTERACTION OF GREEN ORGANIZATIONAL CLIMATE WITH ENVIRONMENTAL ATTITUDES AND BEHAVIOURS

Errichiello, Luisa<sup>1</sup>; Drago, Carlo<sup>2</sup>;

<sup>1</sup>Institute for studies on the Mediterranean (ISMED), National Research Council (CNR), Naples, Italy

<sup>2</sup>University "Niccolò Cusano", Rome, Italy

## ABSTRACT

Over the 21st century climate change, global warming, air pollution and resource shortages have pushed hospitality organizations to seriously address environmental sustainability in the conduct of their businesses and to adopt environmental management systems, eco-innovations and/or new technologies e.g. for lighting systems, water heating or air conditioning (e.g. Gössling *et al.*, 2010).

Previous studies (e.g. Chan and Hawkins, 2010; Chan *et al.*, 2014; Chan and Hsu, 2016) have pointed out that the environmental management programs imply new policies and procedures regulating employees' behaviour at work. These changes can be felt by employees as a threat, fear or even distrust in their managers' true intentions, thus leading them to resist to changing work practices and routines. Notwithstanding the relevance of the issue, studies investigating the relationship between environmental programs and employees' intentions to implement green practices in the hospitality industry is still underdeveloped and focused on the customers' and/or managers' perspectives (Chan and Hsu, 2016).

This study aims at contributing to research on environmental sustainability in the hotel industry by investigating the influence of *organizational green climate* (OGC) on the environmental attitudes and behaviour of hotels' employees. OGC refers to the employees' shared perceptions of the organizational events, policies, practices and procedures developed to sustain the "greening" of the organization (Chou, 2014). Drawing on previous research (e.g. Paillé and Raineri, 2015; Zientara and Zamojska, 2018) we assume that the organizational green climate: 1) is positively related to ecological behaviour (H1); 2) moderates the relationships between employees' environmental knowledge, environmental awareness and environmental concern and their ecological behaviour (i.e. the influence is stronger under a stronger climate) (H2, H3 and H4).

In order to test our hypothesis, we developed an ad hoc questionnaire based on 5-items scales used in previous studies (Chan *et al.*, 2004; Norton *et al.*, 2014). Respondents were asked to report their perceptions about the importance of attributes by rating each item on a 5-point Likert scale ranging from 1 = strongly disagree to 5 = strongly agree. Managers of hotels located in different touristic areas of Naples (Italy) were approached. Overall, 15 hotels decided to collaborate in the project. At the end of

the collection process, 350 usable responses from their employees were collected. Structural equation modelling (SEM) was used to test the research hypotheses.

This paper contributes theoretically by enriching existing research on environmental sustainability in organizations by shedding light on how a source of external social norms for organizational members (i.e. perceived green organizational climate) interact with internal individual beliefs and values (e.g. environmental knowledge) in shaping their behaviours and intentions. At practice level, it provides some strategic guidelines to hotel managers to enhance employee intentions to support the implementation of environmental programs by leveraging both individual-related and organizational-related factors.

# STRATEGIES FOR A MORE SUSTAINABLE HOME FOOD DELIVERY SYSTEM: THE CASE STUDY OF DELIVEROO

Galati, Antonino; Siggia, Dario; Crescimanno, Maria

Department of Agricultural, Food and Forest Sciences, University of Palermo, Palermo, Italy

## ABSTRACT

## INTRODUCTION

Several companies (restaurants, fast-food, super and minimarkets, etc.) today offer their customers the opportunity to buy food products online and to deliver them at home through food delivery distribution systems (Pan et al., 2017; Agatz et al., 2008). The food delivery sector is, in fact, assuming increasing importance in the distribution system of food products and food meals as it is becoming an ordinary component of consumption habits (Fooddelivery.report, 2020). Some data confirm the growing trend of this sector worldwide with a revenue that stands in 2020 at US\$136,431m, of which US\$70,741m attributable to the Platform-to-Consumer Delivery segment; a value that should reach US\$182,327 in 2024 (Statista, 2020). This growing demand for food delivery is driven by changes in consumption habits due to less time for food preparation and family meals (Kilcast and Angus, Eds. 2007) and consequently greater consumer attention towards the purchase of ready-made food using food delivery. The growth of the sector has inevitably affected the demand for freight transport, especially in urban areas, leading to an intensification of flows, deliveries and returns, with negative inevitable consequences on air quality (Ehrler et al., 2020). In terms of pollution, for example, the urban transport of goods produces about 27% of the total CO<sub>2</sub> emissions in the EU countries (EU, 2020). Therefore, with the increase of the food delivery demand, if on the one hand there is a reduction in the number of trips to shops and car trips of consumers, on the other hand, there is an intensification of travel drivers with significant implications on the structure of traffic and pollution in urban areas (Bjørngen et al., 2019). In line with this, it becomes essential to adopt more sustainable transport systems for food delivery in order to reduce the carbon footprint (Wygonikand and Goodchild, 2012). From this point of view, over the last few years, several projects, among which the EnerNETMob, an InterregMed project, they were financed to identify best solutions in order to guarantee of greater transport sustainability through the use of electric vehicles for urban transport. The introduction of electric vehicles for food delivery, such as e-bikes, e-scooters, e-cars, could undoubtedly contribute to reducing the environmental impact of the distribution of food purchased online. Despite the greater attention toward sustainable transport systems, studies analyzing the economic, environmental and social impacts of the adoption of electric vehicles for foods distribution

are still scarce. A recent study carried out in the German market on the potential extent of electric vehicles for the short-range distribution of food products underlines the validity of this more sustainable alternative but at the same time detects additional costs for companies that consumers are unwilling to support (Ehrler et al., 2020). L'originalità di questo studio è di esplorare i principali fattori abilitanti dell'implementazione di sistemi di distribuzione sostenibili, attraverso l'uso di veicoli elettrici, nel settore della consegna di alimenti. I nostri risultati contribuiscono ad arricchire la letteratura in questo campo di ricerca e in particolare le strategie di gestione adottate dalle aziende di consegna di alimenti al fine di incoraggiare sistemi di consegna più sostenibili. Dal punto di vista gestionale, i risultati consentono informazioni utili per incoraggiare la diffusione di questi veicoli, contribuendo nel contempo a ridurre le emissioni nelle aree urbane.

## **OBJECTIVE**

The aim of this work is to investigate the main enabling factors facilitating the diffusion of the e-mobility in the food delivery sector through the analysis of the Deliveroo case study. Deliveroo s.r.l. has been chosen for two main reasons. First, the growing importance of the company in the food delivery market, with an annual turnover increase of +120 million euros in 2017, becoming one of the major national players for food delivery. Second, the company recently adopted a strategy to support the diffusion of electric mobility for home delivery through the subscription of specific agreements.

## **METHODOLOGY**

In order to explore and describe the main enabling factors facilitating the diffusion of the e-mobility in the food delivery sector, a conceptual framework was developed based on three theoretical lenses as the absorptive capacity model (ACAP) (Newey and Zahra, 2009), the dominant logic theory (Bettis et al., 1978), and the theory of planned behavior (Ajzen, 1985, 1987). A case study approach has been used based on interviews and informal speeches with three business managers of functions, as a primary source, and archival data collection, as secondary information. The various data sources were triangulated.

## **EXPECTED RESULTS**

Today more than in the past, sustainable mobility has become a priority to respond to the environmental pressures of the various economic sectors, among which food delivery is one. The case study analysis aims to explore the strategy adopted by one of the most important food delivery companies on the international scene. Results show that the decision to adopt a more sustainable

distribution model, through the use of electric vehicles, is guided by the environmental pro-active behavior of the heads of the business managers, by the dominant logic of the top management and by the ability to acquire and capitalize market information.

*Keywords: electric mobility, online grocery shopping, sustainable behavior, emissions, food meals, supply chain, urban transport*

## MEASURING THE CONSUMERS' LEVEL OF SATISFACTION FOR ONLINE FOOD DURING THE COVID-19 PANDEMIC

Galati, Antonino<sup>1</sup>; Alaimo, Leonardo Salvatore<sup>2</sup>; Fiore, Mariantonietta<sup>3</sup>

<sup>1</sup>Dept of Agricultural, Food and Forest Sciences, University of Palermo, Palermo, Italy

<sup>2</sup>Istat, National Institute of Statistics, Rome, Italy

<sup>3</sup>Dept. of Economics, University of Foggia, Foggia, Italy

### ABSTRACT

### BACKGROUND

Lately, the spread of COVID-19 pandemic has led to a further increase in the number of customers who buy food products online to comply with the rules aimed at limiting the spread of the virus, and this surge will probably have a positive effect on m-commerce in the long term. Despite the growing diffusion of online food shopping, there are currently few empirical studies aimed at observing and understanding the level of satisfaction of consumers using modern m-commerce technologies. In addition, little research is consecrated to fill the scientific gap related to the analysis of Italian market, which have recorded an increasing share of consumers interested in buying food online above all during this dramatic pandemic period. Extant literature on online shopping of food products have mainly focused on identifying the main drivers affecting the acceptance and intention of online purchase or the continuance intention to buy online (Driediger and Bhatiasevi, 2019), on which characteristics of the product or seller affect this intention (Zheng et al., 2019; Daniel Shehan et al., 2019) and on what product information can determine a higher frequency of online purchases (Benn et al., 2015). Another interesting filed of research examined the behavior of online food buyers, in some cases by comparing online purchases with offline shopping (Van Droogenbroeck and Van Hove, 2020; Rogus et al., 2019) and the factors affecting the transition from offline to online purchase (Singh and Rosenghin, 2020).

### PURPOSE

Given this scientific framework, the aim of this work is to investigate the level of satisfaction of consumer in buying food by means of online grocery shopping channels during this grave COVID-19 pandemic, starting from the description of the main factors that have characterized the online spending behavior. The analysis was carried out by collecting data deriving from an online questionnaire administrated to an Italian 'snowball' sample through social networks and emails, in the March-May 2020 time range. The questionnaire was first tested by experts in online purchasing

channels and by scientific representatives. 249 were the final respondents that completed the survey. About 25% did not conclude the questionnaire because did not meet the criteria of having purchased at least once on line. Finally, the purpose was to elaborate an index by considering the evaluation expressed by the respondents on the main aspects characterizing the online spending behavior.

## METHODOLOGICAL APPROACH

The methodological idea was based on constructing a synthetic measure that, taking into account the respondents' assessments of specific aspects of their shopping experience, is able to express the degree of user satisfaction. From the methodological point of view, the synthesis was obtained using a non-aggregatory approach. The adoption of this methodology allows to obtain a synthesis of basic indicators without any operation on the data (normalization and aggregation) and allowing to respect their ordinal nature. There is a large literature on the treatment and synthesis of multidimensional systems of ordinal data using non-aggregative methods, allowing the construction of synthetic measures without the aggregation of the scores of basic indicators. Within this approach, poset has become a reference over the years, as demonstrated by many works in different fields of research (Carlsen and Bruggemann 2017, Arcagni et al. 2019). However, poset can also be suitable for quantitative data (see: Fattore 2018, Alaimo 2020, Alaimo et al. 2020a, Alaimo et al. 2020b), allowing overcoming of some limitations of the aggregative methods. A poset  $P=(X, \prec)$  is a set  $X$  equipped with a partial order relation  $\prec$ , i.e. a binary relation satisfying three properties (Neggers, 1998):

reflexivity  $x \prec x \quad \forall x \in X$

antisimmetry  $\text{if } x \prec y \text{ and } y \prec x \text{ then } x = y, x, y \in X$

transitivity.  $\text{if } x \prec y \text{ and } y \prec z \text{ then } x \prec z, x, y, z \in X$

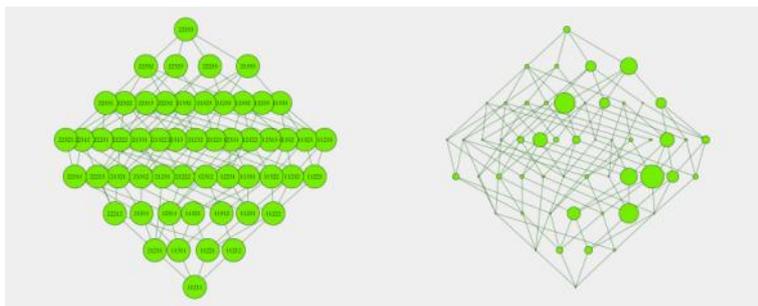

The incidence matrix defines the structure of comparabilities; it is a matrix  $Z_p = (z_{ij}) \in Z^{k \times k}$

where  $|X| = k$  is the cardinality of  $X$  and  $z_{ij}$  is equal to 1 if  $x_i \prec x_j$ , otherwise is 0, with  $x_i, x_j \in X$ . It is necessary to define the cover relation to provide a graphical representation of comparabilities. Given two elements,  $x_i, x_j \in X$ , we can affirm that the element  $x_j$  covers the element  $x_i$  ( $x_i \prec x_j$ ) if  $x_j$  dominates  $x_i$  ( $x_i \prec x_j$ ) and there is no other element  $x_h \in X$  that jointly dominates  $x_i$  and is dominated by  $x_j$  ( $x_i \prec x_h \prec x_j$ ). The Hasse diagram is the graphical representation of the directed acyclic graph representing the cover relation  $\prec$ . In this graph, the orientation from top to bottom substitutes the arrows. By transitivity, two elements are comparable if a path connects them in the Hasse diagram. Posets are used to define the structure of comparabilities underling multi-indicators systems. Once the structure is defined, we can analyze it by using different mathematical tools (Fattore, 2017).

## EXPECTED RESULTS

The index has been constructed considering the evaluation expressed by the respondents on a scale from 1 (low) to 3 (high), on 5 aspects characterizing the online spending behavior: time, cost-effectiveness, product quality, purchase safety and judgement with respect to initial expectations. The first step has been the construction of the Hasse diagram. Figure 1 reports the Hasse diagrams representing the structure of comparabilities and the distribution of the respondents in each profile. The following step is to derive a synthetic measure from the structure of comparabilities. Through a simple procedure (Alaimo, 2020), it is possible to assign to each element of a finite poset a score representing its position in a "low-high" axis. In this way, we obtain the *average height*, i.e. the average position assumed by a profile in each of the considered linear extensions.

**Fig. 1. Satisfaction on online spending behavior - Hasse diagrams: general structure of comparabilities (on the left) and distribution of respondents in each profile (on the right).**

**Source: our elaboration**

We cannot use the average height – representing itself a synthesis – as an expression of the level of satisfaction, as it is a measure of (average) positioning of the profile in the general order. Furthermore, if we apply the quantile criteria to split the profile into groups, we could find in a single group profiles expressing very different levels of satisfaction and profiles of the same level in contiguous groups. In this way, we risk committing errors in attributing a satisfaction level to individual respondents. In addition to the position in the general order, we need to take into account the situation in terms of *satisfaction' deprivation* of each profile, by establishing a criterion to assign the response profiles to the "deprived" or "not-deprived" category. We can do this by defining a *threshold profile*. This choice allows characterizing the distribution according to a conceptual definition of the phenomenon. Starting from the partial order among the profiles, the aim of our analysis is to identify the deprived profiles, with respect to their distance from the threshold profile. By doing this, it will be possible to obtain a measure of the level of satisfaction of individuals that also takes into account the distance from a minimum level of satisfaction (the threshold) below which the respondents will certainly be dissatisfied. At the same time, it will be possible to identify all those profiles that will be dissatisfied

according to a certain level of uncertainty. Investigating the satisfaction of consumers that buy food via online grocery shopping can certainly be crucial for understanding consumer behavior thus giving new insights to retailers and producers as well as scholars and helping and defining valuable tools for improving the m-commerce.

### ABSTRACT

Joint ventures (JV) are the expression of a peculiar component of a company's intellectual capital (IC), i.e. its relational capital that represents the part of knowledge embedded in relationships with external stakeholders (Sharabati et al., 2010; Zambon, 2002). JV's literature addressed several topics such as JV's performance, innovation and internationalization. A stream of this literature has taken into account the effect of the characteristic of a firm's ownership and management on JVs' investment choices mostly focusing on the point of view of internationalization and entry mode choices (Sestu and Majocchi, 2020; Debellis et al., 2020; Scholes et al., 2016; Kuo et al., 2012; Claver et al., 2007) and innovation (Feranita et al., 2017). Literature has pointed out the influence of the unique bundle of resources generated by the interaction of family and business (Habbershon and Williams, 1999), on a firm's intellectual capital (Cabrera-Suárez et al., 2001). As a matter of fact, family firms rely on specific human capital intangibles provided by the family involvement in the firm and related to the founder's personality, the values shared by family members or the knowledge acquired from previous generations (Claver-Cortés et al., 2015). Family influence moderating role on the relation between IC and innovation (Diéguez-Soto et al., 2016), its effect on the relational capability development (McGrath & O'Toole, 2018) as well as family firms' unique characteristics in creating and governing Joint Ventures (Debellis et al., 2020) have been highlighted by literature.

Existent literature has highlighted the importance of verifying the interplay between components of IC, because they influence each other and certain components of IC can benefit from the improvement of other components (Johnson, 1999; Reed, 2006). As a matter of fact, research investigating the effect of IC on firms' financial performance and/or firms' market value has provided evidence that some categories of IC affect firms' performance or firms' market value indirectly, through their positive influence on other intellectual assets.

To the best of our knowledge literature has not yet investigated how the different components of IC are related to the investment in JVs. Therefore, it is of interest to analyze how a firm's ownership and management nature (family or non-family) affects the investment in joint ventures controlling for the effect of other IC components.

This paper addresses the following research question: Do family ownership and board characteristics affect investment size in JVs?

We address this R.Q. taking into account the effect of the other components of intellectual capital and of JV type (scale or link JVs). We base on the socioemotional wealth (SEW) concept that refers to the stock of affect-related value that a family derives from its controlling position in a firm (Gomez-Mejia et al., 2007; Gomez-Mejia et al., 2011; Berrone et al., 2012). It shapes firms' decisions and may affect the investment in JVs in different ways.

In so doing we analyze a sample of Italian, Spanish, German and French non-financial listed firms over the period 2010-2018. The sample is of particular interest as these economies are widely characterized by the presence of family businesses that have long-lasting family control (Franks et al., 2012).

The results indicate that JVs investment size is lower for family owned businesses than for non-family firms. A strong direct influence of the family on the board by the means of CEO duality as well as the link type of joined control reduce the investment size in JVs although family firms are more prone to engaging in link ventures than non-family businesses. Other intellectual capital components do not differently affect family and non-family firms' JVs investment size.

This study contributes to the stream of research on the determinants of family firm's investments. It also adds to the intellectual capital literature as well as to the existing research on joint ventures, by investigating the efficiency of which components of intellectual capital affects the size of investments in joint ventures.

## DOES INTELLECTUAL CAPITAL COMPONENTS AFFECT INVESTMENT SIZE IN JOINT VENTURES? FAMILY VS NON-FAMILY FIRMS

Gavana, Giovanna<sup>1</sup>; Gottardo, Pietro<sup>2</sup>; Moisello, Anna Maria<sup>2</sup>

### ABSTRACT

Joint ventures (JVs) are the expression of an important component of a company's intellectual capital (IC), i.e. its relational capital. Literature has pointed out how the latter influences the development and performance of a firm's JVs (Aggarwal, 2019; Thuy & Quang, 2005; Liu et al., 2010) but the influence of the other components of the IC on JVs needs to be deepened.

Existent literature has highlighted the importance of verifying the interplay between components of IC, because they influence each other and certain components of IC can benefit from the improvement of other components (Johnson, 1999). Several studies have investigated the effect of IC on firms' performance and/or firms' market value, providing evidence that some categories of IC affect firms' performance or firms' market value indirectly, through their positive influence on other intellectual assets. The study by Bontis et al. (2000) reveals a direct and positive link between structural capital and a firm's performance, but also shows that human capital has a positive impact on both customer capital and structural capital. Wang and Chang (2006) detect a cause-effect relationship among four elements of IC and find that human capital helps improving IC elements that have a direct and positive impact on a firm's performance, namely innovation and process capital. Conversely, Cheng and Hsiao (2010) show that human value added is the IC component that most impacts a firm's performance, a maintainable customer relationships, whilst innovation and process capital positively influence the former IC components. Furthermore, firm value would be enhanced by innovation capital and relationship capital, that, in turn, would be positively affected by human capital and organizational capital (Tseng & Goo, 2005). Literature has also analyzed the interaction between IC efficiency and physical and financial capital employed efficiency, showing that the former amplifies the positive effect of the latter on a firm's performance (Seng et al., 2011).

To the best of our knowledge literature has not yet investigated how the different components of IC are related to the investment in JVs. Moreover, literature has pointed out the influence of familiness, the unique bundle of resources generated by the interaction of family and business (Habbershon and Williams (1999), on a firm's IC (Cabrera-Suárez et al. 2001). Family influence moderating role on the relation between IC and innovation (Diéguez-Soto et al., 2016), its effect on the relational capability development (McGrath & O'Toole, 2018) as well as family firms' unique characteristics in creating and

governing JVs (Debellis et al., 2020) have been highlighted by literature. So, it is of interest to analyze the effect of IC components on JVs taking into account the family nature of a firm's controlling owner and management.

This paper addresses the following research question: Does intellectual capital components affects investments size in JVs? In so doing, it analyzes a sample of Italian, Spanish, German and French non-financial listed firms over the period 2010-2018. The sample is of particular interest as these economies are widely characterized by the presence of family businesses that have long-lasting family control (Franks et al., 2012).

We investigate the effect of human and structural capital efficiency (Pulic, 2004) on the size of the investment in joint ventures in family and non-family firms in order to take into account the effect of the controlling owner and management nature. In so doing we control for the effect of: JV type - link vs scale (Hennart, 1988; Lourenço and Curto, 2010) – a number of board attributes, a firm size, capital employed efficiency, profitability and extra European Union operativity. We also control for firm, country, industry and year fixed effects. The results indicate that human capital efficiency has a significant effect on the size of the investment in JVs in general, but does not show differences between the family and non-family counterparts. The nature of ownership, per se, does not influence the size of the investment: what matters are the characteristics of the board in relation to the nature of ownership. The presence of CEO duality has an opposite effect on the size of the investment in joint ventures, as it has a lowering effect in family businesses whilst it exerts an amplifier influence in non-family firms. The type of joint venture, link vs scale, has a significant effect in presence of a family CEO and the choice of a link joint venture increases the size of the investment.

This study can contribute to both the literature on intellectual capital and to family business research.

## ANNUAL REPORTS AND CORPORATE CULTURE COMMUNICATION

Gomes, Patrícia; Oliveira, Lídia; Caria, Ana

School of Economics and Management, University of Minho, Braga, Portugal

### ABSTRACT

Annual reports are a strong organizational communication tool. Since the 1960s, its scope, content, structure and format has radically changed (Beattie *et al.*, 2008; Lee, 1994; Stanton and Stanton, 2002). In addition to financial information, non-financial information is now reported as a stylistic means to represent the corporate identity of the organization and to influence external stakeholders (Hopwood, 1996; Lee, 1994).

Accounting has always incorporated words and numbers, but the role of narratives has increased substantially, including new disclosure categories (Davison, 2011a). This evolution is remarkable both in narrative and in design terms as annual reports are now characterized as sophisticated documents, with narrative and visual voluntary reporting sections (Beattie *et al.*, 2008; Davison and Skerratt, 2007; Hopwood, 1996). The increasing investment in visual appearance and in writing mode is underpinned by the organization's image management, the search for legitimacy in conveying of corporate social responsibility, also being seen as a mean of impression management (Davison, 2015), with connotative and denotative character intrinsically associated (Barthes, 1977; Davison, 2011a).

Annual reports are a powerful tool in communicating a holistic story of the organization to a wide range of audiences. Within annual reports, both numbers, words and visual presentation are used symbiotically to create the story. Therefore, organizations in communicating reality construct reality (Hines, 1988).

Considering accounting communication as a dynamic and interactive process between a sender (organization) and receiver (stakeholders), in a specific context, that intends to create, sustain and manage meanings (Merkl-Davies and Brennan, 2017), the annual report is a communication exercise, a "space of multitudinous signs" (Davison, 2008: 819). The selection and integration of narratives, language, visual images and other symbols in annual reports engage the reader as a co-maker of the story (Stanton and Stanton, 2002). These arguments support the study of the annual report's paratext, as defined by Genette (1987), and consequently the use of Barthes' (1977) model of denotation and connotation intermingled in the visual images, explored in accounting literature by Davison (2011a; 2011b).

This paper adds to the empirical work on the rhetoric of narratives and visual images in annual reporting by using the lenses of Genette's paratext and Barthes' rhetoric of the image (Barthes, 1977;

Genette, 1987). Therefore, this study analyses the use and motivations to include paratextual elements, particularly visual images, in annual reports.

This analysis is developed through an interpretive case study of a Portuguese company, the dst group - *Domingos da Silva Teixeira* (dst group- sgps, s.a.), during the period of 2008-2013. Data was gathered through the qualitative content analysis of dst group annual reports and through semi-structured interviews conducted with those involved in the conceptualization and preparation of the annual reports (the manager of Institutional Relations, Communications and Events; the designer; the responsible for External Communication and; the Chief Financial Officer).

All dst group annual reports include the paratextual elements, as identified by Genette (1987). The annual reports are different, both in graphic and visual terms, following a theme or concept. The physical format, the textual and visual epigraphs, and the Chairman's Letter are the distinguishing elements of the annual reports.

According to the interviewees, the motivations underlying the incorporation of paratextual elements in the annual reports stem from the intention to transmit: the company's identity and organizational culture; the credibility of the accounts; the organizational values; the company's social responsibility and the company's support to culture. The respondents recognize the importance of paratextual elements and its connotative and denotative meanings that, although intentional and part of a message to be transmitted, can be interpreted in different ways by different stakeholders, as suggested by Barthes (1977).

This study demonstrates the potential of the annual report as an instrument of communication between an organization and its stakeholders and illuminates the way in which discretionary narratives and visual images highlight and supplement accounting information. The results evidence that the dst group recognizes and explores the potential and value that their annual reports pose to communication of its identity and organizational image to its stakeholders.

## CONSUMER CULTURE THEORY AND CONSUMPTION COMMUNITIES: A FIRST APPROACH TO VEGAN COMMUNITIES

Hungara, Ana Paula; Nobre, Helena

Research Unit on Governance, Competitiveness and Public Policy (GOVCOPP) and Department of Economics, Management, Industrial Engineering and Tourism (DEGEIT), University of Aveiro, Aveiro, Portugal

### ABSTRACT

In 2005, Arnould and Thompson presented a branding for consumer culture theory (hereby named CCT), a new research tradition in consumer behaviour, with contributions from other social sciences (Bode and Østergaard, 2013; Casotti and Suarez, 2016). CCT's field contributions are grouped into four theoretical frameworks, one of which is marketplace cultures (Arnould and Thompson, 2005). Marketplace cultures refers to the relationship of the consumer with the marketplace, defined in terms of consumption communities (Schau, Muñiz and Arnould, 2009). There are three types of consumption communities: subcultures of consumption, consumer tribes and brand communities (Canniford, 2011). However, they can change their network configurations over time (Canniford, 2011; Hook, Baxter and Kulczynski, 2018). Simultaneously, social media changed consumption communities' characteristics (Arvidsson and Caliandro, 2016); and consumer's interactions (Lima, Irigaray and Lourenco, 2019). Ethical and political concerns are modifying buying behaviours (Cherry, 2015) as exemplified by vegan communities. Nevertheless, the changes in consumption communities and consumer behaviour enhanced by social media and ethical and political concerns are still understudied.

The main purpose of this research is to identify the main contributors to the CCT, consumption communities and vegan communities' literature since 2005 until nowadays. Departing from a bibliometric analysis using the Software Vosviewer, a systematic literature review is currently ongoing. Following the method from Sarmiento and Simões (2018), a plan was defined for the identification of relevant studies in the Scopus and Web of Science databases. The selected research is based on the following criteria: 1) only journal articles in English language are selected; 2) the articles selected are peer-reviewed; 3) the journal articles are published in Q1 or Q2 journals; 4) the timeframe for reference is 2005-2020; 5) at least one of the following needs to be included in the article's keywords: Consumer Culture Theory; Consumption Communities; Vegan Communities.

So far, research in Scopus and Web of Science for Consumer Culture Theory led to 58 articles published in Q1 journals and 17 in Q2 journals. For the connection between Consumer Culture Theory and Consumption Communities, the databases selected returned 19 articles, out of which 14 were published in Q1 journals and 5 in Q2 journals. No results could be found when combining Consumer

Culture Theory and Vegan Communities. These results show the popularity of CCT in well-renowned journals, as demonstrated by Bode and Østergaard (2013). The findings also support initial assumptions that the connections between CCT and consumption communities have been understudied.

This work attempts to shed light on the avenues for further research on the topic. Hence, it will hopefully contribute to the literature in CCT and consumption communities.

## TECHNOLOGICAL INNOVATIONS AND ARTIFICIAL INTELLIGENCE IN INTERNATIONAL MARKETING RESEARCH: A SYSTEMATIC REVIEW

Iaia, L.<sup>1</sup>; Christofi, M.<sup>2</sup>; Vrontis, D.<sup>2</sup>

<sup>1</sup>Department of Business Administration, University "Gabriele d'Annunzio" of Chieti-Pescara, Italy

<sup>2</sup>School of Business, University of Nicosia, Cyprus

### ABSTRACT

In today's era, novel technological innovations are introduced every year and change the dynamics of the global competitive arena, economies and markets, as well as the society itself in formidable ways. Such technological innovations include, artificial intelligence (AI), human-like products, big data, cloud computing, Augmented and Virtual Reality, machine learning, cryptocurrencies and blockchain applications, Internet-of-Things (IoT), and Cognitive Systems, among others (e.g., Kumar et al. 2016; Longoni et al. 2019; Ng and Wakenshaw 2017; Belk 2013). New technological innovations have enabled a radical shift towards the creation of innovative products, such as electrical vehicles and new innovate processes, such as the use of 3D modelling in product development (Evers, Cunningham, & Hoholm, 2014). In the international perspective, several researches studied the role of internet to improve international activities (Aspelund, Koed Madsen and Moen, 2007; Øystein, Tage and Arild, 2008) for exporters (Gabrielsson and Kirpalani, 2004; Morgan-Thomas and Bridgewater, 2004; Mathews and Healy, 2008), and companies (Lu and Julian, 2008) of different sizes (Arnott and Bridgewater, 2002). The investigated aspects regard the communication activated through the usage of internet (Prasad, Ramamurthy and Naidu, 2001).

However, for the international business the international marketing is still considered an under-investigated theme (Gaur and Kumar, 2018) as well as the impact of technological innovations on communication (Leonardi & Vaast, 2017; Sarala, Vaara, & Junni, 2019), and on the internationalization process (Knight and Liesch, 2016) which highlight the multidisciplinary of such topics. Also, work that provides a holistic understanding of the role of such technologies in marketing within the global arena is absent. Based on this, in our knowledge this would be the first work investigating the role, influence and use of artificially intelligent technological innovations in the context of international marketing research. The purpose of the article is to provide a holistic understanding of the relationship between artificially intelligent technological innovations and their role, use and influence on the marketing practices of international businesses. Our research question is "how are the various artificially intelligent technological innovations used in the marketing practices of international organizations?". Using the "Antecedents-Phenomenon-Consequences" logic (Narayanan, Zane and Kemmerer, 2011; Pisani and Ricart, 2016), the objective of this study is to develop a systematic review on the theme,

contributing to: (i) review the extant research, (ii) generate a multi-dimensional framework based on technological innovations and international marketing for academics and practitioners; (iii) find the relevant theoretical insights and knowledge gaps, which could draw the path for future research carried out by scholars, (v) as well as to find guidelines, that represent the empirical implications useful for practitioners.

As regards to the scope of our review, we focused on articles that are published on the leading marketing journals, because such journals substantially contribute to academic development in the field (Christofi et al., 2019). Hence, we followed examples of existing state-of-the-art systematic reviews (e.g., Vrontis & Christofi, 2019), and focused on studies in peer-reviewed journals ranked 3, 4 or 4\* in the ABS 2018 ranking list. To identify such studies we will use EBSCO Host Business Source Premier database as it provides the biggest coverage of business journals (Kranzbühler et al. 2018). Next, based on standard practice from state-of-the-art reviews in leading journals (e.g., Gaur & Kumar, 2018), we will focus on full-length, peer-reviewed articles and exclude book reviews, commentaries, editorials, conference proceedings and replies. Following a combination of the search terms included in existing reviews on technological innovations (Glikson & Woolley, 2020) and international marketing (Seggie, 2012), the keyword search formula to be employed in the current study is the following: (*"artificial intelligence" OR "machine learning" OR "computational intelligence" OR "soft computing" OR "data mining" OR "evolutionary computation" OR "evolutionary programming" OR "genetic algorithm" OR "genetic programming" OR "fuzzy systems" OR "deep learning"*) AND *"international marketing"*. The keyword formula will be used in order to search the titles, abstracts, and keywords of studies, in line with previous practice (Christofi et al., 2019).

*Keywords: Technological innovations; artificial intelligence; international marketing; systematic review.*

## EXAMINING THE ROLE OF ORGANIZATIONAL CULTURE IN CORPORATE SUSTAINABLE DEVELOPMENT

Jimenez-Castilla, Tania; Bolivar, Luis Miguel; Segrera-Castilla, Michael

Business School Universidad Tecnológica de Bolívar

### ABSTRACT

In the current competitive environment, sustainability indicators have risen as new competition arenas among companies along with traditional financial indicators such as liquidity, revenue stream and profitability. This has led to the ubiquitous implementation of social responsibility programs and environmental management systems by firms. However, it has been asserted that companies must not only apply such managerial measures for the sake of fulfilling a sort of mandate, but that, in addition, an organizational sustainability culture is needed to guarantee the long terms performance and survival of companies. The question that remains is how such organizational sustainability culture should be understood and brought to the managerial practice; moreover, there needs to be clarity on how to nurture a corporate sustainability culture within the firm. For this reason, this article aims to revise the scope of the mainstream theoretical contributions that have allowed corporate sustainability culture to become a rising tendency in the business administration discipline. For this purpose, we revise the conceptualization of the three elements of this construct: namely, corporate culture, sustainable development, and corporate sustainability. In this sense, we first revise how the corporate culture has been understood and decodified as a source of strategy; this sets the basis for aligning the array of beliefs, costumes, and values of the intra-organizational environment with the sustainability principles and ethos. Second, we explore how sustainable development has been conceptualized as a business objective that has become a key variable in determining a firm's competitive strength; thus permitting the consolidation of the sustainable corporation construct in alignment with the Sustainable Development Goals (SDGs). And finally, we introduce a conceptual framework for corporate sustainable development that integrates sustainability principles and its praxis with the necessary elements for nurturing a corporate culture that is able to embrace organizational sustainable behavior. Hence, we contribute to the current literature by integrating into a framework the key elements for the construction of a responsible company that carries sustainability in its corporate culture and identity.

## ABSTRACT

## INTRODUCTION

Emotions and rationality have been juxtaposed as opposite ends (Solomon and Stone, 2002). Yet “*the only way to make rational decisions is to tag cognitions denoting options with emotions that give a person a sense of utility*” (Turner, 2009, p. 343). In the recognition of this, researchers within the International Marketing (IM) and International Business (IB) field have highlighted that positive and negative emotions shape actors’ international behaviour (Leonidou *et al.*, 2019). This is not surprising given that decisions that are taken in an international context are complex and they are characterized by high uncertainty and risk (Eduardsen and Marinova, 2020), hence giving room for a lot of emotions in businesses international decision-making processes (Langley *et al.*, 1995).

Although emotion research has started to expand within the fields of IM and IB the last two decades (Leonidou *et al.*, 2019), up to the authors’ knowledge, there is no systematic literature review on emotions in international decisions (IDs). In addition to this, emotion research in the fields of IM and IB remains interdisciplinary since researchers borrow theories from other research fields such as the appraisal theory from psychology (e.g. Andersen and Kumar, 2006). These aspects highlight the need for a systematic literature review in order to keep up with state-of-the-art research and to be at the forefront, as well as to assess the collective evidence in the particular research area of emotions in IDs.

Bearing these aspects in mind, the aim of the present study is to provide a *qualitative systematic review of the literature* on emotions in IDs. In doing so, we address the following research questions: (1) *what are the key themes in the literature on emotions in IDs?* (2) *what are the overall findings within each theme?* (3) *what are the main gaps in the literature?* and (4) *where should primary research effort be directed?* A qualitative systematic literature review is especially important when one is seeking to map an emerging field conceptually, to identify knowledge gaps and to assess the state of the art (Snyder, 2019).

## METHODOLOGY

There are different types of literature reviews, yet, it is the research question of the review which determines the appropriate type to use (Christofi *et al.*, 2017; Snyder, 2019). Our research questions highlight the need for a *qualitative systematic literature review*. A qualitative systematic literature review follows a systematic review process to collect articles, and then a qualitative approach is used to assess them (Snyder, 2019). Taking this into account, the process of conducting our literature review is inspired by literature review scholars such as Christofi *et al.* (2017) and Gaur and Kumar (2018). In particular our literature review follows three steps, namely: (i) locating the relevant research, (ii) conducting content analysis through the use of a conduct computer-aided text analysis (Atlas.ti), and (iii) writing up the review by reporting the results by aggregating under thematic headings and highlighting promising research themes.

To locate our data pool of articles we used inclusion and exclusion criteria. We also used specific keyword terms. To locate the keyword terms for our review and given that a single agreed definition on the term “emotion” remains elusive (Kellermans *et al.*, 2014), we started the review process by initially reading a highly cited paper in the emotion literature (Ashkanasy *et al.*, 2002). Next, we conducted an initial search in the Web of Science and Business Source Complete databases. We searched keyword terms (*emotion* or *feel\** or *affect\**) in the title, abstract and/ or keywords by focusing our search in the most influential journals publishing IM and IB research (e.g. *Journal of International Business Studies*, *Journal of International Marketing*, and *International Marketing Review*). In line with the suggestions of Morgan *et al.* (2018) the criteria for journal selection were based on previous ratings of journals in IM and IB disciplines. Although the exclusion of articles published in conference proceedings or book chapters or unpublished research studies, may bring with it a risk of publication bias (Kepes *et al.*, 2012), we took the view that increased scientific rigour would be achieved by basing our results on peer-reviewed academic publications. Finally, since we wanted to focus our review on emotions on IDs, we search for the term international within the content of the articles. This process rendered a sample of 212 articles. To analyse the identified articles we used a computer-aided text analysis namely, Atlas.ti which allowed us to track coded text and extract it, along with corresponding coding categories, for reporting. It also provided functionalities for data interpretation and summarization (cf. Gaur and Kumar, 2018).

## FINDINGS

Preliminary findings show that most emotion research appears in the *Journal of International Business Studies* and in *International Marketing Review*. Authors use different definitions depending on the

aspects of emotions that are relevant for their study, but the most used definition is the one given by Lazarus (1991).

IM and IB research on emotions can be separated in two research streams with regard to the different types of businesses, namely emotions in family firms and emotions in other types of businesses. Emotions seem to affect more family members than non-family members (e.g. external managers) (Kellermanns *et al.*, 2014). Regardless of the business type, emotions have been studied within IB relationships (e.g. Andersen and Kumar, 2006; Leonidou *et al.*, 2019) which seems to be a promising future research area.

Our literature review is currently under the analysis of the identified articles and is expected to bring into light other important key themes on emotions in IDs. Moreover, this literature review will bring to the fore the research gaps and will highlight where the primary research effort should be directed.

## CONCLUSIONS AND CONTRIBUTION

Up to the authors' knowledge this literature review comprises an initial attempt to encompass the interface of emotions and IDs. Although previous research in emotions has provided useful insights into specific aspects of emotions, they have given only a limited understanding of the key themes driving emotion research in IDs. Nevertheless such an understanding is important in order to advance the IM and the IB field.

The principal contribution of our study is to synthesize and organize the state of knowledge with regard to emotions in IDs and to create an agenda for further research. By doing this, we can help to consolidate previous emotion research and reach conclusions to advance the academic discussion and facilitate further theory development on emotions within the IM and IB field (cf. Eduardsen and Marinova, 2020). Finally it should be noted that this literature review should be of interest to readers not only in the areas of IM and IB, but also in the areas of Family Business and Business-to-Business.

## EX-ANTE AND EX-POST DIFFERENCES IN FIRM-LEVEL CHARACTERISTICS OF U.K. MERGERS AND ACQUISITIONS

### ABSTRACT

Under market condition, mergers and acquisitions (M&As) often endow prospective wealth, and are executed to achieve financial synergy and strategic growth (Leland, 2007). Pre- and post- financial firm related characteristics are highly significant to understand M&A phenomenon. Studies surrounding M&As either examine announcement price-reaction employing variants of pricing models (Fuller et al, 2002); or pursue an accounting approach based on firm level indices (Hassel et al. 2003). The announcement price-reaction studies evaluate the changes in financial performance of merged firms assuming such changes maximize shareholders' wealth. The accounting approach examines firm-specific characteristics of merged firms and a combination of the financial performance of acquirers and targets prior to the mergers (Healey et al., 1992; Powell and Starks, 2006). Such studies, however, mostly focus on ex-post performance of mergers and disregard ex-ante financial characteristics that differentiate acquirers from the targets. Firm-specific characteristics that may influence the decision of undertaking merger are relative less studied (Schiffbauer et al., 2017; Mulherin et al., 2017; Boateng et al., 2019). This is despite the fact that equally important is the financial performance of the firms before mergers, which demonstrates whether as separate groups, acquirers and targets have financial characteristics that are worth exploiting (Elstak et al., 2015). We analyze these characteristics before and after mergers and the strategic impact they may bear on the performance of firms, contributing to an understanding of the reported under-performance of firms after mergers (Dickerson et al., 1997). In particular, to explore the underlying rationales of M&A success, we have undertaken accounting approach contrary to an event study approach. The firm-level accounting indices cover long-term time-horizon for assessing the financial characteristics of the firms, compared to announcement effect studies, which are confined to event-window. Importantly, although firms can window-dress their financial reports and/or manipulate earnings upwards around merger periods, accounting measures are less affected by temporary changes in market conditions (Erickson and Wang, 1999). While separate the pre- and post- financial measures so that their characteristics can be captured more directly across both the periods, we use a representative control sample of firms against which we match the accounting indices for both acquirers and targets.

Against this background, we draw on signalling and monitoring theories to examine how ownership concentration characteristic of pre- and post- M&A firms in the UK presents a possible avenue for examining the managerial choice. We also aim to understand to what extent firm related characteristics including risk and liquidity constraints could further expand on the managerial discretion argument through direct effect or interactive effects. Furthermore, we investigate how the potential growth opportunities for M&A firms can be explained through firm-level internal input and other externalities.

Our study addresses several significant aspects of merger and substantively differs from prior studies, attending to ownership concentration, risk and liquidity constraints of firms engaged in M&As. Unlike conventional merger studies (Bradley and Sundaram, 2006), our dataset is rather comprehensive; thus, captures wider event-induced effects of M&As.

Our study finds that pre-event systematic risk and ownership concentration of acquirers are lower compared to both their control sample and target firms. The lower ownership concentration suggests that acquirers are less restricted when undertaking M&As or pursuing managerial self-interests contrary to their control sample or targets. Post- event systematic risk is reduced relative to the control sample while ownership concentration has increased. The lower systematic risk originates from the post-event positive cash receivable, thereby limiting liquidity constraints, while the lower ownership concentration results from the issuance of shares to fund cash deals. This means, in turn, the executives of merged U.K firms are constrained to undertake post-event sub-optimal decisions.

## GREEK CONSUMER PREFERENCES OF WINE: AN APPLICATION OF THE BEST-WORST SCALING METHOD

Karipidis, Philippos<sup>1</sup>; Chrysochou, Polymeros<sup>2</sup>; Mitrakas, Christos<sup>1</sup>

<sup>1</sup>Dept. of Agriculture - Agricultural Economics & Entrepreneurship, International Hellenic University, Greece

<sup>2</sup>Dept. of Management, Aarhus University, Denmark

### ABSTRACT

Taking into consideration the on-going developments and growing competition in the wine industry, understanding consumer preferences of wine is essential. Many studies analyse consumer behaviour with respect to wine following either quantitative and qualitative methods (Charters and Pettigrew, 2007, Corduas et al. 2013, Mehta and Bhanja, 2018). While these studies offer insight on consumer preferences and behaviours, the methods used do not allow for their results to be safely compared across contexts. A method that has been proposed to overcome this issue and has been used in the wine marketing literature is the best-worst scaling (Marley and Louviere, 2005). A number of studies have measured and compared consumer preference across a wide number of countries using the best-worst scaling method (e.g. Goodman et al., 2008; Goodman, 2009). These studies are based on evaluating consumer preferences on extrinsic cues (e.g. origin, price, brand), which are those that enable wine producers and sellers to create marketing innovations.

Despite the high number of countries that have used the method to assess consumer preferences for wine (Chrysochou et al., 2012; Cohen et al, 2009; Goodman et al, 2008; de Magistris and Royo, 2014), no study has used the method to assess consumer preferences of wine in Greece. In this study, we thus aim to explore consumer preference of wine following the best-worst scaling method (Marley and Louviere, 2005), with the aim to compare Greek consumer preferences for wine to other contexts where the same method has been used.

The data were collected using questionnaires from 220 consumers in Greece. The questionnaire consisted of 13 attributes (see Figure 1) that are identified on earlier studies following a similar approach in measuring wine consumer preferences in other countries (Goodman, 2009; Casini et al., 2009; Chrysochou et al., 2012, Corsi et al., 2020). Following a similar procedure, the attributes were combined in a systematic way following a Balanced Incomplete Block Design in choice sets of 4 attributes. For each set, participants were asked to choose the most and the least important attribute that influenced their choice when buying wine from a retail store.

The attributes are presented in Figure 1 according to their importance in a descending order. The most important attributes are whether the consumers have tried the wine in the past (1.90). The next two most important attributes are the price of the wine (1.08) and whether the wine has been

recommended by a friend or relative (0.96). On the other hand, the least important attributes are the alcohol content (-2.14), followed by the typical advertisement inside the store (-1.74) and the attractive label (-1.31).

We further grouped consumers (see Figure 2) according to their usual store of purchasing wine (supermarket, local store, liquor store) and compared their preferences when buying in wine. Consumers who buy wine from a supermarket or a local store emphasize more price and the fact that they have tried the wine in the past. On the opposite consumers buying from a liquor store give more importance to wine credence characteristics such as brand, origin, medals. Consumers who buy wine from a local store consider as more important that the wine matches with their food. The attractive label is rated as more important by consumers who buy wine from a liquor store, as opposed to those who buy from a supermarket, while the alcohol content is considered as more important by those who buy wine from a local store, as opposed to two other categories.

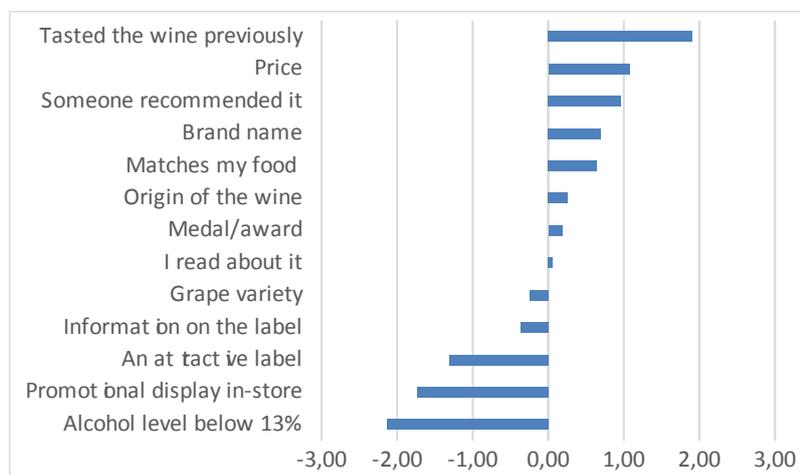

Figure 1. Choice influencers of Greek consumers

Because the present study focuses on the consumers' preferences in regards the extrinsic wine cues, the findings extend those of the previous studies analysing consumer preferences of wine using the best worst scaling method. The most important cues identified to impact the buying preferences in Greece are in accordance with those identified in most markets. More specifically, previous experience and familiarity with the wine, and word of mouth are important drivers of choice. Similarly, alcohol content, as well as labels, attractive packaging and in-store communications do not drive choice. This latter finding provides support to earlier arguments that consumers don't believe they are influenced from marketing stimuli that act in an implicit manner. The price is also a characteristic that Greek consumers consider to be between the three most important, which is not the case in previous studies. It can be attributed to the impact of the economic recession in Greece. The results further confirm the ability of the method to identify the extrinsic cues that influence consumers choices for wine. In an effort to segment the market, we find that preferences vary depending on the store from which

consumers buy their wine. Thus, we conclude that there are important characteristics beyond those of the product, in which producers and sellers contribute, and it should be taken into account in the wine marketing management. More specifically, producers and sellers should focus on the 'previous experience and familiarity with the wine', 'word of mouth' as well as 'price' to create marketing innovations, while the mini markets and liquor stores should give more emphasis on the characteristic 'wine matches my food'. In addition to that, the sellers could be able to improve store quality and economic efficiency if they take into consideration the consumers' buying preferences to properly schedule product variety and inventory levels.

## TAKING A DIFFERENTIATED PERSPECTIVE OF AGE IN THE WORKPLACE - AN EMPIRICAL TEST OF THE GATE-FRAMEWORK IN THE ICT-INDUSTRY

Katzdobler, Sabine; Sackmann, Sonja

Institute for Developing Viable Organizations, Bundeswehr University Munich, Munich, Germany

### ABSTRACT

Negative prejudices against older employees are prevalent in the ICT-industry. Particularly, age-related restrictions regarding training may increase older workers' turnover intention (Bentley et al., 2019), since ICT-professionals want organizational support (Taneva et al., 2016). However, studies about employees' age diversity and specifically older employees' ITQ are relatively scarce (Taneva et al., 2016).

To avoid employee shortages in the ICT-industry due to ageism, rethinking the concept of chronological age is essential. Scholars have called for a more differentiated perspective of age as a construct (e.g. Hernaus et al., 2019). In North's recently developed framework, he posits disentangling age-based components involving *Generation, Age, Tenure* and *Experience* or „GATE“ (North and Shakeri, 2019). Every single GATE-element is associated with a separate body of literature revealing inconclusive predictions for older workers' job outcomes (North, 2019). Nevertheless, these bodies of literature provide the potential for developing a more differentiated conception of older workers.

Since GATE has not yet been empirically tested, it is unclear if GATE's four components add value to a differentiated perspective of age. In addition, North's discussion of the relationship between GATE-elements and performance refers predominantly to cross-sectional studies, neglecting potential longitudinal effects. In North's original publication, he related the GATE components to job performance. Due to data limitations, we take an employee's voluntary intention to quit (ITQ) as a reverse proxy for job performance since a recent meta-analysis found a significantly negative relation between ITQ and performance (Zimmerman and Darnold, 2009).

The purpose of our study involves an empirical test of North's GATE-framework in the ICT-industry, thus contributing to a more differentiated conceptualization of age. Since the general turnover trend of ICT-workers remains high (Lo, 2015), an ITQ-related approach is adopted. We combine age-related constructs with changes in ITQ of ICT-professions using the database of the Socio-Economic Panel (SOEP) and structural equation modeling (SEM) for the group of ICT-workers. These constructs, which have often been regarded as linked, are checked individually over time for their influence on ITQ.

In terms of methods, a longitudinal ordinal logistic regression is appropriate to calculate correlations between the exogenous GATE-constructs and ITQ, because the endogenous variable is categorical and

ordinal. The logistic regression analysis is combined with SEM to better detect the changes of effects over time. We focus on three data points spread over a period of 10 years (2009; 2013; 2018) involving a sample size of 238 ICT-employees and cover the age range between 18 and 68 years. This approach allows uncovering age-related patterns in the change of ITQ (e.g. extent of stability) in ICT-occupations over time identifying longitudinal effects of GATE-elements on ITQ.

We discuss implications for future research and for practice with a focus on the most predictive age-based constructs for ITQ regarding age-sensitive training that consider different forms of motivations of older and younger ICT-workers for example. Hence, our study contributes to counteracting the overemphasis of chronological age in common stereotypes.

<sup>5</sup>Pankhurst Trust Ltd

### ABSTRACT

In addition to the celebrations of the Pankhurst Trust 2018 Centenary Events when Some Women achieved the vote – and, a year that drew attention to the need to continue to ensure women are equally represented in positions of power in the workplace as demonstrated by the *#me too* social movement and a year when the Social Mobility Commission demonstrated the slowing down of social mobility. By March 2018 the publication of the Gender Pay Gap certainly confirmed the need for more action to be taken. The coaching project was an initiative launched by a group of women under the auspices of the Pankhurst Trust who particularly recognised the undervalued skills of women in civic society and also jobs in the hospitality and retail sector. We were keen to offer an alternative to the corporate websites with coaching courses that might not been seen as relevant to the target group. Talking with a variety of senior women in both the private but mainly public sector we found a great deal of support for the idea of a different sort of coaching service and target group and offers to volunteer for any such initiative.

Much has been written about the need for diversity, equity and inclusion in the workplace (Bond and Pyle, 1998; Kelly and Dobbin, 1998; Liff and Wajcman, 1996). A recent survey by Price Waterhouse Coopers highlighted that over 80 percent of CEOs are focussed on promoting diversity and inclusion in their organizations. Coaching initiatives are a vital component for establishing a successful workplace diversity and inclusion programs. Moreover, companies with greater gender and cultural diversity have shown an overall increase in their revenues (Hunt et al, 2018). Still, we find that that the majority of organizations who provide coaching have only paid lip-service to the needs of their employees in terms of their personal and career development (Feldman and Lankau, 2005; Kampa-Kokesch and Anderson, 2001; Mackie, 2007). The majority of women including minorities remain under-represented in many occupations, most notably in high level positions (Hunt et al, 2018). Research has shown that coaching is a vital not only for professional development but to also improve self-confidence, build networks and provide a balance between work and home life (Coffey et al, 1999; Ruderman and Ohlott, 2002) (Birkeland et al, 1997; Peterson, 1993). However, there is little

research that examines how and why coaching works (Ely et al. 2010; Feldman and Lankau, 2005; De Meuse et al, 2009), especially for women who lack access to these resources. Moreover, the coaching literature is insufficient on diversity in terms of research. This may be related to the fact that the coaching literature itself is relatively sparse with adhoc studies (Spence and Oades 2011).

To respond to the lack of research in evaluation of coaching programs for leadership development for women (Kauffman and Coutu 2009, Grant and Cavanagh 2007), this paper presents a coaching evaluation that includes both a summative and formative evaluation (Beyer, 1995; Brown and Gerhardt, 2002; Patton, 1994) of the client, coach, client-coach relationship and the coaching process, as well as summative evaluations of the coaching program. The overall aim of this research was driven by the recognition that women across various sectors do not have access to coaching or a leadership related network whether because of their socio economic and cultural background or the type of workplace/civic role they undertake. The purpose of this paper is to evaluate the effectiveness of a coaching program for women from various organizational backgrounds, with the aim of highlighting the significance of coaching as a powerful tool for diversity, equity and inclusion amongst women in their workplaces. We believe that the role of coaching can help better support the holistic well-being of women from diverse backgrounds and help us understand the full range of factors that underlie women's decision to accept promotion or not as well providing valuable insights into the dynamics at play within their workplaces. It can also help better support the overall well-being and health of both coaches and coachees. Our report shows the findings of an evaluation of the process of designing and delivering the first phase of the service and to move to evaluate the impact. This research builds on an emerging evidence base (Friedman et al, 2017; Hunt et al, 2018; see Social Mobility commission Report- 2018-19) that demonstrates that women fail to reach their potential in both public/community and corporate life, particularly those from working class and diverse backgrounds who have little or no access to a leadership related network. Interviews and data collected from our sample of women revealed that coaching is the key in helping them to make conscious choices and become more inclusive and take actions to make their organizations more equitable. Moreover, Our, initial evaluation of the coaching program has highlighted that coaching is a key activity in the management development, talent management and performance improvement of women leaders across the Greater Manchester area (Pankhurst, 2019).

## THE UPPER ECHELONS THEORY – THE HRM PERSPECTIVE

**Kidron, Aviv**

Department of Human Services, Department of M.A. in Organizational Consulting, The Max Stern Yezreel Valley College

### ABSTRACT

In today's business environment, organizations have come to relying more on the top management team in order to influence on firm performance (Bass, 2019; Tanikawa and Jung, 2019). Hence, although IHRM headquarters in the MNCs' parent country is a central actor, the area receiving the most research attention at this level usually dealt with HR policies and practices, but neglected analyzing the central actor itself (Welch and Björkman 2015). According to Hambrick's (1994 2007) Upper Echelons Theory, IHRM headquarters can be considered as one of the organization's top management groups (TMGs). However, little is known about how IHRM headquarters as TMG organize and structure themselves to meet these challenges.

Hambrick (1994) first coined the concept of *top management team behavioral integration* in his Upper Echelons Theory. Top management groups (TMGs) play a key role in shaping work processes and influencing organizational outcomes (Alderson, 1993; Lubatkin *et al.*, 2006) and in dealing with the process of ongoing globalization (Nielsen, 2010). A well-designed and functioning TMG is one that is behaviorally integrated (Hambrick, 1994). Moreover, TMGs must pay attention to the contextual content and the consequent output of its shaping (Johns, 2018). Given this, more work is necessary regarding the makeup of TMG dynamics and its work context (Carmeli, 2008), especially role of top HRM executives. According to the *Upper Echelons Theory* (Hambrick, 1994 2007), the challenge of this study is to extend our understanding of IHRM headquarters as one of the TMGs and its organizational context. Hence, this study may thus provide important insights and create an understanding of integration processes and the organizational context that can be applied in IHRM headquarters, as one of the TMGs, and that may contribute to the successful achievement of competitive strategy needs of international businesses.

### RESEARCH METHOD

Face-to-face semi-structured interviews were conducted with twelve HRM senior HR managers from different advanced international technology companies. Coding and data analysis were performed using the process suggested by Miles and Huberman (1994).

## FINDINGS AND DISCUSSION

The findings illustrate a cross-level phenomenon that contributes to understanding the contexts of IHRM headquarters. The starting point was IHRM goals that relate to all HRM functions, which require integration for their realization. Goal clarity increases coordination among TMG members and provides both a strategic and a motivational focus (Vasilaki and O'Regan, 2008).

The organizational level includes two themes: *The matrix structure and shared values*. TMG reflects work processes and company structure (Hambrick and Mason, 1984). This study raises initial thinking about the impact of the organizational structure on integration in IHRM headquarters. While the organizational structure is challenging in creating integration in HRM headquarters, shared values that support integration may facilitate this process. Leadership recognition in creating an information sharing culture is very important (Martinho *et al.*, 2016). Additionally, shared values facilitate cooperation between colleagues, thereby leading to mutual trust (Yu *et al.*, 2015).

Furthermore, the IHRM headquarters level includes two themes: *Strategic IHRM and trust among IHRM members*. First, in an international business context with multiple national settings, TMGs integrate the diverse perceptions and orientations to create core competencies and develop a global strategy (Hambrick, 1998 2007). Since IHRM headquarters play a key role in developing the HR strategy, this strategy may serve as a framework for integrating the IHRM's policy and practices. Second, trust was found to engender successful cooperation and synergistic team relationships (Kidron *et al.*, 2016). This finding stresses the importance of the relationship between goal interdependence and trust among IHRM members.

Finally, a well-designed and functioning TMG is one that is behaviorally integrated (Hambrick, 1994 1998). Two integration devices - *behaviors foster integration and HRM integrative technology* exist side by side, each strengthening internal integration according to its advantages. Information sharing and collaboration provide the TMG with a broad set of insights that sensitize a variety of inputs (Simsek *et al.*, 2005) that may help them make strategic decisions. HR information systems are an essential component for competent management of HR and act as a prominent integration device for effective management of organizations (Anitha & Aruna, 2014; Aruna, 2015). In this sense, HRM experts who take part in those communities of practice share a meaningful experience, knowledge, and information (Tansley, 2005), and as a general rule increase their collaboration.

## PRACTICAL IMPLICATIONS

The HR department obviously plays a key role in developing HR policies, tools, processes and intended practices (Kradjova-Stoven & Mujtaba, 2016). Integration in IHRM headquarters should be

based primarily on a clear and shared goal. If IHRM headquarters would like to coordinate and integrate their activities, there should be a shared understanding of the situation.

The increasing fragmentation of HRM work must include how the HRM is reorganized and disordered within and outside its boundaries (Caldwell, 2008). In this respect, the IHRM headquarters' members play a role in directing and coordinating HRM practices, considering the organizational structure.

IHRM headquarters should be based on a HR strategy and should embrace a climate of trust. IHRM headquarters may play a key role in the planning and execution of an integrative IHRM strategy through using integration devices. Concurrently, integration devices cannot be conducted without mutual trust between members of the IHRM headquarters.

## THE ROLE OF PSYCHOLOGICAL CAPITAL AND SOCIAL CAPITAL IN FOSTERING ORGANIZATIONAL PERFORMANCE

### ABSTRACT

#### THEORETICAL BACKGROUND

One of the biggest challenges faced by HRM is to encourage employees to invest their resources for the benefit of the organization (Knies et al., 2017). Resources have intrinsic value, and therefore may form an excellent basis for flourishing in the workplace and optimal performance (Gorgievski et al., 2011). Nowadays, while no processes are maintained without the valuable contribution of an experienced individual, the importance of the human factor is remarkable (Isik et al., 2015).

Drawing on the *conservation of resources* (COR) theory, which has become a fundamental theory in the emerging field of positive psychology (Hobfoll, 2011), we propose that positive human capital resources such as psychological capital (PsyCap) and social capital are likely to influence perceived organizational performance (POP) through organizational trust as a mediator and proactive behavior as a moderator. PsyCap and social capital are two distinctive resources, or, as Burt argues that "while human capital refers to individual ability, social capital refers to opportunity" (1997: 339). Focusing on those two types of resource as part of a greater dynamic process provides a comprehensive theoretical framework for an active and positive psychological perspective in the world of work (Gorgievski et al., 2011), in terms of our understanding of its impact on the POP in the public sector. Considering that the question of whether and to what extent HRM contributes to performance has been prominent on the research agenda, there is a relative lack of research on HR in the public sector in developing countries (Knies and Leisink, 2018). Hence, our study advances the HRM literature in the public sector by exploring how personal and social resources enhance POP across government agencies.

This study extends the findings of previous research through two major contributions. First, until now relatively little attention has been dedicated to investigate the relationship of PsyCap and social capital with POP in the public sector context. In the public sector, the question how public servants' resources enhance POP is the subject of considerable pragmatic and empirical debate (van der Kolk et al., 2019). Underscoring this research gap, our first objective is to explore the impact of those two resources on POP in the public sector. Second, this study provides substantive insights into the mediating role of organizational trust and the moderating role of proactive behavior. To our

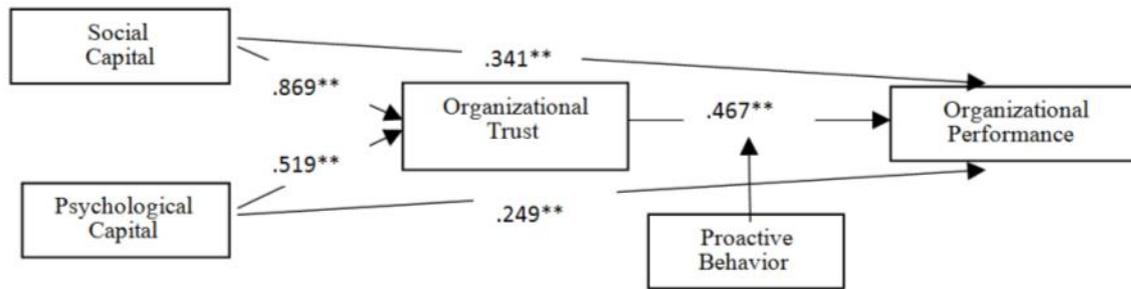

knowledge, no studies have investigated the organizational trust as a mediator between PsyCap, social capital and POP in the public sector. Additionally, we extend our argument by exploring how proactive behavior moderates the relationship between organizational trust and POP.

## METHOD

The survey was conducted among public servants at the managerial level. An online survey was conducted through iPanel which is the largest online panel in Israel. Survey data were collected at two chronological points separated by two months. Pairing the questionnaires between the two waves provided complete data for 298 participants (a total response rate of 54.18%). All the scales were taken from standardized instruments that were found reliable in earlier studies.

## RESULT

The results show that there are positive significant correlations among all the research variables. Collinearity was tested before conducting the regression analysis using variance inflation factors (VIFs). Since the tolerance level was greater than 0.10, we ruled out multicollinearity (Hair et al., 1998). The result suggested that the effect of PsyCap on POP decreased in absolute size (from  $B = .341$ ,  $p < .01$  to  $B = -.065$ ,  $p > .05$ ) when controlling for the effect of organizational trust. Additionally, the results indicate that the effect of social capital on POP decreased in absolute size (from  $B = .249$ ,  $p < .001$  to  $B = .034$ ,  $p > 0.05$ ) when controlling for the effect of organizational trust. Results from the Sobel tests showed that the mediation effect is significant for (Sobel test statistic = 4.52,  $p < .001$ ). We also hypothesized that proactive behavior would moderate the relationship between organizational trust and POP. As found, the overall model was statistically significant,  $F_{(7, 155)} = 7.51$ ,  $p < .001$ ,  $R^2 = .25$ , meaning that the relationship between PsyCap and social capital and POP is mediated by organizational trust and moderated by proactive behavior. The model was able to account for 25 percent of the variance. The significance of the indirect effect was tested using bootstrapping procedures. Unstandardized indirect effects were computed for each of 5,000 bootstrapped samples, and the 95% confidence interval was computed by determining the indirect effects at the 2.5th and 97.5th percentiles. The bootstrapped unstandardized indirect effect of organizational trust and proactive behavior was .21, and the 95% confidence interval ranged from .10 to .36. This indirect effect was statistically significant.

## DISCUSSION

First, the findings provide valuable knowledge about the way psychological and social resources (Luthans et al., 2018; Hobfoll, 1988) do affect POP. By drawing this relationship, this study advances theory on potential valuable positive psychological resource that may lead also to increase organizational performance and not only individual job performance. According to the COR theory assumption that resources do not exist individually, and personal and social resources must operate in tandem to aid people's efforts in facing life challenges (Hobfoll, 2011a; Hobfoll et al., 2018).

Second, this study also fills a gap about the mediating effect of organizational trust between PsyCap and social capital to POP. Arguably, this study provides substantive insights to Nahapiet and Ghoshal's (1998) argument that resources could be mobilized through the social network so they enable the achievement of certain ends. While there is an expectation of trustworthy behavior and the intention to act based upon it (Huff and Kelley, 2003), it enables public servants to utilize both their personal and social resources for achieving organizational performance.

Finally, one of the original contributions of this study to HRM literature is the introduction of a mediation moderation model in which the strength of a mediating pathway is moderated by another variable (Hayes, 2013; Karazsia et al., 2014). Therefore, we support previous studies which have suggested that integrating mediation and moderation can offer a more complete understanding of a phenomenon than focusing solely on mediation or moderation (Karazsia, et al., 2013; Cafferkey et al., 2019).

## THE IMPACT OF GRATITUDE ON THE EMPLOYEE INTENTION TO STAY: THE MEDIATING ROLE OF AFFECTIVE COMMITMENT

**Kirse, Sigita; Adomaviciute, Karina; Dikcius, Vytautas; Norkunaite, Ruta**

Marketing department, Vilnius University, Vilnius, Lithuania

### ABSTRACT

In developed markets, the search for skilled employees is becoming more difficult. Moreover, it is more complicated for the companies to maintain the high level of employee motivation and benevolence, intention to stay with the organization. At the same time, recent research shows that loyal employees work to make the organization flourish (Narteh and Odoom, 2015), whereas employee satisfaction and loyalty can determine customer loyalty (Barzoki and Ghujali, 2013). If the company cares about its employees, the employees will care about the customers, which will in turn increase profitability of the company (Herington *et al.*, 2006).

As a result, researchers are becoming increasingly interested in the poorly analysed relationship between internal marketing and employee loyalty (Narteh and Odoom, 2015). Barzoki and Ghujali (2013) found a significant positive impact of internal marketing on an organizational commitment. Furthermore, the research by Schulz *et al.* (2017) confirmed, that internal marketing is a significant factor predicting affective commitment. Moreover, the improved employee satisfaction through the proper implementation of internal marketing principles can have a positive effect on increasing job satisfaction (Shiu and Yu, 2009; Iliopoulos and Priporas, 2011; Salem, 2013; Chiu *et al.*, 2014), organizational commitment (Barzoki and Ghujali, 2013; Chiu *et al.*, 2014; Schulz *et al.*, 2017), work performance results (Huang and Rundle-Thiele, 2014; Shiu and Yu, 2009), loyalty (Bansal *et al.*, 2001).

There is a growing number of researchers who believe that gratitude can effectively serve as a marketing tool through employee affective commitment (Palmatier *et al.*, 2009; Ragio *et al.*, 2013; Bolton *et al.*, 2004). Bolton *et al.* (2004) argues that marketing tools that encourage employee affective commitment have a direct impact on the duration of the relationship or the intention to stay. The relationship marketing literature increasingly addresses the importance of gratitude as an emotional relationship builder and active internal marketing element (Raggio *et al.*, 2013; Mishra, 2016), a strong factor that can trigger affective employee commitment (Tsang, 2007).

The purpose of this paper is to examine the impact of gratitude on the employee intention to stay when the relationship is mediated by the affective commitment. Following internal marketing tools are considered as the drivers of the employee gratitude: internal communication, employee training, employee salary, intangible benefits.

Online survey and non-probability (convenience) sampling were used for this study, which is based on a survey of 129 respondents from Lithuania.

The study found a significant positive relationship between employee affective commitment and gratitude. Multivariate regression analysis revealed that intangible benefits comparing with other internal marketing tools, specifically internal communication (Conduit and Mavondo, 2001), employee training (Anaza and Rutherford, 2012), employee salary (Anaza and Rutherford, 2012), had the strongest effect on gratitude. The study also found a significant positive relationship between affective commitment and intention to stay within the company. Thus, this study confirms that the emotion of gratitude can serve as an effective marketing tool for internal communication within organizations to maintain employee loyalty through the stay with the organization.

## REGISTRATION AND PROMOTION OF MONUMENTAL OLIVE TREES IN GREECE

**Koniditsiotis Stavros**

Msc of Cultural Policy and Development, Open University of Cyprus, OUC, Latsia, Cyprus

### **ABSTRACT**

The present study is a part of a wider research on the value of the natural heritage and specially on ancient olives trees as natural monuments and cultural heritage of all Mediterranean regions.

According UNESCO "natural features consisting of physical and biological formations or groups of such formations, which are of outstanding universal value from the aesthetic or scientific point of view; geological and physiographical formations and precisely delineated areas which constitute the habitat of threatened species of animals and plants of outstanding universal value from the point of view of science or conservation; natural sites or precisely delineated natural areas of outstanding universal value from the point of view of science, conservation or natural beauty".

The main aim of our research is to examine the key position that monumental olive trees and their materialistic and symbolic manifestations consist a natural and cultural heritage as well. In this framework the study focuses on various key issues related to monumental olives trees and their natural, historical, social and cultural value.

Since ancient times, olive trees have been a means of covering various needs of people. Despite the time passing and human intervention, many olive trees have survived. These are the so-called monumental olive trees, which are distinguished for their massive surface, the caverns and their trunk. In our country the monumental olive trees are protected by the P.D. 1971. Various public or private organizations are involved in their promotion and protection. An important role in this direction is played by local communities play an important role towards this direction with their traditions, and with the help of the citizens themselves. Many of them acknowledge the existence of monumental olive trees in their area and realize their importance, so they try to have an active role in their promotion and protection.

An olive tree must meet certain criteria to be considered monumental. These criteria are divided into two major categories, morphological and cultural characteristics. Tsaroucha points out that the classification of a tree has raised strong concerns in the scientific community and local community. It is worth mentioning that the morphological characteristics of an olive tree include the shape and size of the trunk, the olive wood, the formation of its caverns and, finally, its age. The evaluation of an olive tree usually begins by measuring the perimeter of its trunk, which gives it some

cultural texture. In addition, other tangible features play an important role in the evaluation of a tree. The tangible values of olive trees are visible and are usually calculated on the basis of measurable data. Tangible ones include the particular species of olive trees, the size combined with their age, the impressive shape of its trunk and anything else that can attract the attention of an observer. Finally, morphological characteristics may include species rarity and endangered species. Cultural characteristics include all the elements that relate the olive tree to the mythology, tradition, history and religion of a society. These characteristics are not quantifiable, but place the researcher in the broader time frame of the tree's existence, contributing to linking the past with the present and the future. In order to protect monumental olive trees effectively, it is important to understand how people perceive their importance to the local community. This importance lies in their diverse values, namely cultural, symbolic, aesthetic, educational, scientific and spiritual. The benefit of these non-tangible values is that man comes closer to nature. However, some trees carry historical / mythological elements. The final judge, always taken into account for the designation of an olive tree as monumental, is always the olive tree itself and its character. The olive tree and its cultivation since its appearance, 50,000 years ago, are still part of the economic, religious, social, political and cultural life of an area. In the olive groves you meet long-lived olive trees, which can exceed a thousand years. These trees stand out morphologically for their size, their outer and bulky surfaces, their internal caverns and their trunk relief. Many olive trees are also culturally linked to the history, mythology, religion, traditions and culture of the local communities in which they are found.

The protection and promotion of olive trees has proven to be an important pillar for the country's cultural heritage. But research should not stop there. Local communities should be made aware of and understand the importance of the culture of these olive trees to the history and traditions of their land. Initially, the local communities and associations that operate in them should, with the help of interdisciplinary teams of archaeologists, agronomists and philologists, record all olive trees locally and form complete dossiers with all the necessary information for each olive tree. Government agencies should then be interested in and support the inclusion of these olive trees in the list of protected nature monuments.

Finally, the process of registering olive trees in the National Inventory of Intangible Cultural Heritage should begin immediately. The National Inventory aspires to be a valid and up-to-date image of Greece's intangible cultural heritage by offering communities, groups and individuals the opportunity to share their own cultural experiences with local and international audiences, to talk about their collective identity, formulate proposals for the study, and especially for the preservation of their intangible cultural heritage.

## RETAIL BANKING: CHALLENGES AND EVOLUTIONS IN DIGITAL TRANSFORMATION

Krasonikolakis, Ioannis<sup>1</sup>; Eng, Teck-Yong<sup>2</sup>

<sup>1</sup>Kent Business School, University of Kent, Medway, UK

<sup>2</sup>Henley Business School, University of Reading Malaysia, Johor, Malaysia

### ABSTRACT

The traditional banking model of the last century was set up around the physical exchange of documents. For centuries, individuals had to visit a brick-and-mortar branch in order to interact with a bank. This enabled banks to have direct contact with their customers and to identify their needs through this contact. With the development of electronic and other forms of commerce (e.g. m-commerce, TV-commerce, 3D-commerce, etc.) consumers come in contact with financial products and services without the need for physical presence. Thus, on the one hand, new space is being created for the development of new banking providers (e.g. FinTech) and on the other hand, the traditional banking structures miss the opportunity of almost exclusive contact with the customer. This advantage of direct contact has passed on to all stakeholders, thus all involved parties need to recognize and respond to the newfangled challenging environment, in order to ensure sustainability and market share retention.

Digital banking through the use of websites and mobile applications (e.g., Monzo, Revolut) is changing the way nowadays banks interact with their customers. The use of digital technology in online media (platforms) provides instantaneous solutions to customers and businesses. In a five-year study (2013-2017) conducted for four major US banks with an international presence (Pramanik *et al.*, 2019), the results show the dynamics of the field and the trends of the past that is current practice: (1) the number of mobile payments exceeds 3 billion every week, (2) a new and award-winning digital (mobile) bank platform attracted 5,500 new users daily, increasing eventually the number of users by 22 million, and (3) a bank of 40 million 'digital' customers has reduced transactions compared to the physical stores by 130 million and increased the electronic transactions by 180 million within two years.

In recent years, large multinational technology-focused companies have penetrated in the online payments sector, and new companies focusing on the provision of financial services are constantly emerging. FinTech already exert pressure both on the traditional banking sector, as well as on regulatory frameworks. In the USA, the legislative framework encourages the establishment of new banking architectures strengthening the continuous change in the development and provision of financial services (Berger, 2003). FinTech through real-time interaction with the customers can better understand their needs and react accordingly due to the simplification of their processes. FinTech has

been "attacking" traditional banks with digital "weapons" by attracting their customers' base. (CapGemini, 2016)

Traditional banks have recently started to develop a digital transformation strategy in order to respond to the changing environment. The adoption of digital technologies within an organization directly affects internal and external processes and services, interactions of the involved parties, reshapes relationships with customers, and the overall value creation approach. However, digital transformation should not always be disruptive (Furr and Shipilov, 2019). Following the theory of value creation, we focus on the new opportunities and perspectives that emerge from the adoption of a digital transformation strategy, with an emphasis on how new technologies transform the relationships of the Banks with the customers and other entities involved.

In sum, the aim of this work-in-progress is to provide an holistic framework that describes all relevant processes and activities that take place in the digital transformation in retail banking, and inform managers in terms of the opportunities, challenges and initiatives that they need to focus on and prioritize. Drawing on literature insights (Jüngera and Mietzner, 2019; Reinartz *et al.*, 2019) and interviews with more than 20 Bank managers that will take place in April-May 2020, we will offer a better understanding on how brick-and-mortar banks need to respond to the recent trends.

*Keywords: digital transformation, retail banking, omni-channel banking*

# A DISTANT THREAT MADE LOCAL? THE CARRY-OVER EFFECT OF PERCEIVED THREAT FROM ASYLUM SEEKERS IN EUROPE TO ISRAELI LOCAL OUTGROUPS

Lissitsa, Sabina<sup>1</sup>; Kushnirovich, Nonna<sup>2</sup>; Aharoni, Matan<sup>1</sup>

<sup>1</sup>School of Communication, Ariel University, Ariel, Israel

<sup>2</sup>Department of Economics & Management, Ruppin Academic Center, Emek Hefer, Israel

## ABSTRACT

The purpose of this study was to identify sources and hidden mechanisms of distant perceived threat creation through content analysis of Israeli media coverage of EU asylum seekers (EUAS) and to investigate the effect of perceived threat on attitudes toward local outgroups: Israeli Palestinians, Non-Israeli Palestinians, and Asylum Seekers in Israel, controlling for face to-face interaction with these groups. The study used mixed methods. Qualitative Study 1 consists of a content analysis of Israeli media coverage of EU asylum seekers. The sample included 213 media items that were broadcasted on Israeli TV programs, printed newspapers, radio broadcasts, online news websites, and social media from 2014-2019. Quantitative Study 2 uses an online survey of 1311 Israeli Jews, to investigate effects of distant threat on attitudes toward local outgroups. The findings of the qualitative analysis indicate mainly negative EUAS coverage in Israeli media. Realistic threat from EUAS was negatively related to positive attitudes toward three local outgroups, while the association between symbolic threat from EUAS and attitudes toward the local outgroups was insignificant. Considering that perceived distant threats are originated predominantly from the coverage of asylum seekers crisis in EU in Israeli media, we conclude that how migrants are described, categorized, and represented makes a difference. The media actively contributes to and constructs our perceptions of EUAS, shaping a society's image of local outgroups and minorities, with vast political and cultural implications. Hence, escalation of the EU asylum seeker crisis may aggravate the Israeli-Palestinian conflict, tightening legislation regarding asylum seekers in Israel.

## THE PROCESSES OF CHANGE IN THE MANAGEMENT OF THE BRAZILIAN FEDERAL UNIVERSITY HOSPITALS

Lordello, Heloísa<sup>1</sup>; Caria, Ana<sup>2</sup>; Oliveira, Lídia<sup>2</sup>

<sup>1</sup>Departamento de Ciências Contábeis e Finanças, Universidade Federal Rural do Rio de Janeiro, Rio de Janeiro, Brazil

<sup>2</sup>School of Economics and Management, University of Minho, Braga, Portugal

### ABSTRACT

In Brazil, the citizens equal right of access to health care was only explicitly recognized in the Federal Constitution of 1988, with the creation of the Unified Health System (*Sistema Único de Saúde- SUS*) that is the public subsector of the Brazilian health system.

Federal University Hospitals (FUHs) are part of the public health care services (article 45 of Law No. 8.080, of September 19, 1990), are dependent on the Ministry of Education and are funded by the SUS. FUHs provide services to the population, even in high medical complexity situations, and develop teaching and research practices while committed to train health professionals (Portulhak *et al.*, 2017). The complexity of these institutions, along with the need to provide high quality services, ends up making management performance particularly challenging in these organizations.

To face the lack of resources and the growing financial and human resources deficit observed since 1980s, the Ministry of Education, together with the Ministry of Health, created the Federal University Hospitals Restructuring Program (Programa Nacional de Reestruturação dos Hospitais Universitários Federais – REHUF). REHUF was instituted by Decree 7.082, of January 27, 2010 and creates the material and institutional conditions for FUHs, having as guidelines the establishment of appropriate funding mechanisms, the improvement of management processes, the adaptation of the physical structure, the modernization of the technological park, the restructuration of human resources and, the improvement of teaching, research and extension activities, as well as health care.

Additionally, Law 12.550, of December 15 of 2011, created the Brazilian Company of Hospital Services (Empresa Brasileira de Serviços Hospitalares – EBSEH) to manage, on a voluntary basis, university hospitals. EBSEH is a public company of private law that is intended to increase efficiency and improve economic and financial sustainability of FUHs. Therefore, EBSEH provides supporting services to the management process of FUHs that sets performance targets, deadlines and qualitative and quantitative indicators to be achieved. The network of FUHs is comprised of 50 assistance units linked to 35 federal universities, and of these hospitals, 40 chose to sign the management contract with EBSEH (EBSEH, 2020).

The main objective of this study is to analyze the institutional dynamics of FUHs and the implications in accounting that arise from the adoption of REHUF and the creation of the EBSEH, exploring the reasons, actors and processes that have been shaping the performance of these public entities.

This qualitative study follows an interpretative approach and uses the New Institutional Sociology (NIS) as lens. NIS emphasizes that technical motivations and economic rationales do not completely explain why organizations adopt certain practices, highlighting the advisability of organizations adhering to external rules, norms, beliefs, and taken-for-granted assumptions that legitimize and provide an appearance of rationality and efficiency (DiMaggio and Powell, 1983; Scott and Meyer, 1991).

FUHs are open systems that operate in a complex, collective and interconnected environment. In order to survive, these hospitals have to be responsive not only to the internal pressures but also to the external pressures that shape their structure and behavior, which may lead them to become increasingly homogeneous. Also, to analyze the relationship between agency and FUHs, this study follows the developments to NIS provided by the Institutional Work (Lawrence and Suddaby, 2006; Lawrence et al., 2011). Institutional Work examines the “practices of individual and collective actors aimed at creating, maintaining, and disrupting institutions” (Lawrence et al., 2011: 52).

Research design included the collection and analysis of the minutes of the Higher Councils of Universities’ meetings, since the decision of the HUFs to join the EBSEH management had to be taken at those meetings. Once the reasons for adherence and non-adherence by the social actors involved in the process were identified, a multiple case study was developed.

From the FUHs that joined the EBSEH, the Hospital chosen as a case study was the University Hospital of Brasília (HUB) of the University of Brasília, which is considered the EBSEH Pilot. From the 10 hospitals that did not adhere to EBSEH, 3 university hospitals linked to Federal University of Rio de Janeiro (UFRJ) were selected: Institute of Psychiatry of UFRJ (IPUB), School Hospital São Francisco de Assis (HESFA) and Institute of Childcare and Pediatrics Martagão Gesteira (IPPMG).

Besides the minutes of the University Councils, the documental analysis included: consolidated financial statements and explanatory notes of EBSEH; Management Reports of HUB and EBSEH; EBSEH Audit Report; Internal Regulations of EBSEH; the Report on the organizational structure of the HUFs and the basic quantitative of EBSEH employees; and the Report of the Audit Judgment of the Federal Court of Auditors.

Data was also collected through semi-structured interviews in the selected four HUFs and in EBSEH. Sixteen semi-structured interviews were carried out: ten in HUB (an adherent FUH), one in IPUB, two in HESFA and one in IPPMG (three non-adherent FUHs), and two interviews in EBSEH-Headquarters. The interviews were transcribed and the speech of the involved actors was analyzed.

The triangulation of data allowed the analysis to reveal the interaction of different voices that emanate from the organizational context and the institutions.

The results show that a top down strategy has been adopted in the change process; that the process lacked transparency and had contradictory information; that the EBSEH and the Government exerted pressures that lead Universities to join EBSEH and; that the Uniform Administrative Law servers, and other social actors, resisted the process and delayed its implementation. Resistance, however, was not enough to stop the process. Legislation, and recommendations of the Federal Audit Court, exerted institutionalizing pressures on the FUHs. Though, some of the laws had a ceremonial use leading to loose coupling. In addition, it was verified that the management carried out in the FUHs not only reflects the government's search for legitimacy, but also the search of efficiency in the control of public resources. The results also reveal that the changes in the accounting system of the adherent hospitals were very relevant, and that the accounting information of these units, although incomplete, is used as a form of legitimization. Finally, the research has shown that some rules and standards have been instituted in accounting and institutionalized in FUHs. With the implementation of the ERP-Management Application for FUHs, the current practices were discontinued and deinstitutionalization occurred.

This research contributes to the literature on the management change on the public health system, through the study of the Brazilian case. It also deepens the analysis of the creation of EBSEH and the understanding of the behavior of organizational actors in complex institutional environments and their compliance and resistance to institutional pressures.

### ABSTRACT

When the Brundtland Commission proposed the notion of Sustainable Development (SD) in 1987, it aimed to enlarge the vision of development in a more inclusive and durable way. SD imposes that economic development is also concerned with environmental and social aspects such as the quality of natural resources, climate change, and the struggle against poverty. SD regards both political actions as well as individual and organizational behaviors. In this context, the integration of social and environmental goals into the purpose/mission of corporations gave birth to the concept of “triple bottom line” (Elkington, 1997).

The need for a common framework of values (and goals) that steers individual, managerial and political action initially triggered the Millennium Development Goals (MDGs), a political agenda defined by the United Nations Millennium Declaration in 2000. Even though MDGs helped to define the objective of SD thoroughly, they were not capable of involving all countries and organizations in the struggle to effectively modify the economic behaviors of people and corporations (Sachs, 2012). To relaunch the action towards SD, the General Assembly of United Nations adopted a new important resolution on 25 September 2015, by means of which it proposed the so-called Sustainable Development Goals (SDGs), a new common framework defined to enforce the efforts to improve the development models adopted by people and corporations. The SDGs explicitly adopt the triple-bottom-line and concern the social, environmental, and economic aspects of development, implementing a unitary view of this concept. The 2030 Agenda for SD states 17 sustainable development goals, that includes 169 targets, and aims to stimulate global action for the next years.

SDGs engage individuals, organizations, and governments in a common struggle, and they potentially involve all human activities. Consequently, corporations can be protagonists of SD by integrating SDGs into their strategies and business models. Nonetheless, the adoption of SDGs is entirely voluntary. In this framework, many issues arise regarding the motivations for adoption, the alignment between SDG-contribution and business strategy, and the SDGs reporting practices.

Academic attention towards the corporate involvement of the SDGs has been growing during the last years. Several studies (Scheyvens, Banks and Hughes, 2016; Kolk, Kourula and Pisani, 2017; Muff, Kapalka and Dyllick, 2017; Bebbington and Unerman, 2018; van Zanten and van Tulder, 2018; Rosati

and Faria, 2019a, 2019b; Williams, Whiteman and Parker, 2019; Schönherr and Martinuzzi, 2020; Tsalis et al., 2020) address the relationships between the adoption of the SDGs in corporate reporting practices worldwide. Empirical evidence identifies many types of determinants of SDG reporting. On the one hand, empirical evidence shows that at the organizational level variables as, company size, internationality, intangibility, voluntary commitment to sustainability disclosure frameworks, external assurance of reporting practices, and board composition variables are determinants of SDGs reporting (van Zanten and van Tulder, 2018; Rosati and Faria, 2019b). On the other hand, the institutional frameworks in which the companies operate also determine SDGs reporting. Variables identified at the institutional level are the levels of climate change vulnerability of the country in which the companies operate, the national corporate social responsibility frameworks, the levels of indulgence and individualism, the levels of market coordination, employment protection frameworks, power distance and long-term orientation (Rosati and Faria, 2019a). There are some determinants related to the nature of the SDGs addressed by companies; for example, internally actionable SDG targets are more attractive for company engagement than externally actionable SDG targets. In the same way, SDGs that avoid negative impacts on sustainable development are preferred as SDGs that require a proactive “doing good” approach (van Zanten and van Tulder, 2018). Finally, very intriguing evidence provided by Williams and colleagues (2019) shows that inter-organizational dynamics play an essential role at the individual level as antecedents of companies’ endorsement of the SDGs.

In the case of Italy, the study of Venturelli and colleagues (2019), provides the first and only empirical evidence available regarding the corporate SDG Reporting, consequently to enrich the discussion and to enlarge the empirical evidence, the present research aims to understand the contribution of corporations to SD, by analyzing the declaration of commitments to SDGs and related politics into sustainability reports. To that aim, we perform a qualitative content analysis of 173 stand-alone sustainability reports published by companies Listed in the Italian Stock Exchange in Milan in the years 2016 (N=56) and 2017 (N=117). Our findings show an increment in SDG Reporting from 2016 to 2017, and this can be partially attributed to the Italian implementation of the EU Directive on non-financial disclosure and diversity. Additionally, our results show that in 2016, 21 companies reported about SDGs (37.5% of the sample), while in 2017, there was a reference to SDGs in 40 reports (34.2% of the sample). About 67% of corporations also reported some specific aims about their specific contribution to SD, while the others only cited a generic commitment. The SDGs 7, 8, 9, and 13 are the SDGs more addressed by companies in their sustainability reports substantially confirming the outcomes of van Zanten and van Tulder (2018) that the SDGs mostly addressed by companies are those that include internally actionable targets. Furthermore, the study tests the role that critical economic, financial, and governance variables (such as size, profitability, and gender diversity in the board of directors) in SDGs

reporting and finds that the company size, measured according to the total assets of the company or the number of employees, can be considered a significant determinant of SDGs reporting in Italy.

# MARKETING STRATEGIES AND HUMAN CAPITAL FLOW THROUGH CITIES: A THEMATIC ANALYSIS AND DIRECTIONS FOR DEVELOPING THE FIELD

Marchesani, Filippo<sup>1</sup>; Christofi, Michael<sup>2</sup>; Iaia, Lea<sup>1</sup>; Masciarelli, Francesca<sup>1</sup>

<sup>1</sup>Department of Business Administration, University "Gabriele d'Annunzio" of Chieti-Pescara, Italy

<sup>2</sup>University of Nicosia, Cyprus

## ABSTRACT

During the last decade, the role of human capital and knowledge flow on city development has increased the attention of researchers and institutions. The focus is on the role played by knowledge inputs, knowledge generation, and knowledge spillovers in local innovation processes (Faggian and Mccann, 2009; Lee, Florida and Gates, 2010). Toward this direction, the effect of the internet and social media as a driver of internationalization plays a key role (Bhimani, Mention and Barlatier, 2019; Shawky *et al.*, 2019).

Growing through the development of digital and new communication technologies represents a fundamental channel in terms of economic growth (Lamberton and Stephen, 2016). This expansion is also reflected in cities that become increasingly dependent on digital innovations (Tan and Taeihagh, 2020), and competitive in terms of social policies (Sima *et al.*, 2020). Attracting and acquiring new knowledge has become essential in the city's innovation and technological development policies (Christofi *et al.*, 2019; Vrontis and Christofi, 2019). The theme of the attractiveness of the city, therefore, plays a key role in its technological and economic development. Several studies evaluated the role of city attractiveness in terms of innovation (Snieska and Zykiene, 2015) and national and international students' mobility (Siekierski *et al.*, 2018; Roy *et al.*, 2019). However, the role of marketing strategies in terms of human capital attraction is still not clear in terms of a) governing communication (Cocchia, 2014; Meijer and Bolívar, 2016), and b) with regards to the impact of new digital technologies on communication itself (Leonardi, 2014).

The purpose of the article is to provide a holistic understanding of the role played by city marketing strategies on human capital and knowledge inbound flow as a driver of innovation and economic development. Hence, the guiding research question of this systematic review is: "what marketing strategies do cities use in order to attract human capital and develop new knowledge for the city itself?". Based on this, the objectives of this paper are the following: to (i) conduct a systematic review and critical analysis of extant research so as to offer a better understanding of the phenomenon and a clear picture of the various marketing strategies used by cities; (ii) provide research-based guidelines

on the topic for policy makers, practitioners and, academics, and; (iv) develop an agenda for further enquiry in order for the domain to further evolve.

## ICT AND MICRO FIRMS IN EXTRA VIRGIN OLIVE OIL SECTOR

Marchini, Andrea<sup>1</sup>; Riganelli, Chiara<sup>2</sup>; Polenzani, Bianca<sup>2</sup>; Martino, Gaetano<sup>1</sup>

<sup>1</sup>Department of Agriculture, Food and Environmental Sciences, University of Perugia, Perugia, Italy

<sup>2</sup>Department of Economics, University of Perugia, Perugia, Italy

### ABSTRACT

#### 1. INTRODUCTION

Especially for local, traditional, small enterprises the opportunities for growth offered by the internationalization are increasingly important (Dominguez and Mayrhofer, 2017). The digitalization of their business is an essential part of this process (Westerlund, 2020). Nowadays, the spread of internet connection and integration strategies through Information and Communication Technology (ICT) has permitted to overcome geographical barriers and to improve both businesses and marketing strategies (Scuderi *et al.*, 2015). They also present advantages in terms of reduction of coordination costs (Martino, *et al.*, 2017; Chen *et al.*, 2017). Several studies have analysed the impact of ICTs on the Italian agri-food sector in terms of marketing benefits, use of e-commerce, and social media actions (Sturiale and Scuderi, 2013a; 2013b; Petino and Rizzo, 2003). The current study tries to evaluate the adoption of ICTs for small enterprises (10 employees or less) in the Extra Virgin Olive Oil (EVOO) sector. The small local productions have an important role in the social, cultural, and economic sustainability of rural areas (Galli and Brunori, 2013; Menozzi, 2014). Especially for them, both quality perception and communication are very important to increase the value of their product. Although it is usually done through certifications (Marchini and Riganelli, 2015; Di Vita *et al.*, 2013), the use of Information and Communication Technologies (ICT) enables an easier sharing of information, both within the supply chain and towards the consumer, and encourages internationalization (Violino *et al.*, 2019; Scuderi *et al.*, 2015). The geographical barriers, due to the rural localization and the challenges imposed by the reduced dimensions, could be overcome through these technologies (Westerlund, 2020; Sturiale and Scuderi, 2013b; Scuderi *et al.*, 2015). Therefore, to study the characteristics which could influence the level of digitalization of this type of firms through time, could be important, from both the managerial and the political point of view.

#### 2. DATA AND METHODOLOGY

The following research question was formulated:

- (a) *What are the variables which, through time, have an impact on the adoption of Information and Communication Technologies for Extra Virgin Olive Oil small firms?*

Taking into account the small dimension of the firms and the very low level of digitalization, the only proxies for the ICT adoption are the presence of an e-commerce channel and social networks (Facebook). Due to the fact that fast net is important in both technologies, the variables which affect its implementation were also analysed. The dependent variables were selected among those used by ISTAT in their questionnaire to evaluate the ICT level in firms (<https://www.istat.it/it/archivio/236526>). The data was obtained by matching the information from the database Orbis BureauVan Dijk with that from telephonic interviews made in Italy in April 2020. The firms were selected based on their activity code (ATECO: 10.4.1 and 10.4.2) and the number of employees (10 or less) with active status. The dataset from Orbis for the years 2016, 2017 and 2018 was composed from 107 firms. The final sample after the calls was composed by 100 firms in Italy. The interviewees were asked for the presence of an e-commerce channel, the year of implementation, and the geographical distribution of the sales. The interviewees were also asked for the presence of fast or ultra-fast internet connection (30 Mbps or higher) and, if present, since which year. Some questions about the social networks activity of the firms were done. After a qualitative analysis, the data was analysed with a Generalized Linear Mixed Model (GLMM) using the software R.

### 3. RESULTS AND CONCLUSIONS

The results of the analysis are presented in table 1:

The three models chosen are those that minimize the Akaike information criterion (AIC), but the selection was confirmed by using the likelihood ratio test (Burnham and Anderson, 2002; Bolker, *et al.*, 2009).

For what may concern e-commerce, the fixed effects show that firms which have a certification are expected to have increased odds of having an e-commerce channel. This confirms what can be seen from the literature: certifications are one of the first tools used to communicate quality. The firms which, over the three years considered, have used social networks to spread and gather information are also expected to have increased odds of having an e-commerce channel. Furthermore, from the qualitative analysis can be seen that the use of social networks is positively related with the implementation over the three years of this technology. This is important in relation with the previous studies, which found that the web site was mostly used for the image rather than for sales. Therefore, the current results seem to go in a different way: over the years the representative role was shifted towards the social networks. For what may concern the implementation of a fast net, it influences positively the implementation of the e-commerce channel. Furthermore, the control variable for the technological level (presence of a server) is significant too. The analysis on the social networks shows that variables which are expected to increase the odds of implementing them are certification and fast

net. From the data, fast net is a common important factor. Therefore, a regression on this variable was performed, in order to evaluate which variables could be significant in its implementation. As expected, the geographical variable is rather important, where the coefficients are all negative, and significant for centre Italy. This is important, because the coverage is not homogeneous for the Italian territory and still a work in progress.

Table 1 – Variables which have an effect on the implementation of ICTs

| Variables      | E-commerce        | Social           | Fast net          |
|----------------|-------------------|------------------|-------------------|
|                | Fixed Effects     |                  |                   |
| SALES          | -0.02**<br>[0.01] | 0.09<br>[0.01]   |                   |
| EMPLOYEES      |                   |                  | 0.02<br>[0.06]    |
| CERTIFICATIONS | 5.09***<br>[1.66] | 8.10**<br>[3.43] |                   |
| FAST NET       | 2.66***<br>[0.99] | 2.97**<br>[1.27] |                   |
| SERVER         | 3.80**<br>[1.7]   | 0.92<br>[2.06]   | -0.85<br>[0.58]   |

From the managerial point of view, firms with high quality products (certified) have greater probabilities of have implemented ICTs between 2016 and 2018. The implementation of digital means is one of the most important factors to help the internationalization of the traditional, high quality, small business (Westerlund, 2020), and it is especially true for agricultural enterprises (Scuderi et al., 2015; Sturiale and Scuderi, 2013b). From the political point of view, ICTs technologies are even more important if the new objectives of the Common Agriculture Policy are considered. The use of these technologies will be important to reduce bureaucracy, and to make the operations easier and more transparent, given also the current Pandemic scenario. Therefore, the implementation among small traditional enterprises could be necessary in the next future. The location of these firms is a boundary, because they are usually located in places which cannot be easily reached. The policies should be aimed to resolve this problem to improve the digitalization of these firms.

## THEORETICAL FOUNDATIONS OF REEVES MODEL

**Martins, Carlos; Rodrigues, Paula**

Management and Economics Faculty, Universidade Lusíada – Norte, Porto, Portugal and COMEGI (Research Centre in Organizations, Markets and Industrial Management)

### ABSTRACT

#### PURPOSE OF THE RESEARCH

This research intent to analyse the importance of Reeves, Haanaes and Sinha (2015) model, and the coherence of theoretical support. This exploratory study is an insight through literature-based investigation to develop a general review about the main contributions to this new model to choose the right approach to strategy.

#### THEORETICAL BACKGROUND

Reeves et al. (2015: 5) propose a new model in order to help “leaders match their approach to strategy to the circumstances at hand and execute it effectively, to combine different approaches to cope with multiple or changing environments”. In this sequence, this methodological proposal understands that the environment conditions the choice of the appropriate strategic posture. For Reeves et al. (2015) the competitive environment is conditioned by its unpredictability, malleability and severity (harshness). It is as a result of these dimensions that different approaches to strategy are proposed. Thus, for predictable and difficult to model environments, a classic positioning approach is proposed, by obtaining dimension, differentiation or the development of distinctive resources and capabilities (classic) (Wernerfeldt, 1984; Barney, 1991; Peteraf, 1993; Porter, 1980). In unpredictable and difficult-to-model environments, an adaptive posture is desirable through continuous experimentation (adaptive) (Schumpeter, 1934; Jacobson, 1992; Levinthal, 1992; Kirzner, 1997; Sull, 2009; McGrath, 2013). On the other hand, when there is the possibility of modeling the environment, and the environment is predictable, a visionary approach, based on the creation of new markets, or on their disruption (visionary) is advisable (Hamel, 1996; Kim and Mauborgne, 2005) . As a penultimate possibility, when there is great unpredictability and the environment is malleable, a modeling approach through collaborative relationships (shaping) is suggested (Palmar et al. 2010; Bradenburger and Nalebuff, 2002; Hagel III et al., 2008).

## CONCLUSIONS, CONTRIBUTIONS AND LIMITATIONS

Some of the main conclusions and contributions can be summed up in the importance of defining different approach models to strategy depending on the competitive environment and the business life cycle (Beinhocker, 1997; Harrington, 2005; Bingham et al., 2011). Second, the finding that the competitive advantage will become predominantly temporary, distancing the author from classical conceptions and theories (IO / RBV). Finally, the need for “internal fit” for each different approach to strategy is confirmed (Miller, 1992; Porter, 1996; Siggelkow, 2002). The limitations of the model focus on the choice of the two central concepts that condition the correct approach to strategy - unpredictability and malleability. This model departing theoretically and conceptually from previous developments, such as those proposed by Harrington (2005), Bingham et al. (2011) or Bryant (2011), faces gaps that require further complements.

## WHAT WE KNOW AND WHAT WE SHOULD KNOW ABOUT STAKEHOLDERS' INVOLVEMENT FOR SUSTAINABLE INNOVATION

Mazaj, Jelena; Picone, Pasquale Massimo; Mocciano Li Destri, Arabella

Department of Economics, Business and Statistics, University of Palermo, Palermo, Italy

### ABSTRACT

#### SETTING THE SCENE AND STATING THE PROBLEM

“Sustainability is becoming a driving force of economies and societies” (EU, 2019). Correspondingly, scholars have recognized sustainability as a central theme both from an intellectual perspective and a practitioners' viewpoint (Lüdeke-Freund, 2010).

Introducing sustainability in the business world implies considering it as a multi-level concept (Figge *et al.*, 2002) in which each level is co-determined with others. Actually, it encompasses sustainability from a shareholder' perspective (i.e., a focus on market value). Moreover, it takes into consideration the primary stakeholders' perspective that want to satisfy their expectations in long run. Furthermore, it calls attention to well-being and the planetary system. Definitively, it is crucial to identify mechanisms and contexts through which sustainability affects the business world and, more generally, society (George *et al.*, 2016).

Prior literature shows that, frequently, the quest for sustainability requires firms' interactions and combination, and recombination of resources among multiple actors, such as suppliers, customers, higher education institutions, research organizations, and others (Dagnino *et al.*, 2015). Then, each firm acts as a “change agent” by orchestrating diverse resources and knowledge toward an articulated problem (Ferraro *et al.*, 2015; George *et al.*, 2016). We are introducing, *de facto*, the *helix innovation model* (involving business, university, government) by stressing the centrality of firms in igniting the processes for sustainable innovation.

In the past decade, scholars have conceptualized an advancement of the Triple Helix innovation, i.e., the *quadruple helix model*, by adding civil society into the list of knowledge actors (Carayannis *et al.*, 2012). This more advanced version of triple helix leverages knowledge dispersed among stakeholders, fostering high degrees of democracy in knowledge exchange and innovation, and changes in power relations in this context (Jensen and Sandström, 2011). Recently, scholars updated also the quadruple helix model by including ecological content in the helix model. The new model is labeled the *quintuple helix model* (Carayannis *et al.*, 2012). The latest model represents an advancement of the preexisting quadruple helix framework as they include multiple groups of stakeholders and civil society among

the actors considered. It highlights the role of stakeholders' involvement, in terms of co-creation and responsibility, in promoting and implementing sustainable innovation.

Overall, an extant literature acknowledges that the quest for sustainability is a key driver of the quintuple helix model and, accordingly, we can find a *copious* research on firm's dialogue with stakeholders for facilitating sustainable innovation (Ayuso *et al.*, 2006). Nonetheless, such literature is *fragmented* in linking and mapping diverse norms and "glocal" actions, and to fill in an existing governance and participation gap, that allows to leverage diverse expertise and decentralized flexible structures (Bäckstrand, 2006).

## AIM OF THE RESEARCH

The purpose of this paper is to summarize the existing knowledge on the role of stakeholders' involvement in promoting and implementing sustainable innovation. The initial outcomes of this paper is to identify main cooperation objectives and stakeholders' involvement, in order to develop a framework of dynamic sustainable innovation practices. Then, we can structure a platform for future research and distill managerial implications.

## METHODOLOGY

This paper offers a systematic literature review. We collect papers available on SCOPUS database. Specifically, our research is updated at 28 of February, 2020. We select papers on the basis of the following steps. First, we search in title, abstract and key words the following strings: ("sustainable innovat\*") or ("innovat\*" and "triple bottom line") or ("innovat\*" and "hybrid organi\*") or ("innovat\*" and "hybrid corporation") or ("innovat\*" and "quadruple bottom line") or ("innovat\*" and "quintuple bottom line") or ("innovat\*" and "stakeholder\*"). Second, since Scopus includes papers published from the year 1966 and our research focus (i.e., "innovations related to sustainability") is a fairly new topic in management (Cillo *et al.*, 2019), a right truncation is not applied, a left truncation is included – the year 2019. Third, we apply the following limitations: (1) Subject Area: Business, Management and Accounting; (2) Language: English; (3) Document type: Article, (4) Source type: Journal, (5) Publication stage: Final. Fourth, we restrict our analysis to articles published in journals with at least 3 starts of the AJG 2018. The overall outcome is 361 articles. Fifth, we read all abstracts with the goal to select only the papers that contribute to understand the role of stakeholders in sustainable innovation processes. At this point, we perform the analysis of our data base by identifying for each paper: year, authors, journal, conceptual perspective(s), definition of innovation, definition of sustainability, definition of stakeholders' involvement, method, sample, findings.

## EXPECTED CONTRIBUTION

This paper offers a map of stakeholders' cooperation objectives and involvement practices for sustainable innovation. Then, our first contribution is to link different research to connect copious and fragmented literature. Second, we propose future map for investigation on sustainable innovation by involving stakeholders. Third, we develop a set of implications about how firms can leverage on stakeholders' involvement to promote sustainable innovation.

## INFLUENCE OF AFFECTIVE EMOTIONS ON VIRTUAL TEAMS

Mironko, Arkadiusz; Rivas, Jaynne

Indiana University East

### ABSTRACT

The main objective of this study is to advance research on how emotions affect virtual team over time and its impact on performance. We use quantitative data to explore the patterns of emotional behavior over an extended period of time. Despite how emotions evolve over time in virtual teams has been studied in the past, but utilizing qualitative data with the inevitable consequences in reliability. While the majority of the field studies have been conducted using student's team working on short term-task. This study provides an opportunity to evaluate virtual teams working in a business project through large data of interactions and performance. We expect to demonstrate that the level of emotions varies over time according to work-related stimulus and that the high level of emotion will drive to a high level of virtual team performance. Our findings demonstrate the dynamic between team affective events and their final performance are correlated and looking deeper into the results we will be able to demonstrate more nuanced relationships between the variables.

## ENTREPRENEURIAL OPPORTUNITY FOR THE POST-COVID19 WORLD

Mironko, Arkadiusz

Indiana University East

### ABSTRACT

Challenged by the Coronavirus pandemic and its economic fallout many businesses large and small are struggling to keep their doors open for business. Even with the new law, the CARES Act, which provided \$376 billion in relief for American workers and small businesses the impact on small companies is already beyond their capacity to keep the door open. Even the government's support package is no match for a lack of customers. Besides the promise which the CARES Act and Paycheck Protection Program offered banks run out of the money available through the legislation by April 16th<sup>1</sup>, therefore, leaving many stranded to deal with the economic slow down on their own.

The challenges to small businesses are tremendous even under normal circumstances (Fitchen, 2019). The problem is precipitated by the fact that the majority of small businesses are basically income replacing activities for their founders. Most of the small businesses generate just enough profit to scratch the living but do not allow to build a solid "rainy day" fund. Also, the majority of small businesses require its operators to be out and about having the doors open or go to meet with their clients and job sites which is frequently impossible in the COVID-19 pandemic time.

Individual states and agglomerations within them are affected quite differently by the pandemic. Globally we see the same picture and we can go over many reasons why both developed and developing countries are so strongly affected (Stiglitz, 2010) by this virus. With the global economic slowdown upon us, we need to draw the lessons on how small businesses can return to their operations. The entrepreneurial spirit is alive and well, however, the entrepreneurs need to reframe their strategies on how they will start anew.

### NEW OPPORTUNITIES AHEAD

Indeed this pandemic will cause many businesses to fold. On the other hand, as things will improve there will be many more rising opportunities ahead. Those that manage to cease this challenging time and make something new of it will succeed. Current thinking, however, will not help the business as usual to persevere. The new thinking, ability to spot new opportunities, and pursuing these opportunities will enable the success of many. Bootstrapping is important here for most companies large and small the restart will be slow.

---

<sup>1</sup> Source: <https://www.bizjournals.com/washington/news/2020/04/16/sbas-349b-paycheck-protection-program-officially.html>

No one should think of returning to business as usual, people should put their thinking hats on and think as if each and every day is a new opportunity and how not to become complacent. I want to recommend a few steps here on how entrepreneurs should view the new post-COVID-19 business world:

1. Forget what worked well before, challenge every idea
2. Open yourself to new ways, new opportunities, do not try to revive what was and is gone
3. Think of how to bootstrap your business
4. Identify business opportunities that will arise. They are here already and will continue to develop, keep your eyes and ears wide open
5. Think of diversifying your offerings
6. Plan ahead on how will you respond to new challenges
7. Train yourself and your people to try new things and new ways
8. As soon as possible, set up a rainy day, week, month, even a year fund
9. Do not settle into a new routine

One of the many lessons that this pandemic provides is that we can not think of returning to the old ways. We need to develop better habits to survive this type of downturn and succeed in the future. To be successful in the downturn times each business needs to have its rainy day fund as the present scenario proves that relying on government aid is not adequate, not timely, and often not sufficient. Every small business must have a bootstrapping plan not only for the start-up stage but also for the economic downturn, and the recovery stages as well. The question, how to operate the business sustainably, so it can function in every economic climate, should be on the minds of each entrepreneur.

In general, no old or new theory of entrepreneurship can provide answers to make things go away or happen (Dobbs and Hamilton, 2007). Disciplined planning and execution combined with ingenuity can have a tremendous impact on the future of small businesses, our communities, cities, states, and the country. It can also impact the global economy as no business today can operate in its own “back yard” we need supplies, services, and raw materials that come from many places around the world.

This situation although terrible for many will be an opportunity for many recovering and new entrepreneurs as well. Assessing one’s skills and strengths and deploying them strategically will be important here. This is a time when I can confidently paraphrase one of my favorite economists, Joseph Schumpeter who wrote of the process of creative destruction which is taking place now. In his view, the available resources should be used by those who can utilize them most efficiently. We need every efficiency we can find now and leverage it to our own and collective good.

In the past weeks, we have seen failures of governments around the world to proactively provide necessary medical and personal protective equipment and instead botch even the basic guidance to its citizens on how to protect ourselves. More encouragingly we have seen the ingenuity of individuals in their homes making protective gear, ventilators, and disinfectants often even giving it away for free. That is the American spirit which I am sure will allow us to rise from the ashes of this pandemic and rebuild our communities and our economy.

A black swan event is some type of extreme which is hard to anticipate. But one who has a good understanding of global complexity should be able to observe the early signs of the approaching black swan event. Finally when the rare event takes place thinking of the unknowable, relying on experts, can be the only way forward. Today as the government debates another round of financial stimulus entrepreneurs and accidental entrepreneurs, those that were thrown into this economic climate have plenty of opportunities ahead of them. They just need to be able to see around the corner, spot the need that businesses and customers have. It is not going to be the world as usual but those who test and implement their new ideas may reach for the stars. Looking at this black swan event and the reshuffle that it caused we will be able to spot the new stars of a small business growing large again in hopefully a not so distant future.

## CORPORATE GOVERNANCE AND RISK MANAGEMENT: THE CASE OF THE PORTUGUESE BANKING INDUSTRY

Mota, Carlos<sup>1</sup>; Pereira, Adalmiro<sup>1</sup>; Vaz, Ângela<sup>2</sup>; Vaz, Carina<sup>3</sup>

<sup>1</sup>Management, ISCAP-PPorto, CEOS member, Porto, Portugal

<sup>2</sup>ISCAP-PPorto, Andrade & Brandão, Lda member, Porto, Portugal

<sup>3</sup>ISCAP-PPorto, Porto, Portugal

### ABSTRACT

This study assesses the effectiveness of corporate governance mechanisms to control bank risk taking in the Portuguese market. Due to the opacity and complexity of the banking sector, corporate governance practices are extremely important to monitor the behavior of managers, and characteristics such as the shareholder's structure, composition, size and leadership of the board of directors, as well as the external auditor, are critical issues to the stability of the financial system in Portugal. To analyze the explanatory value of these corporate governance factors in bank risk taking, semiannual data from a panel of banks were used, in the period between 2009 and 2018.

In general terms, the results suggest that good corporate governance practices maintain a negative relationship with risk taking by banking entities operating in the Portuguese market. Evidence shows that higher levels of corporate governance, as measured by an aggregate index, are associated with lower levels of risk.

Regarding the tests performed on the corporate governance individual components, the results were consistent in some cases (size of the Board, existence of managing shareholders, foreign shareholders and external auditor), characterized by lower risk policies, while in other cases (accumulation of Chairman and CEO functions and independent directors) they were inconclusive. In this regard, the relationship of these characteristics with the risk management of Portuguese banks is still ambiguous.

The complementary objective of testing a relationship between corporate governance and banking performance revealed that the negative association between banking risk and corporate governance ultimately contributes to the improvement of bank performance.

## **FARMER PRODUCER COMPANIES THROUGH THE LENS OF RATIONAL, NATURAL AND OPEN SYSTEMS**

**Mourya, Mamta**

Fellow Program Participant (FPRM), Institute of Rural Management Anand , Anand ,Gujarat, India

### **ABSTRACT**

#### **CONTEXT OF THE STUDY**

Producer organizations are of critical significance to bring economic benefits to the farmers. In India, the traditional form of producer organization (cooperative) indeed showed success, but it was limited to the dairy sector that, too, in some western states of India. Different studies raised issues pertinent to failed "Cooperative movement in India." Based on the recommendation of the "Alagh committee report" submitted in the year 2000, Producer Company (PC) as a new legal form was introduced in 2003 by an amendment in the Companies Act. This amendment was done with intent to address the lacunae by professionalizing producer organization and increasing producer's advantage through collective participation in emerging market economies. Producer Company, as a legal firm, is expected to combine efficiency and professional management of the company form along with the cooperative principles necessitating ownership and participation of and governance by producers.

#### **THE OBJECTIVE OF THE PAPER**

FPC (Farmer Producer Company) as a form of organization is unique because of its structure. This paper explores this new structure of organization for its effectiveness by using criteria from three different models: the rational system model, the natural system model, and the open system model.

#### **METHODOLOGICAL AND CONCEPTUAL APPROACH ADOPTED**

An empirical investigation, adopting qualitative methodology, is carried out to understand the Structure & processes of FPCs. The study sample includes two FPCs selected on specific criteria such as the age of incorporation, business domain. A semi-structured interview was conducted with members, board members, and functionaries of the FPOs; some secondary data was gathered in the form of balance sheets and other archival records.

## CONTRIBUTION

The study elaborates on the structure and process of FPCs for its uniqueness. It also brings in the different dimensions to be taken care of while analyzing FPCs for its effectiveness.

## KEY FINDINGS

This paper identifies measures of effectiveness that can be used as a criterion while analyzing the organizational effectiveness of FPCs. The finding suggests that it is essential for an FPC to analyze its member institution's strength while analyzing FPC for its performance. The role of different stakeholders in the structure and different processes are found critical. Paper also talks about problems and tensions that arise to achieve the competing logics of the Institution.

## ABSTRACT

Given the benefits of inter-organizational stakeholder collaborations, existing studies on inter-organizational relationships have predominantly geared towards the bright sides of such engagements and demonstrated a narrow focus on the challenges of collaborating with various stakeholders. Though relatively fewer scholars argue that collaborations with stakeholders may not always be beneficial for a focal organization (Fang et al., 2011; Noordhoff et al., 2011; Villena et al., 2011), there is still no consensus on why such collaborations succeed or fail. Recently, the studies in the area have called for research that considers different attributes, motives and interests of collaborating stakeholders to make more accurate inferences about the outcomes of stakeholder collaborations (Ozdemir et al., 2017; 19). Against this background, drawing on the stakeholder and resource dependency theories, the initial aim of this study is to understand how diverse types of stakeholder collaborations, including collaborations with primary stakeholders operating within the supply chain and secondary stakeholders operate outside the supply chain, create different types of value (i.e. market- and non-market based) through their effects on value creation for internal customers (i.e. creation of new employment opportunities) and external customers (i.e. creation of new products, processes and eco-innovations). The second objective of this study is to understand to what extent and how a focal organization's resource based power advantages motivate diverse types of stakeholders (i.e. primary and secondary stakeholders) to invest in resources for the creation of value in collaborative new product development engagements. Based on the 5,461 company data from the Spanish Technological Innovation Panel (PITEC) for the period between 2011 and 2013, OLS Regression models were used to test the hypotheses of the study. In line with the hypotheses, the findings show that collaborations with secondary stakeholders including universities and research centres, which operate outside the supply chain and thus are predominantly driven by non-market interests, generate greater influence on non-market based value creation for internal customers

through improved employment opportunities and external customers through increased eco-innovations. Likewise, consistent with the expectations, primary stakeholders, which operate within the supply chain and thus are driven mainly by market based interests, have been influential in enhancing the process innovation for gaining commercial returns. As opposed to our expectations, on the other hand, universities and research centres as the secondary stakeholders with primarily non-market based interests have been more influential in the creation of product innovations that are driven mainly by commercial returns. Interestingly, our results show that when a focal partner organisation has resource based power advantages by accessing to broad range of diversified stakeholder information sources, they could attain greater support from primary stakeholders for the creation of both market- and non-market-based value. The findings highlight that resource based power advantages are effective only for incentivizing primary stakeholders to make resource investments in a collaborative engagement for value creation.

### ABSTRACT

Inter-organizational relationships are credited with offering benefits to participating organizations, and such value-adding partnerships often account for enhanced levels of organizational performance. Importantly, “business actors are dependent not only on one another but also on a broader contextual setting specific to each company and on temporal reality” (Halinen & Törnroos, 1998, p.188). As a result, sudden and revolutionary changes punctuate these periods of relative stability, i.e. instances when the contractual or non-contractual agreements of the relationship may need to be reconsidered. This fluidity of the external environment implies that there is no inherent prescription for a stable, ideal type of inter-organizational relationship. The empirical studies in inter-organizational relationships, however, predominantly view and examine relationships between organizations at the static level, based on a time specific design, and thus overlooking the evolving nature and state of such relationships. Most studies focus either on the role of expectations (e.g. Celuch et al., 2006) or realizations (e.g. Chung et al., 2016) in an organization’s decision of its inter-organizational relationships. Thus, we respond to the call for research on internal and external circumstances that drive changes in inter-organizational relationships in a cross-cultural context (Choi et al., 2019; Jap & Anderson, 2007; Zhou et al., 2015) and contribute to studies which highlight the need for organizations to adjust the nature of their inter-organizational relationships to an evolving reality (Reuer, Zollo, & Singh, 2002; Hite & Hesterly, 2001; Fleming et al., 2016). Without denying the bright side of inter-organizational relationships, this study sheds light on inter-organizational formations that become detrimental to a focal organization’s relational outcomes, thus disrupting its ‘smooth’ relationship life-cycle. Inter-organizational relationships that generate such outcomes are examined through different types of expectations gaps, associated contextual contingencies (i.e. relational embeddedness and power – dependence relations) and organization-level decision responses to these gaps. In particular, the study aims to investigate the following research questions: What are the expectations gaps? How do they develop in an inter-organizational relationship context? How do

organizations respond to them? What contextual contingencies affect these responses? These questions are addressed through a case-based design of seventeen inter-organizational relationship configurations from Chinese and Turkish textile organizations. Case studies lend themselves to a life-cycle 'story' that accounts for the negative aspects of such relationships. We caution about the negative aspects of seemingly harmonious inter-organizational relationships, while fleshing out factors that may enable their emergence. Our results show the emergence of various expectation gaps leads to diverse relational outcomes, which does not necessarily include inter-organizational relationship termination. Furthermore, our study evidences that how expectation gaps detriment inter-organizational relationships depend on power and relational embeddedness between the collaborating organizations.

## TQM AND BUSINESS PERFORMANCE IN THE SPORT BUSINESS SECTOR

Papaioannou, Alkistis<sup>1</sup>; Koronios, Konstantinos<sup>2</sup>; Sioutou Anastasia<sup>2</sup>

<sup>1</sup>Department of Business Administration, University of Peloponnese, Kalamata, Greece.

<sup>2</sup>Department of Sport Management, University of Peloponnese, Sparta, Greece.

### ABSTRACT

#### PURPOSE OF THE STUDY

Research has proven that a major contribution to sport business competitiveness could be attributed to the application of the Total Quality Management (TQM). Moreover, TQM considered to be related to organizational sustainability. TQM techniques promote the quality and the innovation or the employee involvement as well as the financial stability of sport business (Raxhepi *et al.*, 2018). However, research regarding TQM in sport sector is still limited.

The primary purposes of this study were: (a) to determine the extent to which TQM is applied to medium and large sport businesses (in terms of financial status, organizational structure and facilities) in the region of Attica and (b) to examine the relationship between TQM and business performance in the abovementioned organizations as measured by satisfaction levels in relation to Key Performance Indicators such as profit, ROI, sales volume and market share.

#### DESIGN/METHODOLOGY/APPROACH

The authors addressed the research to all sport businesses in the Region of Attica (180 sport businesses recognised by Association of Fitness Clubs Owners). The respondents were 180 experienced managers who were the most knowledgeable regarding complex and multidimensional processes (such as Total quality management methods) and who can respond as accurately as possible. Responses were received from 162 managers of 162 Greek Sport Businesses with a 90 percent response rate. For the purpose of this study a questionnaire developed by Papaioannou and Kriemadis, 2017 based on the reviewed literature on strategic management and business excellence as well as on input and suggestions from reviews offered by a selected panel of experts. The questionnaire provided specific information concerning the TQM in the Greek sport business sector, demographic characteristics of the respondents and managers' perceptions related to the performance of the sport business. The questions were answered using a five point Likert Scale. The content validity of the questionnaire was determined by a panel of experts including academics and professionals in the fields of strategic management, business excellence, sport management research, and sport management. The reliability of the scale was found to be:  $\alpha = .92$ . Also, the particular research used the subjective way of measuring

performance. This means that sport managers were asked to evaluate the performance of their sport business in relation to their current years' objectives, in relation to their last financial years' objectives and finally, in relation to their major market competitors on a five-point Likert scale. On each of the three bases, performance was judged against four criteria two financial (profit and ROI) and two market based (sales volume and market share). The study was a quantitative design and the analysis was exploratory in nature. Descriptive statistics and Kendall correlation were used to examine variables relationship using SPSS software (version 22).

## FINDINGS

From the analysis it is shown that 19 (11.7%) of sport businesses used TQM to a little extent, 53 (32.7%) used TQM to some extent and more than half of sport businesses 90 (55.5%) used TQM to a great and very great extent. Also, there were significant and positive relationships between TQM and business performance (as measured by satisfaction levels in relation to current year's objectives) of sport businesses. More specifically, TQM had a significant and positive relationship with the managers' satisfaction levels in relation to current year's profit ( $r = .587, p=.000$ ), in relation to current years ROI ( $r = .600, p=.000$ ), in relation to current year's sales volume ( $r = .571, p=.000$ ), in relation to current year's market share ( $r = .612, p=.000$ ), and in relation to current year's Total Business performance ( $r = .653, p=.000$ ).

Also, TQM had a significant and positive relationship with the managers' satisfaction levels in relation to last financial year's profit ( $r = .572, p=.000$ ), in relation to last financial year's ROI ( $r = .663, p=.000$ ), in relation to last financial year's sales volume ( $r = .661, p=.000$ ), in relation to last financial year's market share ( $r = .643, p=.000$ ), and in relation to last financial year's Total Business performance ( $r = .650, p=.000$ ) as measured by satisfaction levels in relation to last financial year's objectives. Lastly, the results suggested that TQM had a significant and positive relationship with the managers' satisfaction levels in relation to major market competitors' profit ( $r = .647, p=.000$ ), in relation to major market competitors' ROI ( $r = .718, p=.000$ ), in relation to major market competitors' sales volume ( $r = .697, p=.000$ ), in relation to major market competitors' market share ( $r = .710, p=.000$ ), and in relation to major market competitors' Total Business performance ( $r = .694, p=.000$ ) as measured by satisfaction levels in relation to major market competitors' objectives of sport businesses. The findings of the present study are consistent with previous studies on TQM and organizational performance, in sport sector, business and service sector (Rial, and Carral, 2015; Valmohammadi, and Roshanzamir, 2015; Shafiq *et al.*, 2019), and shows that the extent of TQM which managers of sport businesses exercised is related to their business performance. The present findings suggested that the effective

implementation of TQM practices in the sport sector is of vital importance and reinforce the organisational survival and growth of sport businesses (Rexhepi *et al.*, 2018).

## RESEARCH LIMITATIONS

The study was delimited to the Sport Businesses. Data for this study were only collected from the Sport Businesses and there was no attempt to generalize this information to all sport organizations. The study was also delimited to a questionnaire designed to collect data regarding TQM according to Papaioannou and Kriemadis (2017).

The following were acknowledged as the limitations of the study:

- The honesty, accuracy, and objectivity of the respondents when completing the questionnaire.
- The respondent's level of understanding of the TQM vocabulary.

Follow-up studies should be done to the same sample in three to five years to investigate possible changes in the utilization of TQM process. Areas of further research could also include measuring the impact of TQM on the satisfaction and loyalty of customers.

## ORIGINALITY/VALUE

This study is useful in extending the concept of TQM to the sport sector. The study will be useful in helping managers to their further understanding of TQM process in their respective organization.

*Keywords: TQM, sport business sector, business performance.*

# SIGNALING GENDER DIVERSITY ASPIRATION THROUGH VOLUNTARY TARGETS

**Penter, Marie-Luise**

Chair of International Management, Otto-von-Guericke University, OVGU, Magdeburg, Germany

## ABSTRACT

Corporate gender diversity has seen increasing relevance in academic literature over the last 20 years. A persistent gender gap, especially in top management positions, has been fueling an ongoing debate on demand-side measures to foster gender diversity. There has been increasing public pressure on companies across the globe to increase female representation, not only on corporate boards of directors but also on lower organizational levels. One recent example is the public announcement of Goldman Sachs in early 2020 to only underwrite IPOs in the US and Europe if companies' boards comprise at least one member from an underrepresented demographic group with a focus on women. Goldman Sachs cites observations that companies with at least one female board member outperform peers post IPO (Goldman Sachs, 2020). The wide media coverage of the departure of SAP Co-CEO Jennifer Morgan, who had served as the first and only female Dax30 CEO for 6 months in 2019/20 is another recent example of public debate on corporate gender equality. Coincidentally, this happened shortly before the 5<sup>th</sup> anniversary of the passing of the 'FüPoG' law which promotes female representation at the upper echelons of the largest German firms through a gender quota which has mandatory as well as voluntary elements.

Differences in country legislation have sparked substantial research activity on gender quotas (Kirsch, 2018; Klettner, 2016; Terjesen et al., 2015) with mixed results on the effectiveness of regulatory measures. Studies focus on antecedents of gender diversity, formal and substantial firm actions to signal gender diversity as well as outcomes of gender diversity. Research on mandatory quotas points to increases in female representation (Wang & Kelan, 2013), but also discover unintended side effects such as the appointment of young, inexperienced directors in France and the delisting of companies in Norway to avoid regulatory requirements as two examples (Rebérioux & Roudaut, 2019; Sojo et al., 2016; Wang & Kelan, 2013). Research on voluntary targets has pointed to positive effects for countries such as Australia and the US (Klettner, 2016; Sojo et al., 2016), but has also been associated with decoupling practices (de Anca & Gabaldon, 2014; Mateos de Cabo et al., 2019; Terjesen et al., 2015). Various studies find that enhanced disclosure and reporting requirements of existing gender diversity are a way forward to achieving parity (Guldiken et al., 2019; Sojo et al., 2016) outside of mandatory quotas.

From a theoretical signaling and institutional perspective, understanding firms' individual cost distribution stemming from applicable quota design yields insights into their rational strategic response to quota implementation. The variety of designs observed in the international corporate landscape and the various academic accounts on outcomes and effectiveness make a structured analysis of gender quota literature necessary. We apply a three-step approach to our structured key word search of terms related to demand-side measures to foster corporate gender diversity (i.e. mandatory and voluntary quotas, targets and reporting) within the Web of Science as well as all relevant and substantial management journals in the timeframe of 2000-2020.

Our structured analysis of literature on gender quotas shows that while mandatory quotas have received substantial attention from researchers, voluntary gender targets remain under-researched. This review locates voluntary targets as a gap within existing literature on corporate gender diversity and demand-side interventions. A thorough understanding of existing quota categories will nurture theory building as a foundation for empirical research on characteristics and contextual factors associated with firms' strategic responses to different legislations and eventually gender outcomes. The contribution of this literature review is threefold: firstly, we contribute to the structuring of quota types and associate respective firm responses as well as outcomes thereby identifying gaps in the coverage voluntary quotas. Secondly, we integrate concepts from adjacent fields of political party quotas and CSR reporting to enrich the hitherto under-researched management perspective on voluntary quotas and targets. Lastly, we derive and discuss research gaps relating to voluntary quotas to pave the avenue for research. We introduce the German gender quota as a natural experiment to further our understanding of firms' strategic responses to external gender legislation.

## VALIDATION OF VIDEO GAME INDUSTRY ECOSYSTEM IN THE GLOBAL ECONOMY

**Petrosyan, Anait; Belyaeva, Zhanna**

Ural Federal University named after the first President of Russia B.N.Yeltsin, Yekaterinburg, Russian Federation

### ABSTRACT

Video game industry is one of the fastest growing branches in the global entertainment and media market. The industry evolved as a part of creative (Goumagias et al., 2016) and digital (Ruiz et al., 2018) economies due to its creative components (for example, art and ideas), digital technologies and experience. Global value chain of the industry depends on the development and implementation of technologies, moreover, it releases creative product. The presented research devoted to a comparative analysis of the media and entertainment market industries, and it turned out that the role of video games is growing while impact of others is stagnating. As we observe growing segment of the market it remains unclear whether dynamics of video game industry is conditioned by current uncertainties. Our research is aimed to present key features of the industry intensive research and development, dependence on technological progress and innovation, and the industry itself encourages innovation and the introduction of new business models. We would like to fill in the gap finding interorganisational connections between market participants and their functions.

The significance of understanding the validation powers for the industry is demonstrated by the dynamic in figures, the number of players around the world is more than 2.5 billion people (Newzoo, 2019). The main characteristics of the industry are intensive R&D (Deloitte, 2018), dependence on technological progress and innovations (Marchand and Hennig-Thurau, 2013), and the industry itself encourages innovations and the introduction of new business models (Ruiz et al., 2018). As a result of existent systematic literature review, it was revealed that the video game industry is a segment of the global entertainment and media market, which is located at the intersection of the digital and creative economy.

Our field research helped to pinpoint industry ecosystem, which is twofold: the core industry depends on game developers who cooperate with publishers, and game platform manufacturers. Distributors and retailers deliver products on the market to end user. The role of the state and associations is important because they regulate the industry and create opportunities for its development. E-Sports, virtual reality, and streaming are separate industries, but they influence video games by increasing player engagement and improving the user experience.

The research gap was found through profound empirical literature review of R. Williamson and D. Ridsdale (2019), F. J. Ruiz et al. (2018), M. Gonzalez-Pinero (2017). We have tested data from reports of

gaming associations, consulting and analytical companies and statistical websites applying econometric modeling to forecast trends on video game market exposure. The database includes data from 25 countries in the sample: 14 developed and 10 developing with Russia in 2013-2018. The empirical testing showed that the revenue from eSports is significant for all models. The number of economically active population is crucial in both developed and developing countries. In the model of developed countries, the importance of secure servers and intellectual property protection were revealed, while in the model for developing countries significance of the export of ICT services and the degree of influence of ICT on the introduction of new business models was identified. The general model shows the impact of the level of urbanization, population in age of 15 and 34, employment in knowledge-intensive services, and the export of ICT services. Our assumptions were confirmed by modeling which helped to specify most important economic, technological and social determinants that affect the revenue of the video game industry were detected.

To confirm the results we have also composed aggregated potential of industry development. The index takes into account innovation input, Internet users, mobile subscriptions, export of cultural and ICT goods, number of secure Internet servers, influence of ICTs on new business models introduction, eSports revenue, GDP per capita, urban population, level of intellectual property protection, share of labor force in population and share of people of age group from 15 to 34 years.

The data were extracted from such statistical resources of international organizations and online portals as World Bank Open Data, UIS.Stat, UNCTADstat, Esports Earnings, Global Innovation Index and WEF.

Method of index composition:

1) selected indicators were normalized using formula:

$$I_i = \frac{X - X_{\min}}{X_{\max} - X_{\min}}$$

where  $I_i$  – individual index,  $x$  – estimated indicator,  $x_{\min}$  and  $x_{\max}$  – reference indicators which are represented by minimum and maximum values.

2) integral index was compiled by the method of sum of individual indexes (linear model):

$$I_{\text{int}} = \sum I_i$$

The results reveal that Singapore, the UK, Sweden and Switzerland have the most favorable conditions for the development of video gaming industry. However, it is worth noting, that none of countries was included in the group with “extremely high potential”. Most of them are in the moderate category.

Within the framework of the research on the video game industry impact on society and environment, the activities of gaming companies are studied and distributed according to the sustainable development goals. Companies actions are aimed at the reaching almost all SDGs. Such

gradation as “games – companies – alliances” is revealed, which is unique, since the industry uses different mechanisms to improve the environmental and social situation.

Table 1 – Results of index evaluation

| No | Country      | 2013  | 2014  | 2015  | 2016  | 2017  | 2018  |
|----|--------------|-------|-------|-------|-------|-------|-------|
| 1  | Germany      | 43,71 | 43,85 | 44,33 | 46,31 | 49,38 | 50,69 |
| 2  | Spain        | 33,93 | 33,39 | 34,32 | 36,27 | 37,45 | 37,54 |
| 3  | Denmark      | 47,65 | 47,50 | 47,94 | 51,60 | 54,04 | 60,40 |
| 4  | Switzerland  | 55,38 | 57,62 | 58,94 | 60,86 | 63,35 | 65,65 |
| 5  | Sweden       | 51,32 | 50,99 | 51,86 | 52,90 | 54,01 | 53,96 |

Level of potential:

|  |        |                |
|--|--------|----------------|
|  | 75-100 | Extremely high |
|  | 50-75  | High           |
|  | 25-50  | Moderate       |
|  | 0-25   | Low            |

The main outcome of the work is the evaluation of video gaming potential in studied countries which represents different factors affecting its growth and development. Through the index it is possible to track the dynamics of potential and distribute according the level. Thus, it's crucial to conduct further researches in video game industry using new methods because games are one of the dynamic and important branches in E&M market.

# IMPACTS OF PRODUCT ADVANTAGE AND NEWNESS ON THE NPP RELATIONSHIP: AN EMPIRICAL MODEL

Peyrovian, Banafsheh; Rosenberger III, Philip J.; Cunneen, David

Newcastle Business School, University of Newcastle, Australia

## ABSTRACT

### BACKGROUND

New product development (NPD) is amongst the most significant sources of competitive advantage (Schilke 2014) and capability for firms (Maniak et al. 2014). Ultimately, new products lead to improved NPD performance (NPP) through introducing superior products relative to alternatives (Sandvik, Arnett & Sandvik 2011). Equally, the proficiency with which each activity within the NPD process is executed has a critical role to play in leading to superior NPP (Cooper & Kleinschmidt 2000). However, there is limited understanding of how NPD activities execution (NPD-AE) might translate into superior NPP.

This understanding is especially limited in the case of independent new firms, where there is a dearth of understanding (Marion, Friar & Simpson 2012). New products to emerge from the NPD process may make or break fledgling firms. Independent-new-firm NPD may occur differently (Bolumole et al. 2015). New firms frequently suffer from resource scarcity (Kirchhoff et al. 2007), with potentially negative impacts on NPD-AE (Huang, Soutar & Brown 2004) and, hence, new-firm NPP, survival and growth. Given the recognized importance of independent new firms to economic development and growth (e.g. Klapper, Love & Randall 2015), this study addresses the independent-new-firm knowledge gap of how NPD-AE may translate into superior NPP.

A literature-grounded conceptual model was developed (Figure 1) featuring six constructs: NPD-AE, NPP, product advantage, product newness to the firm (PN-Firm) and product newness to the customer (PN-Customer). Direct relationships are posited for H1-H5. H6, however, posits product advantage mediating the PN-Firm → NPP relationship.

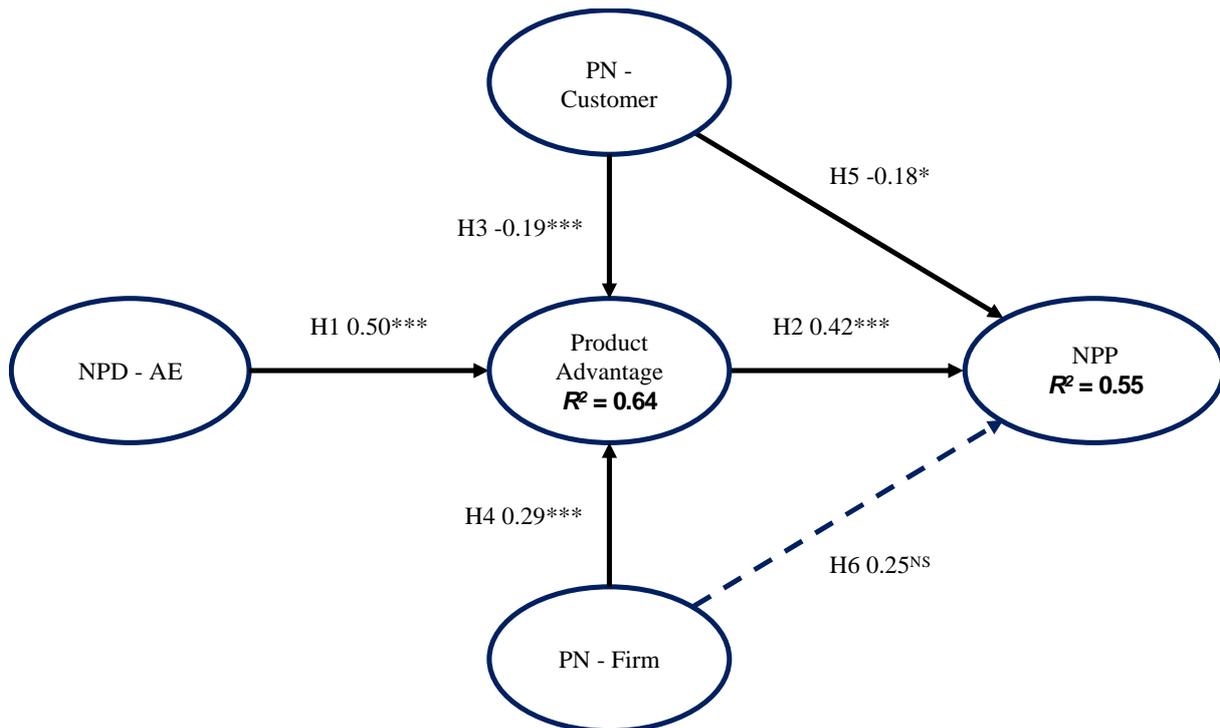

### METHODOLOGY AND RESULTS

Measures were drawn from the literature. NPD-AE was modeled as a formative-formative construct and NPP as formative-reflective. Respondents ( $n = 164$ ) were Australian independent new firms not older than eight years since beginning first systematic sales of their first new product. PLS-SEM

(SmartPLS v3) was used to test the hypotheses. All measurement-model criteria were satisfied (e.g. composite reliability, AVE, discriminant validity).

The findings support all hypotheses, including both the direct relationships (H1-H5) and the mediated relationship (H6), where product advantage was found to mediate the PN-Firm → NPP relationship. The model's explanatory ability ( $R^2$ ) was also good (see Figure 1).

**Figure 1 Conceptual Model and Results**

Note: NS = not significant, \*  $p < 0.05$ , \*\*  $p < 0.01$ , \*\*\*  $p < 0.001$  (2-tailed test); Control-variable effects not shown.

## CONTRIBUTIONS TO THEORY AND PRACTICE

Our conceptual model offers several contributions to theory and practice. Firstly, it proposes a view about how the relationship between NPD-AE and NPP may be enacted, by pinpointing specific roles and impact of three key intermediate constructs – product advantage, PN-Customer and PN-Firm – on NPP. Our model is one of the first to highlight the collective, but separate, impacts of these three critical constructs on NPP, thus also the value of modelling them separately.

Secondly, the findings offer insights into how practitioners may improve NPP. This includes investing heavily in execution of NPD activities to maximise product advantage, which, in turn, should improve NPP. Next, the greater PN-Firm, the greater the product advantage, thus increasing

NPP. Therefore, pursuing more, rather than less, innovative products to the firm may boost firm success indirectly. Finally, the results highlight the critical role PN-Customer plays in product advantage and NPP. Products more familiar to customers (low PN-Customer) provide greater product advantage and NPP. Conversely, products that are very new to customers (high PN-Customer) reduce product advantage, hence negatively impacting NPP. This suggests that firms need to strike a balance between ensuring that innovations that enhance competitive advantage also remain 'familiar' to consumers, through considering such things as customer-oriented design and ease-of-use features.

## CONCLUSION

The results support the model's posited relationships. Limitations include using a cross-sectional, Australian sample. The study contributes to the domain's knowledge, aiding scholars and managers to better understand the importance of the relationships investigated for independent new firms, guiding practice and policy.

## ANTECEDENTS OF SUSTAINABLE INNOVATION: A SYSTEMATIC LITERATURE REVIEW AND FUTURE RESEARCH AGENDA

Prinzhorn, Birte

Chair of International Management, Otto-von-Guericke University, Magdeburg, Germany

### ABSTRACT

Fridays For Future demonstrations have sparked public discussions on sustainable development and renewed pressure on governments to fulfill climate targets. Companies can contribute to solving environmental and social issues in engaging in sustainable innovation, which is generally defined as the development of new products, processes, services and technologies that contribute to the development and well-being of human needs and institutions while respecting natural resources and regeneration capacities (Cillo *et al.*, 2019). Thereby, the terms sustainable, green, and eco-innovation are often used interchangeably, even though the latter ones embrace environmental dimensions while sustainable innovation adds a social one (Ben Arfi *et al.*, 2018). Due to the significance and actuality of these matters, research in sustainable innovation has picked up in recent years.

While initial research focused on the definition and types of eco- or sustainable innovation (Schiederig *et al.*, 2011), recent papers look into the specifics that differentiate sustainable innovation. Thereby, several studies point out that sustainable innovation requires a higher level of cooperation among network partners to develop new products and to ensure eco-friendly characteristics along the value chain. In this context, absorptive capacity and knowledge sharing play an integral role to integrate and exploit external knowledge sources and to manage knowledge transfer and networks (Marchi, 2012; Ben Arfi *et al.*, 2018; Ghisetti *et al.*, 2015; González-Moreno *et al.*, 2019). Similarly, performance measures need to be extended to include non-financial ones (García-Granero *et al.*, 2018). While green innovation usually has a positive impact on environmental performance, the impact on economic performance yields mixed results with innovation aimed at resource and energy efficiency having a positive influence on financial performance while those aimed at reducing externalities might worsen financial results depending on the regulatory environment (Barbieri *et al.*, 2016; Aguilera-Caracuel and Ortiz-de-Mandojana, 2013). Finally, substantial research has been devoted to the determinants of sustainable innovation. At first, they were grouped into four clusters: market-pull, technology-push, regulation, and firm-specific factors (Kunapatarawong and Martínez-Ros, 2016; Horbach *et al.*, 2012; Barbieri *et al.*, 2016; Cillo *et al.*, 2019), but recent studies expand this by investigating the influence of other internal drivers like human resource management and management style (Singh *et al.*, 2020; Dzhengiz and Niesten, 2019).

It is crucial for both, companies and policymakers to get a current and comprehensive understanding of what drives the adoption and success of sustainable innovation to foster it appropriately. However, existing literature reviews are either too old to capture most recent articles or they lack the required breadth (Schiederig *et al.*, 2011; García-Granero *et al.*, 2018; Cillo *et al.*, 2019; He *et al.*, 2018). Consequently, this paper creates a comprehensive overview of the antecedents of sustainable innovation to summarize existing research agreements and to identify contradictions or research gaps. To conduct a systematic literature review, I search for articles that contain the term “sustainable innovation” and other synonyms in their title or abstract in the database Web of Science and filter for articles in SCIE- or SSCI- ranked journals with an impact factor > 1.5 and business, management, and environmental science context. Additionally, I go through recent major business journals and the reference sections of already identified articles to collect additional articles. Finally, I review all abstracts to ensure that the paper concentrates on the antecedents of sustainable innovation.

This review contributes to the literature on sustainable innovation in three ways: (1) It creates a current and comprehensive overview of antecedents of sustainable innovation in the business context; (2) it highlights inconsistencies and contradictions about the influence of determinants; (3) it identifies future areas of research to advance the understanding of sustainable innovation and its success factors. Thereby, the paper provides practical insights for managers into how to create an environment that empowers sustainable innovation.

### ABSTRACT

This research has two purposes: (1) to examine the effect of the consumer-based brand authenticity (CBRA) on brand love and brand hate – and its influence in purchase intention; (2) understanding if the experience in travelling in low cost airline company was a moderate effect between CBRA and brand love and brand hate. It was based on the theoretical perspectives raised on the consumer-brand relationship theory by Fournier (1998). The authors use the case of a well-known low cost airline company in Europe, to empirically test the research model, since there is a widespread acceptance that low cost businesses can either induce to positive feelings, as brand love (Carroll and Ahuvia, 2006; Bagozzi, Batra and Ahuvia, 2017) (as long they address a specific need) or just the opposite – brand hate (Bryson and Atwal, 2019; Fetcherin, 2019). In order to verify this relations the authors tested the model in individuals that have experienced traveling with the airline company.

Amongst scholars there is a widespread agreement regarding authenticity's importance as a concept, nevertheless no commonly accepted definition has been put forward (Becker, Wiegand and Reinartz, 2019). These authors quote the perspective of Beverland and Farrelly (2010, p. 839) signposting "what is consistent across the literature is that authenticity encapsulates what is genuine, real, and/or true". Another term that is at the foundation of the concept of authenticity is brand essence (Brown, Kozinets and Sherry, 2003), which is also supported by Spiggle, Nguyen, and Caravella (2012) that consider preserving brand essence as one of the dimensions of brand extension authenticity and Newman and Dhar (2014) which consider the notion that objects may acquire a special aura or essence from their past which in turn can have a positive effect on perceived authenticity and value.

Data was collected through an online survey evaluating consumer's perception of travelling with a low cost airline company regarding and their views on CBRA, brand love, brand hate and purchase intention. The study follows the two-step structural equation modelling (SEM) methodology recommended by Anderson and Gerbing (1988) using SPSS/AMOS 21 software. We used Putrevu and Lord (1994) scale to measure purchase intention, Ilicic and Webster (2014) scale to measure CBRA,

Zaratonello *et al.*, (2016) scale to measure brand hate and Bagozzi, Batra and Ahuvia (2017) short scale to measure brand love. 5-point Likert scales measured all the variables range between "Totally Disagree" (1) and "Totally Agree" (5).

A total of 200 valid questionnaires were collected. To the question "Have you ever travelled on Ryanair?" 92.5% answered yes and 7.5% no. This question was considered as a moderator question in the conceptual model. 45.80% of the respondents have less than 35 years, 30.0% have between 35 to 44 years, 21.0% have between 45 to 54 years and the rest of the respondents have more than 55 years. 47.0% of the respondents are female and 53.0% male. To evaluate the measurement model, we performed a confirmatory factor analysis (CFA) by maximum likelihood estimation method and Hair's *et al.* (2006) criteria. The measurement model's psychometric values are:  $\chi^2/df = 2.172$ , RMSEA = 0.075, CFI = 0.952; TLI = 0.941; IFI = 0.952. For all constructs, Cronbach's alpha is above of 0.930 and CR values are greater than 0.962 and AVE value are greater than 0.863. All standardized regression weights are significant at  $p < 0.001$ . To test for the validity of the model and the formulated hypotheses, a SEM using maximum likelihood estimation and bootstrapping method was conducted. The structural model's psychometric values are:  $\chi^2/df = 2.385$ ; RMSEA = 0.079; CFI = 0.947; TLI = 0.936; IFI = 0.947, allow us to conclude that the model fit was very good.

The results obtained in the estimation of the proposed conceptual model show that consumer-brand relational authenticity (CBRA) has a negative effect in brand hate ( $\beta = -0.440$ ;  $p < 0.001$ ) validated H1 and has a positive effect on brand love ( $\beta = 0.460$ ;  $p < 0.001$ ) validated H2. The brand hate has a negative effect in purchase intention ( $\beta = -1.165$ ;  $p < 0.001$ ) validated H3 and brand love has a positive effect on purchase intention ( $\beta = 0.257$ ;  $p < 0.001$ ) validated H4. We estimated a moderation effect with the question if the individual have some time travel in the Ryanair (P4) increase the effect of the CBRA on brand hate and on brand love by using the PROCESS SPSS Macro (model 5) to 5.000 bootstrapped samples (Hayes, 2018) for testing the hypothesis H5a and H5b. The results shows that the moderate effect of the travelling before in the Ryanair do not increase the negative effect of the CBRA on brand hate (CBRA $\times$ P4  $\rightarrow \beta = 0.152$ ,  $p = 0.463$ ) and do not increase the positive effect of CBRA on brand love (CBRA $\times$ P4  $\rightarrow \beta = 0.021$ ,  $p = 0.952$ ), and lead us to reject H5a and H5b.

Brands can be viewed as relationship builders since they generate brand love, brand like, brand hate, brand dislike and brand indifference (Fetscherin *et al.*, 2019). The theoretical contribution of this research work is to shed some light into understanding the relationship between consumers' perception of authenticity and how this perception can mediate this relationship in to two opposite directions of feelings: love and hate and induce into consumers' action - the purchase. In an era of social networks feelings towards brands are easily exposed with negative or positive impacts on brand management.

Thus, it is critical to understand how being authentic can induce positive feelings. The results indicated that remaining truthful to one's essence and being authentic induced positive feelings towards the brand such as brand love and increasing purchase intention and decreased feelings such as brand hate. Brand managers should continue to pursue essence and authenticity as a cornerstone of their brand strategy.

## ACKNOWLEDGMENT

This work is supported by national funding's of FCT - Fundação para a Ciência e a Tecnologia, I.P., in the project «UIDB/04005/2020»

### ABSTRACT

The purpose of this research was to examine the effect of brand personality on two related constructs of the consumer-brand relationship – brand love and brand hate – and the effect in purchase intention. The theoretical discussion is based on the consumer-brand relationship theory (Fournier, 1998) which helped to understand the proposed research model.

Consumers often attribute personality traits to brands who have developed a strong emotional relationship (Fournier, 1998; Aaker, 1997). This relationship with the brand can be positive – brand love (Sun and Kim, 2010) - or negative – brand hate. The seminal work of Aaker (1997) was used for the majority of the research on brand personality, however, in this research, we used Geuens, Weijters and de Wulf, (2009) works about brand personality because all the criticisms that Aaker's scale had amongst researchers and because their scale was more adequate to address the study objective. Brand personality definition used in this research is the one from Azoulay and Kapferer (2003, p. 151) that posit "brand personality is the set of human personality traits that are both applicable to and relevant for brands". Several authors show that brand personality plays an important role in final purchase decision when abstract and emotional factors are emphasized to differentiate a brand (Aaker, 1997; Wang and Yang, 2008). As such, brand personality perception in consumer's mind can be changed by positive or negative experiences and their intention to purchase will be also affected (Aaker, 2010; Lin, 2010, Toldos-Romero and Orozco-Gómez, 2015).

For this research, a quantitative methodology was employed. It was used an online survey by questionnaire to measure relationships between constructs on a theoretical model, about Ryanair, in the Portuguese consumers. The study follows the two-step structural equation modelling (SEM) methodology recommended by Anderson and Gerbing (1988). We used Putrevu and Lord (1994) scale to measure purchase intention, we used Geuens, Weijters and de Wulf, (2009) scale to measure brand personality, Zaratonello *et al.*, (2016) scale to measure brand hate and Bagozzi, Batra and Ahuvia (2017) short scale to measure brand love.

A total of 200 valid questionnaires were collected. 45.80% of the respondents have less than 35 years, 30.0% have between 35 to 44 years, 21.0% have between 45 to 54 years and the rest of the respondents have more than 55 years. 47.0% of the respondent are female and 53.0% male. To the question "Have you ever traveled on Ryanair?", 92.5% answered yes and 7.5% no.

We considered the reliability and validity of the scales chosen to measure each of the constructs and, performed a confirmatory factor analysis (CFA) by maximum likelihood estimation method and Hair's et al. (2006) criteria. The measurement model's psychometric values are:  $\chi^2/df = 2.169$ , RMSEA = 0.072, CFI = 0.914; TLI = 0.899; IFI = 0.915. Only three dimensions of the brand personality scale used were validated – conscientiousness, emotionality and aggressiveness. SEM using maximum likelihood estimation and bootstrapping method was conducted to test for the validity of the model and the formulated hypotheses. The structural model's psychometric values are:  $\chi^2/df = 2.205$ ; RMSEA = 0.067; CFI = 0.912; TLI = 0.899; IFI = 0.913, allow us to conclude that the model fit was good. The results obtained in the estimation of the proposed conceptual model show that in respect to BP\_A (responsible and dynamic – conscientiousness) has a negative effect in brand hate ( $\gamma = - 0.195$ ;  $p = 0.002$ ) validated H1. The same occurs in the hypothesis H2, when the BP\_A (responsible and dynamic – conscientiousness) has a positive effect in brand love ( $\gamma = 0.154$ ;  $p < 0.001$ ) validated H2. The BP\_B (emotionality) have a negative effect in the brand hate ( $\gamma = - 0.180$ ;  $p < 0.001$ ) validated H3. The BC\_B (emotionality) have a positive effect on brand love ( $\gamma = 0.769$ ;  $p < 0.001$ ) validated H4. With regard to the BP\_C (dark - aggressiveness), the results show us that have a negative in brand love but are not statistically significant ( $\gamma = - 0.065$ ;  $p = 0.123$ ) rejecting H5. Finally, BP\_C (dark - aggressiveness) has a negative effect in brand hate ( $\gamma = - 0.623$ ;  $p < 0.001$ ) validated H6. The results also confirm the hypotheses H7 and H8, this is, the brand hate has a negative effect in purchase intention ( $\beta = - 1.173$ ,  $p < 0.001$ ) and brand love has a positive effect in purchase intention ( $\beta = 0.260$ ,  $p < 0.001$ ).

As defended by Toldos-Romero and Orozco-Gómez (2015) the importance of brand personality and its effects on purchase intention have not been well establish and acknowledged. This research aims to fulfil that gap, showing that brand personality, mediated by emotional relationship constructs, have effects on purchase intention. For managers it is very important to know that consumers perceive brand personality and that this perception influences the relationship that they establish with the brand and ultimately their decision to purchase or not the brand.

### ABSTRACT

#### PURPOSE OF THE RESEARCH

This research intent to analyse the effect of five dimensions of gastronomic experience (refreshment, involvement/knowledge, hedonic/novelty, meaningfulness and adverse experience) in city destination – Porto – on the happiness and life satisfaction of the tourist.

#### THEORETICAL BACKGROUND AND HYPOTHESES

Chan and Marafa (2013) posit that a multi-dimensional interpretation of places offer a multiplicity of chance to understand the essence of destination branding. In the recent years, brands became value responsible that offer values to several stakeholders. Then, the role of the branding was progressive to become strategic buildings of a long-term value-based relationship with the consumers (Fournier, 1998). In this way, branding can promote the actual name of the location and the way how the place was perceived by tourists (Keller, 2008; Zenker, 2011).

City and destination marketing may be the way to change organisations and consumers attitudes and behaviours' and increase attractiveness across city branding (Lucarelli, 2012; Camilleri, 2018). The search for alternative solutions for the differentiation of tourism destination has been discussed by several authors (Alonso and Northcote, 2010; Camilleri, 2018; Dubois, Cawley and Schmitz, 2017; Quan and Wang, 2004). Then, the gastronomic experience can be a way to differentiate a city or a tourism destination from the competition.

Govers and Go (2009) considers experiences as one important element in the definition of city branding as it is concerned with a multi-sensory, fantasy and emotive aspects of experiential or hedonic products met in a city. The self-determination theory (SDT), developed by Deci and Ryan (2008), posit that the nature of consumer's motivation to participate in an experience, in this case, in a gastronomic experience, can impact outcomes of the experience. Gillet, Vallerand, Lafreniere and Bureau (2013) defends that if the consumer experience was positive, then it may increase the well-being and life satisfaction of the individual. Also Knoblock, Robertson and Aitken (2017) posit that in tourism context, consumer experiences have impact on well-being and quality of life.

Several research have shown that consumers' happiness is connected to live experiences (Bhattacharjee and Mogilner, 2014; Loureiro, Breazeale and Radic, 2019), namely, experiences related to tourism. On the other hand, tourism experience are associated with life satisfaction (Bimonte and Faralla, 2015; Naidoo and Sharpley, 2016; Nawijin, 2016) and happiness (Loureiro *et al.*, 2019). As such, it is to be considered that a consumer satisfied with life is more likely to be happy with a gastronomic experience, in a city destination and, then, we can posit the following hypotheses:

H1: Refreshment experience with gastronomy/food increase the life satisfaction of tourist in destination city

H2: Involvement/Knowledge experience with gastronomy/food increase the life satisfaction of tourist in destination city

H3: Hedonic/Novelty experience with gastronomy/food increase the life satisfaction of tourist in destination city

H4: Meaningfulness experience with gastronomy/food increase the life satisfaction of tourist in destination city

H5: Adverse experience with gastronomy/food decrease the life satisfaction of tourist in destination city

H6: Refreshment experience with gastronomy/food increase the happiness of tourist in destination city

H7: Involvement/Knowledge experience with gastronomy/food increase the happiness of tourist in destination city

H8: Hedonic/Novelty experience with gastronomy/food increase the happiness of tourist in destination city

H9: Meaningfulness experience with gastronomy/food increase the happiness of tourist in destination city

H10: Adverse experience with gastronomy/food decrease the happiness of tourist in destination city

H11: Life satisfaction increase the happiness of tourist in destination city

## **METHODOLOGY**

A quantitative methodology was employed for this research and data collection was done using a structured questionnaire. The study follows the two-step structural equation modelling methodology recommended by Anderson and Gerbing (1988) and using SPSS/AMOS 22 software. The measurement model is developed according to the constructs considered in the theory and then to estimate the causal relations that validate or not the hypotheses raised. The relevant constructs in the theoretical model were operationalised measures from existing literature, advocated by Podsakoff *et*

*al.* (2003) as a procedural method to reduce the common method bias. Questionnaire items were adapted from validates studies to develop a survey measuring. Respondents completed the survey by answering questions on a 1 = “strong disagree” to 5 = “strongly agree”. A total of 338 valid questionnaires are obtain of Porto tourist, in January 2019. It was used the Adongo, Anuga and Dayour (2015) scale to measure the attributes of international tourists’ local food experience, to measure life satisfaction it was used the Diener et al. (1985) scale and to measure happiness it was used the Lyubomsky and Lepper (1999) scale.

## FINDINGS

A confirmatory factor analysis (CFA) was performed by maximum likelihood estimation method and Hair’s *et al.* (2006) criteria to evaluate the measurement model. The measurement model’s psychometric values are:  $\chi^2/df = 2.102$ , RMSEA = 0.057, CFI = 0.944; TLI = 0.927; IFI = 0.945. The results shows a good measurement fit. We considered the reliability and validity of the scales chosen to measure each of the constructs. For all constructs, Cronbach’s alpha is above of 0.646 and CR values are greater than 0.759 and AVE value are greater than 0.614. All standardized regression weights are significant at  $p < 0.001$ . All composite reliabilities are greater than the minimum criteria of 0.70 (Nunnally and Bernstein, 1994). The average variance extracted (AVE) provides evidence of the overall convergent validity of each construct as indicates the amount of variance explained by the construct relative to the amount of variance that may be attributed to measurement error and should exceed 0.50 (Fornell and Larcker, 1981).

Structural Equation Modelling (SEM) using maximum likelihood estimation and bootstrapping method was conducted to test for the validity of the model and the formulated hypotheses. The structural model’s psychometric values are:  $\chi^2/df = 2.102$ ; RMSEA = 0.057; CFI = 0.944; TLI = 0.927; IFI = 0.945, allow us to conclude that the model fit was very good.

The results obtained in the estimation of the proposed conceptual model show that in respect refreshment experience with gastronomy has a positive effect on life satisfaction ( $\beta = 0.138$ ,  $p = 0.033$ ) leave us to accept hypothesis H1. Involvement/Knowledge experience with gastronomy decrease the effect on life satisfaction ( $\beta = -0.099$ ,  $p = 0.019$ ) contrary what was expected and leave us to reject hypothesis H2. Hedonic/Novelty experience with gastronomy/food increase ( $\beta = 0.267$ ,  $p = 0.003$ ) the life satisfaction of tourist in destination city, leave us to accept hypothesis H3. Meaningfulness experience with gastronomy/food do not affect ( $\beta = 0.039$ ,  $p = 0.404$ ) the life satisfaction of tourist in destination city, leave us to reject H4. And adverse experience with gastronomy/food do not decrease ( $\beta = 0.008$ ,  $p = 0.879$ ) the life satisfaction, leave us to reject H5 too. With regard to the effects of gastronomic experience in happiness, the results show that refreshment

experience has a positive effect on happiness ( $\beta = 0.159$ ,  $p = 0.006$ ) leave us to accept hypothesis H6. Involvement/Knowledge experience with gastronomy/food do not increase ( $\beta = -0.008$ ,  $p = 0.830$ ) the happiness of tourist in destination city, leave us to reject H7. Hedonic/Novelty experience with gastronomy/food increase ( $\beta = 0.149$ ,  $p = 0.068$ ) the happiness of tourist in destination city, at 90% of confidence, and leave us to accept H8. Meaningfulness experience with gastronomy/food do not affect ( $\beta = 0.032$ ,  $p = 0.434$ ) the happiness of tourist, leave us to reject H9. And, adverse experience with gastronomy/food decrease ( $\beta = -0.147$ ,  $p = 0.014$ ) the happiness of tourist, as expected, leave us to accept H10. Finally, life satisfaction increase ( $\beta = 0.293$ ,  $p < 0.001$ ) the happiness of tourist in destination city, leave us to accept H11.

## CONCLUSION, CONTRIBUTIONS AND LIMITATIONS

The results shows that the gastronomic/food experience of the Porto tourist only are validate the hypotheses that the experience of refreshment and the hedonic/novelty experience increase the life satisfaction and the happiness of the tourist. The adverse experiences decrease the happiness of the tourist of the city, and finally, the life satisfaction improve the happiness of the tourist in the Porto city. The involvement/knowledge and the meaningfulness experiences with the gastronomy/food are not statistic relevant to improve the life satisfaction or the happiness of the Porto tourist.

This research contributes when providing guidelines and a framework for developing and implementing gastronomic experiences tourism could enable organizations and marketers to optimise the tourism potential of local gastronomy, in a city destination.

The main limitations are the convenience sample, as the data was collected from tourists who, during a certain period, visited the Porto city and the fact that it was only focused on one city.

### ABSTRACT

There is a need for greater specificity in models assessing sports fans' satisfaction, particularly members, i.e. season ticket holders (STHs). To this end, we extend the previous multi-attribute satisfaction studies to posit a six-dimension model of STH satisfaction: club administration, communication, home ground, on-field performance, personal involvement and service. Using a sample of members (STHs) of an Australian A-League football team, we evaluate our STH satisfaction construct in a nomological net as a driver of COBRAs (consumers' online-related brand activities) and behavioural-loyalty intentions., the findings provide initial support for the six-dimension model and its role as a driver of COBRAs and behavioural-loyalty intentions.

### 1. BACKGROUND

Running professional sporting clubs means creating memorable leisure experiences for fans. Therefore, 'customer' (fan) satisfaction is greatly important to clubs (Sarstedt et al., 2014). This is especially so considering the likely outcome of dissatisfied sports fans is to lessen their consumption. Given the multifaceted, experiential nature of the football consumption experience, conceptualising overall fan satisfaction as a multi-attribute, multidimensional model is appropriate (McDonald et al., 2013; Sarstedt et al., 2014). Sport satisfaction studies are often limited to student samples or general game attendees, yet there is a need for greater specificity such that they can be applied to more segmented and exclusive groups, such as members or season ticket holders (STHs) (McDonald et al., 2018).

To this end, this study builds on a multidimensional satisfaction scale specifically developed for football STHs (McDonald et al., 2013; McDonald et al., 2018) designed to assess respondents' evaluations of team activities and services. Their work identified five broad areas that impact STH satisfaction: service to members; on-field performance; personal involvement; team administration; and home-ground quality. From reviewing the literature (e.g. Sarstedt et al., 2014) and current professional-sport practice, we extend this work by adding a sixth dimension: communication. Our

conceptual model (Figure 1) features STH satisfaction as a multidimensional, reflective-reflective hierarchical construct (HOC), with six first-order dimensions: club administration (CA), communication (COM), home ground (HG), on-field performance (OFF), personal involvement (PI) and service (SRV).

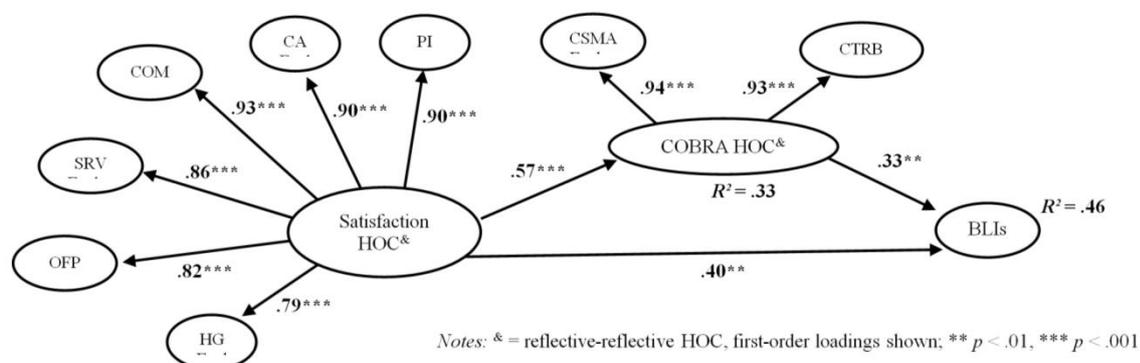

We evaluate our STH-satisfaction HOC construct as a part of a nomological net, that includes behavioural-loyalty intentions (BLIs) and COBRAs (consumers' online-related brand activities) HOC of consuming and creating. Consuming (CSMA) is participating without actively contributing to or creating content, whilst contributing (CTRB) denotes both user-to-content and user-to-user interactions about brands (Muntinga et al., 2011). We next briefly detail the methodology and preliminary results of our STH study.

## 2. METHODOLOGY & RESULTS

Data is part of a larger football-fan study. Measures included STH satisfaction (adapted from McDonald et al., 2013; McDonald et al., 2018) and COBRAs – both reflective-reflective HOCs – and BLIs (Achen, 2016; Muntinga et al., 2011). Age, gender and pre-season-game viewing were controls. An online survey of one A-League club's STHs returned 504 usable responses. Respondents were typically 50 years old, male (79%), owned 3-4 items of club merchandise and attended 8-10 home games in the previous season.

PLS-SEM analysis used SmartPLS v3 (Ringle et al., 2015) with 5,000 bootstraps. HOCs used the repeated-indicator approach. Constructs satisfied relevant criteria: item loading, composite reliability ( $> .80$ ), Cronbach's alpha ( $> .70$ ), AVE ( $> .50$ ), collinearity (inner-model VIFs  $< 3$ ) and Fornell-Larcker discriminant validity. STH satisfaction HOC had a significant, positive influence on COBRA HOC ( $p < .001$ ) and BLIs ( $p < .01$ ). COBRA HOC had a significant, positive influence on BLIs ( $p < .01$ ). See Figure 1.

**Figure 1 Conceptual Model – Preliminary Results**

### 3. CONCLUSION AND NEXT STEPS

The findings provide initial support for the 6-dimension STH satisfaction construct and its importance as a driver of COBRAs and BLIs. Equally, COBRAs were found to influence BLIs. Research limitations include using a cross-sectional sample. At submission time, further analysis and conceptual development is in progress.

# UNDERSTANDING WOMEN'S FOOTBALL MOTIVATIONS AND COBRAS: PRELIMINARY AUSTRALIAN FINDINGS

Rosenberger III, Philip J.<sup>1</sup>; Keogh, Clare<sup>1</sup>; Pandit, Ameet<sup>2</sup>; Holzmüller, Hartmut H.<sup>3</sup>

<sup>1</sup>Central Coast Business School, University of Newcastle – Central Coast, Australia

<sup>2</sup>Newcastle Business School, University of Newcastle, Australia

<sup>3</sup>Department of Marketing, TU Dortmund University, Germany and Newcastle Business School, University of Newcastle, Australia

## ABSTRACT

### 1. INTRODUCTION

There is growing global interest in women's professional sport. Recent research reveals a 48% increase in interest in Australian women's sport for 2019 over 2018, with 53% of Australians now watching broadcasts or attending live women's sporting events (Hytner, 2019), yet women's professional football (Westfield W-League) suffers low attendance numbers. Research has not kept up with this changing landscape. To this end, we posit a model of women's football fan motivations driving COBRAs (consumers' online-related brand activities), which in turn drive commitment and behavioural loyalty (BL). We report preliminary results of a study of Australian W-League fans.

### 2. LITERATURE

We use seven sport-consumption motivation dimensions relevant for the W-League context: team interest, socialising, aesthetics, sport knowledge, football interest, vicarious achievement and excitement (Wang et al., 2011). COBRAs: consuming is participating without actively contributing to or creating content, contributing denotes both user-to-content and user-to-user interactions about brands and creating is actively producing and publishing brand-related content that others consume and contribute to. Customer engagement towards brand media has been found to provide enhanced brand-loyalty explanatory power (Simon and Tossan, 2018). Figure 1 presents our conceptual model.

### 3. METHODOLOGY

Data comes from a larger study. Measures include: motivations (Wang et al., 2011) modelled as a reflective-formative hierarchical construct (HOC), consuming, contributing and creating COBRAs (Simon and Tossan, 2018), commitment and BL (Achen, 2016). Age and gender were controls. An online survey returned 120 usable W-League fan responses, who were typically 31-40 years old,

roughly gender equal (female – 48), owned 3-4 team merchandise items and attended half their team’s home games in the previous season.

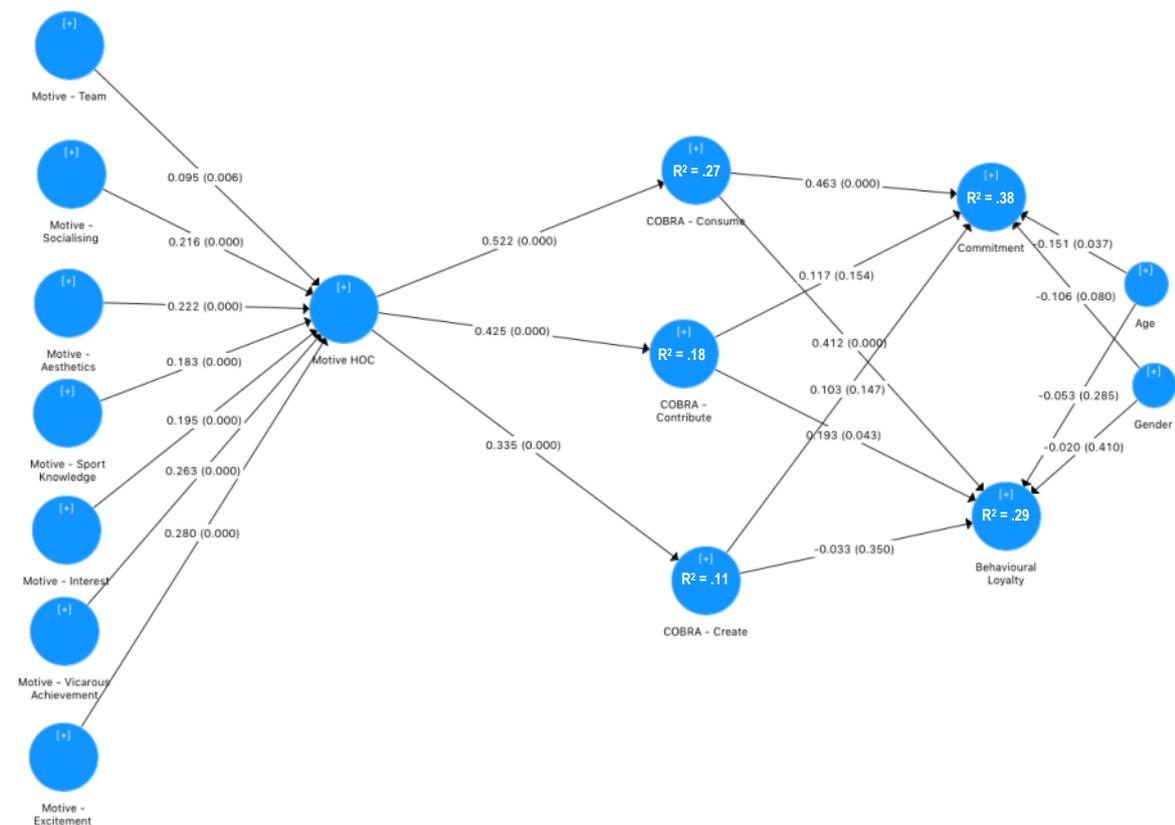

### 4. ANALYSIS & RESULTS

PLS-SEM analysis featured SmartPLS v3 (Ringle et al., 2015), 5,000 bootstraps. Motivations HOC used a repeated-indicator approach. Constructs satisfied composite reliability (> .70), Cronbach’s alpha (> .70), AVE (> .50), collinearity (VIF) and Fornell-Larcker and HTMT discriminant-validity criteria. Motivations HOC had a significant, positive influence on all three COBRAs ( $p < .001$ ). The COBRAs had varying effects on commitment and BL, with consuming significantly influencing both ( $p < .001$ ), contributing influencing commitment only ( $p < .05$ ) but no influence on creating ( $p > .10$ ). See Figure 1.

### 5. CONCLUSION AND NEXT STEPS

The findings support motivation’s importance as a driver of COBRAs. Equally, COBRAs were found to influence commitment and BL, although there were variations. Finally, at the time of submission, further analysis work and conceptual development is in progress, along with developing the discussion and conclusions.

## INTERNATIONALIZATION OF EMERGING MARKET SMES AND DIGITALIZATION: A SYSTEMATIC LITERATURE REVIEW

Runfola, Andrea; Kyrdoda, Yuliia

Department of Economics, University of Perugia, Perugia, Italy

### ASBTRACT

Small-medium sized enterprises (SMEs) are driving forces of the business landscape and are confronted with challenges when going abroad. Compared to large multinationals, the literature has pointed out some specific barriers that hinder SMEs in their international development (Guercini and Runfola, 2015; Hollender et al., 2017; Mahfuzur Rahman et al., 2017). One of the potential opportunities to overcome such barriers and to enhance the effectiveness of their international strategies is nowadays considered digitalization. However, despite the growing interest in this topic, the relationship between digitalization and internationalization is still under-investigated (Katsikeas et al., 2019), especially considering the SMEs case. In this paper, we try to propose an original perspective on this issue. While past research on SMEs has mainly focused on companies from developed markets, this paper focuses the attention on SMEs from emerging markets. The international development of emerging market companies is increasingly attracting the attention of scholars in the business and management domains (Wu & Deng, 2020). The paper contributes to this regard by addressing the following research questions: RQ1) What are the main barriers in emerging market SMEs internationalization? RQ2) How can digitalization affect the internationalization of SMEs coming from emerging markets?

To deal with these research questions, the paper proposes a systematic literature review (Snyder, 2019). The articles included in this review were retrieved in the Scopus and Web of Science databases, taking into consideration the period 2010 – 2020 and the “Business and Management” area. The keywords used for the search were: “internationalization”, “SMEs”, “developing market”, “emerging market” and “digitalization”. To get relevant publications, we made combinations of the terms, for instance: “internationalization” and “developing market SMEs”; “digitalization” and “SMEs” and “developing market”. A set of 79 articles were retrieved. Through a careful reading of the abstracts and keywords of each article, we decided to include 38 papers for this systematic review, that specifically deal with the topics of this research.

The literature identifies barriers of internationalization as a set of both internal to the company, such as resources capacity (Fornes & Cardoza, 2019), R&D investments (M. Rahman et al., 2017), and external such as high costs of transportation (Wu & Deng, 2020), regulation of international operations (Jafari Sadeghi et al., 2019). Within the literature, one of the potential options to overcome barriers is

engaging in innovation activities (Garg & De, 2014). In this context, digitalization can be considered as a way for operating more efficiently in a foreign environment (see as example Jean & Kim, 2019). But in the meantime, the results of the preliminary literature review discovered that the aspect of applying digital technologies for emerging market SMEs to deal with liabilities is limited (Beliaeva et al., 2019). Taking this into account, along with the idea that SMEs are performing international activities differently on the base of their market origin, there is a lack of knowledge that requires more investigations concerning the effect of applying digital tools on the internationalization process. The findings of this research contribute to the international business literature by considering two leading streams of research: international process and digitalization, shedding light on the need to study SMEs, particularly, from emerging markets. Managerial implications of the results are related to the potential implementation of new strategic approaches and tools either to enter new markets or to increase the existing involvement in overseas markets, driving the international development of the company abroad. In this respect, future research should be aimed at the consideration of how emerging market SMEs can integrate technological issues in their international expansion to examine the impact of specific digital tools and the main barriers to overcome in their implementation for their successful use.

## TAKING A HOLISTIC APPROACH TO STUDYING CHANGE

**Sackmann, Sonja, Ph.D.**

Department of Economics and Organizational Science, University BwM, Munich, Germany

### ABSTRACT

Concepts, models and theories of planned change include rational, learning and cognitive perspectives (e.g., Rajagopalan and Spreitzer, 1996) referring directly or indirectly to the pioneering three-phase model of Lewin (Burns, 2004). Nevertheless, the phase of unfreezing has received special attention both in research and practice followed by the phase of changing. The entire process from initiation to the sustainable implementation of a planned change is less frequently addressed (Cummings, Bridgman and Brown, 2016). Hence, the predominant focus lies on the willingness and readiness for change since this is considered one of the most important factors when it comes to supporting change initiatives (Rafferty et al., 2013). Change readiness is generally defined as the cognitive precursor of observable behavior that manifests itself either in a willingness and support for change or in resistance to change. Change readiness includes several factors indicating the probability that a person or organization is committed to and supports change (Vakola 2013).

Even though numerous studies point to the importance of change readiness (Oreg et al., 2011), it represents only one part of an entire change process. As organizational change theories suggest, all phases of a change process are equally important in order to finally accomplish a planned change initiative (Demers, 2007) – including its implementation phase. According to Huy et al. (2014), successful implementation is especially relevant for a planned change project. Only through successful implementation does a change process show its effect (Schwarz and Huber 2008).

In research and practice, however, little attention has been paid to this final phase of implementation that requires developing new routines. Possible reasons may be the constant pressure to change, frequent announcement of new change initiatives as well as the danger that individuals, groups and the entire organization fall back into their old routines and trodden paths (Schreyögg and Sydow, 2010). Since old routines are triggered automatically - especially in stressful situations - they tend to surface despite the knowledge and willingness to practice the newly developed behavior. Furthermore, the last phase of implemented change is often not operationalized (Cummings et al. 2016) and thus ignored or neglected. Reason may be difficulties in its operationalization as well as the research design. Covering a change from its initiation to its final implementation requires a comprehensive conception and operationalization of change and a longitudinal perspective. For this reason, we have developed and operationalized the concept of change-fitness. Change-fitness comprises the concept of change readiness of an organization at different levels as well as its ability

for change. It includes resources required for a change process and the necessary competencies for undertaking and performing the appropriate behavior that makes a change process happen at the individual, the group and the organizational level including contextual variables.

In the presentation, the concept of change-fitness will be further detailed and explained including the data collection instrument that is currently used surveying the change-fitness of companies based in the German-speaking region for the fifth time. Hence, the presentation will be enriched by some of the findings and insights gained from a ten-year study.

## RETROSPECTIVE ANALYSIS AND ECONOMIC BURDEN OF DIABETES MELLITUS: AN APPRAISAL ECONOMIC MODEL

Salvatore, Fiorella Pia<sup>1</sup>; Prato, Rosa<sup>2</sup>; Contò, Francesco<sup>1</sup>; Fortunato, Francesca<sup>2</sup>

<sup>1</sup>Dept. of Economics, University of Foggia, Foggia, Italy

<sup>2</sup>Dept. of Department of Medical and Surgical Sciences, University of Foggia, Foggia, Italy

### ABSTRACT

The aim of this population-based longitudinal study was to evaluate healthcare costs, diabetes prevalence, the onset of complications and the mortality of Diabetes Mellitus (DM) using the Cost-of-Illness (COI) approach on the combination of numerous administrative health databases. All subjects residing in Apulia Region who during the year 2005 had a hospital discharge with an ICD-9 CM code 250.XX, and/or two consecutive prescriptions of drugs for diabetes (ATC code A10XXXX) within one year, and/or an exemption from co-payment healthcare costs specific for DM, were selected and followed up to 10 years. A total of 264,126 eligible subjects in the year 2005 were identified. The percentage of hospital costs on total expenditure has recorded diverse phases over the years, ranging from € 2778.82 in 2006 (72.98%), to € 4060.73 in 2016 (73.79%) and the relative contribution of the other costs increased: pharmaceutical cost ranged from € 895.43 in 2006 (23.52%), to € 1144.70 in 2016 (20.8%), and outpatient costs ranged from € 133.63 in 2006 (3.51%), to € 297.77 in 2016 (5.41%). The model represents a valid decision support for the economic management of the health system and can be effectively applied as a tool both to monitor direct expenditure and to reduce the costs of illness.

### THEORETICAL BACKGROUND

During the past decade, rapid growth in several scientific fields of relevant interest and, in particular, in the area of population-based epidemiological evidence, has encouraged to better explaining the role of diet in the prevention and control of morbidity and mortality resulting from Non-Communicable Diseases (NCDs) (Savelieff *et al.*, 2020). Changes in daily eating patterns and lifestyles occurred with economic development, are having a noteworthy influence on the health and nutritional status of the populations (Ng *et al.*, 2020; Ezzati *et al.*, 2005).

As the availability of food expanded and become more assorted, there have been significant negative consequences in terms of inappropriate dietary patterns, decreased physical activities and a corresponding increase in chronic diet-related diseases (Johnston *et al.*, 2014; Gearhardt *et al.*, 2011). Chronic NCDs, such as diabetes, are becoming increasingly significant causes of disability among

people, placing additional burdens on already overtaxed national health budgets (Goodman *et al.*, 2004).

Diabetes represents not only a major concern in terms of clinical care but also an immense public health challenge. In 2016, over 3 million and 200 thousand people in Italy reported suffering from diabetes, 5.3% of the total population (Lee *et al.*, 2016). Eye, kidney, and cardiovascular diseases disproportionately affect people with diabetes, which involve significant healthcare costs. Although many interventions can reduce the health burden of diabetes, the economic management of health resources is still limited (Weaver *et al.*, 2014). Therefore, evidence is needed to inform healthcare professionals and policy-makers of the costs and benefits of these interventions, and thus, help payers and patients establishing priorities for diabetes prevention and control interventions.

The aim of this population-based longitudinal study was to evaluate healthcare costs, diabetes prevalence, the onset of complications and the mortality of Diabetes Mellitus (DM) using the Cost-of-Illness (COI) approach on the combination of numerous administrative health databases. The model sought to estimate the average annual cost incurred by the Apulia Regional Health Service for the treatment of DM stratified by patients' comorbidities.

## **METHODOLOGY**

DM population was identified through a combination of different datasets: Hospital Discharge Registry (HDR), Cause of Death Registry (CDR), Outpatient Services Registry (OSR), User Fee Exempts Registry (UFER), and Drugs Prescription Registry (DPR). In order to estimate diabetes costs, a unique database matching the records extracted from data sources by using the personal ID number was created.

All individuals, who during the year 2005 had a hospital discharge with an ICD-9 CM code 250.XX, and/or two consecutive prescriptions of drugs for diabetes (ATC code A10XXXX) within one year, and/or an exemption from co-payment healthcare costs specific for DM, were selected and followed up to 10 years. The prevalence, mortality, and healthcare costs (hospitalizations, drugs and outpatient examinations/visits) from the Regional Health Service viewpoint were calculated.

## **RESULTS**

A total of 264,126 eligible subjects in the year 2005 were identified. At the index date, the study population was aged 65-69 (15.47% male and 14.77% female), and 70-74 years (13.68% male and

15.67% female). Only 0.38% of the sample was < 15 years. Different contributions of the three classes of costs (HDFs, pharmaceutical prescriptions and outpatient services) were found in different years. The percentage of hospital costs on total expenditure has recorded diverse phases over the years, ranging from € 2778.82 in 2006 (72.98%), to € 4060.73 in 2016 (73.79%) and the relative contribution of the other costs increased: pharmaceutical cost ranged from € 895.43 in 2006 (23.52%), to € 1144.70 in 2016 (20.8%), and outpatient costs ranged from € 133.63 in 2006 (3.51%), to € 297.77 in 2016 (5.41%).

## CONCLUSION

This study is the largest focused on real Apulian data to estimate, through the COI model, the economic burden of DM and its comorbidities from the Regional Health Service's perspective. Prevalence, mortality, and healthcare costs were assessed on a sample of diabetic patients followed for 10 years.

Merging different administrative databases can provide many data from large populations observed for long periods (Harris-Kojetin *et al.*, 2017; Scalone *et al.*, 2014). This study was effective for its ability to give, in a relatively short time, a quite big set of estimates of the burden of DM, punctually providing information to policy-makers for health planning. The results obtained were comparable to those shown in the studies of Marcellusi *et al.*, (2016) and Scalone *et al.*, (2014) although their analyses were carried out in different Italian regions with territorial, social and demography differences. The model represents a valid decision support for the economic management of the health system and can be effectively applied as a tool both to monitor direct expenditure and to reduce the costs of this disease.

### ABSTRACT

The World Economic Forum has recognized in social innovation a way to be more strategic, more ambitious and more collaborative in facing the most urgent challenges of our time (<https://reports.weforum.org/social-innovation/>).

Social innovation could be interpreted as a complex process (Westley and Antadze, 2010; Oeij et al., 2019) considered by the generation and implementation of new ideas (Mumford, 2002), by organizational and inter-organizational activity (Tracey and Stott, 2017) capable of generating social change. A process involving various facilitators including agencies, institutions and social systems (Cajaiba-Santana, 2014). It represents a tool to operate in depth on the social structure, adopting mechanisms for the redistribution of fundamental material and immaterial resources and for the transformation of social relations, in particular local ones, through an empowerment process (Moulaert, 2009). It is therefore not only the social purpose that characterizes it, but the ability to create new relationships within social life (Mulgan, 2006), to transform the modes of action that underlie the problems themselves (Murray et al., 2010). Another perspective of analysis of social innovation places the concept of social value at the center of the definition, intended as to create benefits for society as a whole (Pol and Ville, 2009; Moulaert et al., 2013).

The paper considers the business model focused on social innovation as a "system of activities" (Bolton and Hannon, 2016) and social innovation depends on the interdependence between these that crosses the company and goes beyond (Zott and Amit, 2010; Cajaiba-Santana, 2014; van Wijk et al., 2019). So, in the analysis framework social change can derive from the recognition of the interdependence and complementarity between company and territory activities, from which a co-creation model of social innovation can derive.

The Territory - intended as a spatial, landscape extension, therefore aggregate of natural and anthropological, tangible and intangible elements - is a place of interactions, social relations, creation and dissemination of knowledge, production of specific skills and resources that cannot be found elsewhere (Kotler and Gertner, 2002). It also recognizes systemic components that have an

autonomous capacity to generate value and expectations in their survival path (Barile and Golinelli, 2008; Barile, 2011).

In this perspective, there is a need to redesign the approach in order to feed ties with local economies, their communities and cultures (Cacciolatti et al., 2015). In a vital context such as the territory, the behavioral dynamic aimed at the shared creation of value has to adopt participatory logics aimed at obtaining consent from the different actors (Iannuzzi, Bassano, 2003). And it is precisely the participatory logic facilitated by the exchange of knowledge (Maizza et al. 2019) that should inspire the path towards the social innovation of a territory because it's made up of structures that recursively stimulate the vital dynamics of individuals, families and organizations in the multiple contexts of the economy, the environment, the society (Elkington, 2013).

So, the research intends to analyze the motivational levers and their most suitable combination to start the path of social innovation shared between businesses and territory.

The applied theoretical model (Fait et al., 2019) identifies some fundamental variables for a shared social innovation process. It is based on a Fuzzy Expert System (FES) approach capable of generating a rating for the evaluation of the motivational system underlying the sharing. The model outlines the pre-conditions necessary for social innovation to go through a process of enhancement of the business-territory relationships. The key concept is that a single system (territory/businesses) arises from the recognition of the resources able to start a joint development oriented towards the creation of identity and vocation and to shape the territorial sphere as an original entity, difficult to replicate (Barile, 2012).

The model will be tested within the companies participating in the agri-food protection consortia, which represent an example of the creation, maintenance and management of organizational networks based on a relational heritage supported by the ambition and the desire to make known a territory, its products, its values and its culture (Maizza et al., 2015).

Following the research question, the theoretical-conceptual framework will facilitate the recognition of the motivational levers representative of the main drivers for the co-creation of social innovation. The research hypotheses deriving from it will be analyzed through a Fuzzy Expert System (FES) (Venturelli et al., 2016), in order to identify intermediate indicators of the phenomenon useful to understand the needed forces to define co-creation strategies of social innovation. The achieved results will allow to reflect on the motivational system that can represent a guideline for any governance that chooses to redesign social innovation in terms of sharing between businesses and the territory.

In particular, the values of the input variables of the social dimension suggest that social innovation cannot be separated from the enrichment of the relational system that characterizes a territory (Landry et al., 2002; Hauser et al, 2007). This is a process that takes place along two dimensions: a) the

regeneration of social capital; b) the harmony between personal and community expectations. Social capital finds the drivers of regeneration in the sharing of values and traditions and in the consolidation of trust among the actors of the territory; while the harmony of the cognitive dimension of social capital is achievable through the maintenance and attraction of human resources having skills in synergy with the values of the territory, as well as with sharing and participation in the planning process of the territory.

## COVID-19 AND THE GLOBAL HIGHER EDUCATION SECTOR: IN SEARCH OF A NEW NORMAL

Shams, S. M. Riad<sup>1</sup>; Vrontis, Demetris<sup>2</sup>

<sup>1</sup>Newcastle Business School, Northumbria University, UK

<sup>2</sup>University of Nicosia, Cyprus

### ABSTRACT

By the end of December 2019, the Chinese Government confirmed the infection of Covid-19 virus in human body in Wuhan province. Since then the Corona virus has been spreading out throughout the world. Initially, the East-Asian countries were listed as the most impacted countries by Covid-19 virus. However China, South Korea and Japan from this region have gradually been lessening the Covid-19 threat quite successfully in comparison to many western countries; the deadly virus has already triggered a global pandemic. Italy, Spain, USA, Germany, Iran and UK are some other countries who have been suffering so gravely for this Corona virus, alongside its blowing impact on all global regions. The number of confirmed and suspected Covid-19 infection and subsequent death has been increasing daily in all continents. By end of March 2020, in these three months, Johns Hopkins University in Maryland reported that nearly seven hundred thousand people are infected by this virus and more than thirty two thousand people have died globally, because of this pandemic. It indicates the severity of this virus, in terms of how appallingly it has been impacting on human life throughout the world.

Governments and civil societies across the globe have been struggling to deal with the changing circumstances resulting from this global massacre. In all sectors, organizational efforts are reached to its peak in an attempt to ensure the normalcy in public life at least to some extent. Especially, the efforts and contribution from the medical sector are truly admirable, considering that the doctors and nurses around the world have been serving the infected patients knowing that this deadly virus could be transmitted to them from the infected patients as well. In several ways, this effort to deal with this global pandemic and the consequent changes in private and professional life since last couple of months has been like no other month in many of our lifetime. But it has also been a time, in which all sectors have shown tremendous commitment, demonstrating what is possible to achieve through dedication and teamwork in a time of crisis. Following the inspirational efforts of the medical sector, all other public and private sectors across the globe have been working hard during this turbulent time, with an aim to mitigate the challenges at the intersection of Covid-19 threat and our daily life.

The global higher education sector is one of these many sectors that has also been working hard to bring back the daily life of students, educators and the aligned stakeholders to a 'new normal' – at least temporarily – as we do not know how long this global pandemic would persist, and at the end of the pandemic, how long it would take to return to the 'customary normal'. The activities delivered especially in the last few weeks in many western universities have been phenomenal. In recent weeks, classroom teaching and all kind of in-person interaction have been suspended almost in all western universities until further notice, in order to reduce the chance of dissemination of this noxious virus from one to another person. However, universities are not closed at all, and are attempting to undertake all possible measures to deliver their regular businesses. As a result, classroom teaching is replaced by online teaching. Thanks to the contemporary information-technology (IT) for its generous progress and contribution to the human civilization. The IT-enhanced virtual platforms have been playing an effective role to help the universities to run their daily operations, including teaching. This transformation has however considerably elevated the workload of IT-staff, educators and other management staff in universities; all staff-members have been working hard to deliver the day-to-day operations of their universities. Instead of classroom teaching, here in the UK, we are now teaching 100% online, based on the following methods:

- all lectures are recorded in Panopto and delivered via Blackboard;
- all interactive seminar materials and solutions are linked to Blackboard;
- through Blackboard Collaboration and Discussion Forum options, students and educators are able to interact online with each other to further discuss the lecture and seminar materials;
- undergraduate and postgraduate research students are regularly interacting with their supervisors through email, and meeting via Skype, Zoom or other online media.

This focussed work in support of the aforementioned IT-enhanced virtual platforms has enabled us to keep our University open for its regular business. At the same time, we are getting used to living our lives in a very different way, working remotely from home at least for the time being, and finding ways to balance this with looking after our own, and our families' wellbeing during this global crisis. On the one hand, during the last week of March 2020, the UK Government has announced that the restriction in public life because of this Covid-19 massacre would prolong for more than six months as we do not know when this pandemic would be clogged. On the other hand, some scientists proclaimed that the Covid-19 virus would remain active in the world around the year, considering that the outbreak would be under control in some part of the world during summer, whilst its impact

on some other part of the world would comparatively be higher where the season will turn to winter. We are hopeful that the vaccine for this deadly disease will be invented and will become widely available soon across the world, in order to permanently eradicate this disease from our beloved planet earth. Until that golden time, like many other sectors, the global higher education sector might need to increasingly adapt with the virtual platforms to run their operations. The positive side of this 'new normal' in universities is it ensures the social-distance between students and educators to reduce the chance of dissemination of Covid-19 virus, while delivering teaching and learning activities. Since Internet use has been increasing in all types of economies and social settings; this IT-enhanced 'new normal' of the western universities would be an effective option for the universities across the globe to run their operations, at least until we return to our 'customary normal'.

# THE IMPACT OF THE ECONOMIC CRISIS ON THE PERFORMANCE OF GREEK TEXTILE COMPANIES

Siamides, Dionysis; Lois, Petros; Repousis, Spyros

School of Business, University of Nicosia, Nicosia, Cyprus

## ABSTRACT

### PURPOSE

In Greece, textile industry has been a cornerstone of production. During the period 1930 to 1980 it was the most important industrial sector, with significant growth rates. After 1980, Greek textile industry has been severely affected by international competition from third countries and high non-wage labor costs.

Today, textile industry in Greece has shrunk dramatically and perhaps more than any other country in the European Union despite the fact that it has a competitive advantage, "Greek cotton".

Textile industry is still an important sector interconnected with agricultural sector, the cotton production. Greece holds the 8th and 9th place in the world cotton market in the last 20 years. Greece is the EU's main cotton grower, accounting for more than 80 percent of total European production (Faniadis, 2019).

This research attempts to examine the impact of the economic crisis on the performance of Greek textile companies by analysing financial statements.

### DESIGN/METHODOLOGY/APPROACH

Textile industry declined by 49.5% from 2009 to 2017 and employment declined by 49.9% for the same period while prospects are worsening (IOBE, 2019). Previous studies examine mainly "how" and "why" of an industry (Kalogirou and Panagiotopoulos, 2015).

According to Bryman (2004), research must be based on two elements, the theoretical background that is relevant to research, and the empirical.

Empirical analysis of this research is based on financial ratio analysis, SWOT analysis of Greek key textile companies operating in the domestic and international market, relied essentially on published financial statement data, collected for the period 2015-2017.

During 2018-2019, cotton production is estimated at 1.41 million bales, up 16.2% from previous season due to favourable weather conditions during harvest and good yields.

According to the Greek Association of Textile Industries (Faniadis, 2019), the Greek textile industry has been suffering during 2018-2019 from increased third-country imports (mainly from China, Pakistan, and Turkey), causing a sector shrank (meaning that financial data were the same or worst than previous years examined in this research).

The sample companies selected up to now in this research, on the basis of differentiation in the field of production as well as years and experience in the Greek industry. The three most important key companies in the sample are small and medium-sized and flexible so they can respond more quickly to domestic and international changes.

## **FINDINGS**

The results up to now show that the three most important key textile companies are flexible and can respond more quickly to market changes. In order to deal with the recession, more emphasis placed on 'entrepreneurship', 'innovation', 'exports' and 'modern education'.

The results of the SWOT analysis of the textile industry, helped to better explain its financial data. Companies are small to medium size, with a flexibility on the Greek economic crises, with raw material availability ("Greek cotton"), taking advantage of "made in EU" products.

On the other hand, there is a high cost of money (high bank interest rates), lack of long-term national policy for "Greek cotton" and low investments to replace existing machinery.

Finally, the future depends on the ability of each company to adapt to the new market conditions, domestic and international, by producing specialized and innovative products at competitive prices. Low labour costs are not the solution.

There is a need for a change of philosophy, shifting from the production of cheap products to producing quality and innovative products.

## **RESEARCH LIMITATIONS**

Financial data collected up to now, limit industry suggestions. More companies and financial statements are necessary and will be examined in future research.

## **PRACTICAL IMPLICATIONS**

In the past decades there were more than 300 textile companies in Greece, with 170,000 employees and today, companies do not exceed 170, with 60,000 employees. Research will benefit textile industry and employees in Greece by presenting areas of opportunities and weaknesses and finally propose measures to safeguard their viability.

More specifically, viability and growth of Greek textile companies for the coming years should be based on the following pillars:

- Development and use of innovative technologies
- Human Resources Training
- Vertical production lines allowing for increased specialization of products
- Long-term relationships with partners and end-users
- Dynamic development and investment in the vertically integrated production line
- Effective customized product development structure
- Cost-effective corporate structure and operation
- Focus on Environmental Protection and the sustainable development model.

Above can be a reality, with a business plan for the textile industry that must be based on the following pillars:

- Export development
- More capital and liquidity for companies
- Enhancing competitiveness
- A prerequisite for enhancing competitiveness is the gradual reduction of corporate taxation and the reduction of non-wage costs in order to stimulate employment.

## **ORIGINALITY/VALUE**

The originality of this work, when will be finished, is that will offer new knowledge by evaluating Greek textile companies.

## CASH FLOW MANAGEMENT AS A CRITICAL FACTOR ON BUSINESS EFFICIENCY – STUDY ON PSI 20 COMPANIES

Silva, Eduardo<sup>1</sup>; Pereira, Adalmiro<sup>1</sup>; Vaz, Ângela<sup>2</sup>; Ramos, Elisabete<sup>3</sup>

<sup>1</sup>Management, ISCAP-PPorto, CEOs member, Porto, Portugal

<sup>2</sup>ISCAP-PPorto, Andrade & Brandão, Lda member, Porto, Portugal

<sup>3</sup>ISCAP-PPorto, Porto, Portugal

### ABSTRACT

Nowadays, the economic environment has been demanding from companies a continuous efficiency regarding financial management.

The cash flow statement provides its users with a basis for identifying and assessing the organization's ability to generate and use its financial flows. The financial statements allow you to extract information that reveals your operations during a certain period of time, and when analyzed, they help to form a strong and sustained strategy, allowing you to detect the strong and weak aspects and thus collaborate in decision making.

The analysis of cash flows allows the manager to understand the need, whether or not, to obtain a loan, or apply the surplus cash in profitable operations in order to provide a balanced cash flow (Oliveira, 2017).

**Table 1: financial management concept**

|                      |   |   |
|----------------------|---|---|
| Financial management | In the medium and long term (business strategy)                       | <b>Politics:</b><br>- investments<br>- financing<br>- distribution of results |
|                      | Short-term or broad-based treasury management (operational decisions) | <b>Management:</b><br>-current assets<br>-short-term debt                     |

Source: page 16, Neves, J.C.D (1989). *Análise financeira: métodos e técnicas*. Lisboa: Texto Editora

The role of the financial manager is crucial to the day-to-day life of a company. All decisions made in the short term can truly affect the financial situation of the organization, so it is essential to carry out an effective treasury management (Menezes, 2001).

The budget is a support tool for achieving the defined objectives (Jordan, Neves and Rodrigues (2008). Financial planning is nothing more than a document that is framed in the long-term objectives and, of course, in the organization's mission.

According to Malhotra (2006), in the case of qualitative research, this aims to provide a greater view and understanding of the context of the problem and also explains the results obtained by quantitative research. This is the path we will follow.

Efficient cash flow management is important for business strategy. The research questions that arise are: Does the efficiency of cash flow management allow for its balance? Does the cash flow budget translate into a crucial factor for business efficiency? How does cash flow management translate into a competitive market advantage?

The main objective of this article is to study the PSI 20 companies, analyzing management reports in order to highlight the importance of treasury management and how the demonstration of cash flows in the daily lives of these organizations complement decision making.

The possible limitation is the universe of companies we are going to use and a possible suggestion for future works is compare the situation of Portuguese companies with other countries.

# DETERMINANTS OF INTERPERSONAL TRUST IN VERTICAL AND LATERAL RELATIONSHIPS: DIFFERENCES IN INDIAN MANUFACTURING AND SERVICE ORGANIZATIONS

Singh, Upasana

Institute of Management, JK Lakshmipat University, JKLU, Jaipur, India

## ABSTRACT

This study was conducted in an exploratory framework using survey research to examine the antecedents of Interpersonal trust within manufacturing and service organizations. The data was of 303 employees was studied through regression analysis to identify the determinants of interpersonal trust at workplace. The results linking individual level variables and the dimensions of interpersonal trust provide greater insights into the factors which were important in determining trust in lateral (trust in colleagues) and vertical (trust in supervisor) dyadic relationships. Trust in colleagues was predicted by interaction frequency and consistency in behaviour shown by the colleagues for the sample belonging to manufacturing sector. The results for service sector showed that interaction frequency, consistency in behaviour, and technical competence of colleagues were considered important in determining trusting relationship with the colleagues. Therefore, factors which consistently contributed to the development of trust across different sets of the sample were interaction frequency with colleagues, and behavioural consistency of the colleagues.

Trust in supervisor was determined by competence and consistency in behaviour shown by the supervisor for the overall sample and the service sector. However, findings of manufacturing sector indicated that behavioural consistency was the only factor which influenced trust in supervisor. Therefore, a clear picture which emerged was that behavioural consistency was unanimously considered important apart from other factors, in determining trust in both lateral (colleagues) and vertical (supervisor) dyadic relationships, across overall, manufacturing, and service sectors. The findings provide relevant implications for industries to engender trust for greater organizational performance.

### ABSTRACT

The financial system consists without doubt one of the most important determinants of the world national economies. The changes and challenges that the financial institutions face have a great impact on the economic growth prospects of a country and the configuration of the economic environment of each domestic economy (Chen et al., 2010). A healthy economy needs a stable financial system in order to convey capitals from the surplus economic bodies to the deficits ones in order funds to be invested in the productive process. The structure and the function of the financial sector differentiate from country to country widening the range of various possible forms that financial institutions could have. However, the banking sector within any economy is the major source for economic growth and trustee of financial stability. The banking sector goes at the very heart of the financial system and its influence on national economies is pivotal, because available funds are filtered through it to the economy for investment. The purpose of the current paper is to investigate the extent to which the implementation of International Financial Reporting Standards (IFRS) accompanied by Corporate Governance practices have affected the quality of financial and narrative reporting produced by banks. The study uses a sample of 14 commercial Greek banks and investigates their reports and performance for the period from 2008 to 2011 that includes not only the burst of global financial crisis, but also the start of the Greek sovereign debt crisis.

The purpose of the current research is to examine the extent to which the implementation of International Financial Reporting Standards (IFRS) as well as Corporate Governance practices have affected the financial and narrative reporting in the Greek banking sector. The European Community Regulation No. 1606/2002 required all EU listed companies to prepare their consolidated financial statements in accordance to IFRS as from 1<sup>st</sup> January 2005. The rationale is that the development of global financial markets demands harmonization and standardization of accounting standards (Jermakowicz, 2004); namely, a common language for financial reporting. Besides, one of the objectives for the International Accounting Standards Committee (IASC) after the implementation of

generally accepted accounting standards was the improvement of accounting quality (IASB, 1989). The debate on the requirement to adopt generally accepted principles in reporting has its roots to the importance of the characteristics of individual markets and institutional frameworks to determine accounting standards (Chen et al., 2010). However, advanced quality standards do not necessarily provide high quality reporting and it is the existence of incentives and institutional influences that positively contribute to it (Ball et al., 2003). This study investigates the impact of the IFRS mandatory adoption in a typical code-law European country such as Greece focusing exactly on the period that global financial crisis began. The focus on banks is justified due to the significant role they play to the economy and development and the major impact of IAS39 to their financial reporting. Also, global financial crisis has increased the need for additional measures for quality reporting for the protection of institutions, financial markets and stakeholders. Such measures are grouped into Corporate Governance best practices; thus, we investigate their implications to quality reporting together with IFRS.

The rationale for the study is to make inferences regarding the quality of reporting and whether the IFRS and Corporate Governance practices offered quality information to stakeholders. The originality of the study rest on that it uses the case of Greece for a period that incorporates both the burst of global financial crisis and the beginning of the Greek sovereign debt crisis. Also, the banking sector suffered from severe pressure during this period edue to its interrelationship with the financial and debt crisis. In addition to the above, we explore the influence of IFRS to provide quality information to stakeholders through published reports. Moreover, we test whether corporate governance practices adopted by banks could contribute either alone or in conjunction with the adoption of IFRS to enhancing the quality of information provided through the published statements.

Firstly, we explore the impact of IFRS to the financial statements of the Greek Banking sector. A research of Paglietti (2009) mentioned that, after the implementation of IFRS, Return on Assets (ROA) increased as observed from financial reports and the ROA indicator represents how effectively a business has been using its operating assets. The purpose of the examination of ROA is to observe if there is an impact on the Greek banking sector prior and after the IFRS implementation. Moreover, we include Corporate Governance variables into our analysis. Specifically, we test the number of independent board members, the diversity of the board (male-female members), the performance of audits by an external auditor, the audit committee independence, and the audit committee expertise relative to their impact on quality of reporting and the value as perceived by investors.

We also compare the amount and type of narrative information disclosed in Management Commentary Reports for the period 2008-2011. Management commentary reports were analysed using a question checklist proposed by the International Accounting Standards Board in 2005. The

question checklist (Management Commentary Scoring Sheet) includes 5 categories of analysis; Category 1: the nature of the business, Category 2: objective and strategy, Category 3: key resources, risks and relationships, Category 4: results and prospects and Category 5: performance measures and indicators.

Research results regarding corporate governance variables are consistent with the expectations. We found that *Board Diversity* measured as the number of female and foreign culture representatives to the board was positively associated with the quality of reporting indicating that banks with mixed boards of directors had a propensity to produce reports with increased amount of details regarding their performance. The data also revealed the positive contribution of *Audit Committee Expertise* (measured with the existence of at least 4 financial experts of SOX) and *Audit Committee Independence* (measured as the % of independent audit committee members) with the decision to include information on performance significantly improving the quality of reporting. Moreover, our analysis indicates a positive relationship between the quality of reporting and the performance of *External Audits* by an experienced auditor in the field of CSR/Health and Safety/Sustainability. Contrary to the above, we found that *Independent Board Members* variable was negatively related the quality of reporting in the sense that as the percentage of non-executive board members was increased, the quantity of narratives in reporting was decreased deteriorating the overall reporting quality. On the same grounds, our results indicated an inverse relationship between profitability (measured in terms of ROA) and quality reporting. Specifically, we found that an increase in the profitability of a bank through the years from 2008 to 2011 was negatively related to the quality of reporting produced.

The current project analyses the financial reports of fourteen Greek commercial banks for the period that ranges from 2008 to 2011. This period includes the burst of global financial crisis as well as the beginning of the Greek sovereign debt crisis. The analysis includes the exploitation of the most important financial figures and the investigation of the quality improvement presented into published financial reports. In order to conduct the financial examination, we analyze the consolidated financial, profit and loss and cash flow statements. These statements were derived from Datastream database. The selection criteria of the financial institutions are based on the consistency of its largest and most credible banks operating in the Greek economy, which account for 14 banks.

# THE EFFECTS OF COMPLIANCE WITH INTERNAL CONTROL AND RISK MANAGEMENT SYSTEM PRINCIPLES ON OPERATIONAL PERFORMANCE OF ITALIAN COMPANIES

Tassone, Tonia

University of Calabria, DISCAG, tonia.tasone@unical.it, Rende (CS), Italy

## ABSTRACT

Although the scientific community has widely recognized the importance of the Internal Control and Risk Management System (ICRMS) as an internal corporate governance mechanism useful from different perspectives for the creation of business value, many conclusions are still controversial and different aspects still remain unexplored (Chalmers et al., 2019). Contrary to what is found in the US landscape, where there are numerous theoretical and especially empirical contributions on the positive relationship between the Internal Control System (Over Financial Reporting) and business (operational and financial) performance, in the European context there are still very few studies analysing the economic effects of the ICRMS. Especially the European contributions relating to the particular relationship between ICRMS and business operating performance seems almost non-existent. The European context notoriously characterized by less enforcement of shareholder protection than those studied so far, has been recognized worthy of further study by the scientific community (Chalmers et al., 2019). Furthermore, the different legislative (Deumes and Knechel, 2008; van de Poel and Vanstraelen, 2011) and cultural connotations (Hooghiemstra et al., 2015) assumed by the internal control system in each country, which seem to play a fundamental role, force us to a national based analysis. The aim of the work is to analyse the relationship between the so-called “compliance or explanation” with the best practices recommended by the Corporate Governance Code relating to the ICRMS and the operational performance of Italian listed companies. The Italian context is an excellent representative example of the majority of the countries that make up the overall European panorama as it has typical characteristics, such as the principle based approach and a weak market system in protecting investors. For this purpose, an OLS regression model is implemented considering appropriate robustness control and check variables to reduce possible distortions typically present in problems relating to the relationship between corporate governance and performance. The degree of compliance with the recommendations of the Corporate Governance Code inherent to the ICRMS is broadly understood as “compliance or explanation” (Rose, 2016; Arcot and Bruno, 2006). It is appreciated through a constructed score. The latter provides for the implementation of a content analysis of the annual corporate governance reports of the sampled companies. The validity and reliability of the results of the related coding process are verified by appropriate tests

generally used in this type of analysis (Krippendorff, 2004; Mackey and Gass, 2005). Operational performance is intended as an indicator of management's ability to make optimal choices in managing the business. Consistently with the major literature on the subject, it is measured with ROA. The reference period covers two years (2015 and 2018) in order to capture the changes in governance, albeit relative, subsequent to the main regulatory innovations regarding internal control and risk management. The work is believed to contribute to the national and international debate relating to the relationship between corporate governance and performance, compliance with the Corporate Governance Codes, the economic effects deriving from the application of the ICRMS and the consequences of reporting in scenarios dominated by the voluntary disclosure. We want to check whether the application of these recommendations aims at a substantial improvement in investor protection, an increase in the efficiency and effectiveness of management operations and the safeguarding of corporate assets as supported by the Committee of Sponsoring Organizations of the Treadway Commission (CoSO, 2013). It is also useful for policy makers, practitioners and market agent to verify whether the adoption of the recommendations of the Corporate Governance Code regarding internal controls represents a mere "tick the box" exercise driven by reasons for legitimizing the action of companies on the global market - as typically happens in civil law countries - (Arcot and Bruno, 2006; Zattoni and Cuomo, 2008), or is aimed at concretizing the participation of companies in the sustainable development of the economy.

## A "BIBLIOMETRIX" REVIEW OF MANAGEMENT CONTROL

Tassone, Tonia;Franco, E. Rubino

University of Calabria, DISCAG, Rende (CS), Italy

### ABSTRACT

In recent years, researchers, academics, practitioners, and stakeholders have begun to question the causes of the gap between theory and practice in Management Control field due to the misalignments between the innovations brought by academics (Johnson and Kaplan, 1987) and the changing in the control needs that made management control's tools obsolete (Nixon and Burns, 2005). The need of new frameworks more adherent to current conditions has become pressing (Otley, Broadbent and Berry, 1995; Langfield-smith, 1997; Nixon and Burns, 2005; Malmi and Brown, 2008; van Helden and Reichard, 2019;Chenhall, 2003). Therefore, the huge proliferation of theoretical contributions carried to an overwhelming mole of theoretical conceptualisations that has led the management control literature to trickle through further different control-related fields (Anthony; 1965; Lowe, 1971; Ouchi, 1979; Flamholtz, 1979; Otley and Berry, 1980; Daft and Macintosh, 1984; Abernethy and Chua, 1996; Otley, 1999; Chenhall, 2003; Merchant and Van der Stede, 2007; Malmi and Brown, 2008; Ferreira and Otley 2005, 2009; Strauß and Zecher, 2013) and to lose comprehensive homogeneity and coherence. According to Ramos-Rodríguez & Ruíz-Navarro (2004), "Once a scientific discipline has reached a certain degree of maturity, it is common practice for its scholars to turn their attention towards the literature generated by the scientific community and, treating it as a research topic in its own right, to conduct reviews of the literature with a view to assessing the general state of the art". On this premises, our purpose is to provide both an overview and detailed key findings in the management control's research. This could shed light on aspects related to the current fragmented literature and lead researchers to appreciating what has be done so far and what has to be done, taking their own reasonable conclusions. This work aims to contribute to research on Management Control by carrying out a bibliometric analysis of the extant Management control literature through common science mapping techniques. It provides a descriptive analysis of the relevant contributions and results of a science mapping study on the conceptual, intellectual and social structure of the Management Control knowledge. Thus, conceptualizations, sources of knowledge, and community networks are considered basic. Conceptual, intellectual, and social interrelationships have been intercepted, so that a reconstruction of the management control debates in terms of academic research production has been coped with. A further theoretical contribution has been given by the identification of the main themes orbiting this field. So that it is possible to obtain information about the impact that the Management Control research has had outside the specific research field panorama or consolidated communities.

Hence, bibliometric techniques have been implemented, by using a package in the R environment. In order to perform our bibliometric analysis, we apply a standard science mapping workflow (Zupic and Cater, 2015; Cobo et al., 2011, 2014; Aria and Cuccurullo, 2017). The analysis follows a protocol that not only makes the process traceable (Liberati et al., 2009) and verifiable, but minimizes probable distortions (Tranfield, Denyer and Smart, 2003; Schmeisser, 2013; Durach, Kembro and Wieland, 2017). Analysis object is characterized by a sample of papers extracted from Scopus. In order to ensure a high quality level of research, the extraction criterions include the exclusive inclusion of the main journals indexed according to the Academic Journal Guide 2018 published by the Chartered Association of Business School.

# VALUE CREATION WITH PROJECT RISK MANAGEMENT: A SYSTEMATIC LITERATURE REVIEW

Testorelli, Raffaele; Verbano, Chiara

Dept. Management and Engineering, University of Padova, Vicenza, Italy

## ABSTRACT

## INTRODUCTION

Project Risk Management (PRM) is a systematic process that aims to identify and manage risk, implementing systems and procedures to identify, analyse, evaluate and address risks inherent in any project (Raz and Michael, 2001). PRM is one of the major approaches implemented by companies to achieve success in their projects (Elkington and Smallman, 2002). In recent years PRM is increasingly seen as a value creation process for companies. Indeed, recent directions of ISO 31000: Risk Management and COSO framework (Committee of Sponsoring Organizations of the Treadway Commission) are giving greater relevance to value creation and protection, changing the traditional focus on adversity and extending the view also to potential positive effects of risks (ISO 31000, 2018; COSO, 2017). Within these standards, there is a basic and underlying assumption that PRM creates value; however, both standards remain silent concerning any definition or explanation of this *value* (de Pooter, 2019). Extending the view to the empirical literature on PRM, it can be noticed that value created with PRM is often associated to project outputs and outcomes, increased probability of project success and other strategic and organizational benefits, and value creation is often related to PRM best-practices. Nevertheless, empirical results range between extreme opposites, showing significant discrepancies, even when results are compared with standards and normative best-practices (Willumsen *et al.*, 2019). The purpose of the study is to foster PRM knowledge and to support companies to enhance value capturing from their own projects and the whole organization, in relations to benefits generated through PRM, when compared with the costs of its implementation (what is value), to project stakeholders' perceptions and expectations (to whom is valuable), and to which contextual factors affect value creation and capture (where/when value is captured).

## METHODOLOGY

In order to perform both a descriptive and a content analysis about value creation through PRM, a systematic literature review has been performed and accomplished based on the guidelines proposed by Macpherson and Holt (2007) and Tranfield, Denyer and Smart (2003), adapted to this specific

research, between November 2019 and February 2020. A database (DB) containing the works available in the literature on the topic has been created, evaluating the quality of publications, in order to obtain a value result. To build the DB, the two most widespread databases for searching the literature were used: *Scopus of Elsevier* and *Web of Science Core Collection (WoS)* by *Clarivate Analytics* (Guz and Rushchitsky, 2009). Different sets of keywords were used, combining the terms “*Project Risk Management*”, “*Project Management*”, “*Value Creation*”, “*Value Management*”, “*Benefits*” and “*Performance*”, filtering on time period (years from 2004 to 2020), document type (only journal articles and reviews), language (only papers in English), and relevant categories related to Management, Engineering, Business and Economics fields. To narrow down the results, a selection process was performed using the following filters: exclusion of journals not classified in Q1, Q2 or Q3 quartiles by *WoS* and journals not classified in Q1 or Q2 quartiles by *Scopus*, and exclusion of duplicated articles among the results of the queries and between the two databases. At this point, 254 articles were obtained, but they needed to be analysed more carefully. To do so, the abstract and further the full text of the papers were read, excluding those not related to value creation with PRM and/or not applying a scientific approach; the final DB contains 65 papers. The descriptive analysis performed showed that there has been a growing interest on the theme, and that 61 authors from 26 different countries have contributed to the topic in the last 15 years, particularly from UK (18%), USA (8%), Australia (8%), Finland (8%). The more considered sectors are those where companies are traditionally project-oriented, in particular Construction (30%), ICT (12%), Energy & Engineering (7%), Manufacturing (7%) and Professional Services (7%). The most engaged journals are *International Journal of Project Management* (35%) and the *International Journal of Managing Projects in Business* (17%). Following the descriptive analysis, the content analysis was performed considering: a) level of analysis (who/what creates value and to whom, at customer level, company level, project level, ecosystem level and society level), b) content perspective (what is value), c) process perspective (how value is created and captured), d) contextual factors (which factors affect value creation and capture), e) stakeholders perspective (what is valuable to stakeholders), and f) value measurement (how value could be measured). These analyses have allowed identifying the relevant factors that must be taken into consideration for the subsequent development of the research, the gaps in the literature and the potential future developments.

## RESULTS AND CONTRIBUTIONS

Analysing PRM literature through the lens of value creation, it emerges that value content is often associated to project’s outputs and outcomes, and to other strategic and organizational benefits, while the value creation process is related to PRM best-practices (Willumsen *et al.*, 2019). The findings suggest

that the conflicting results on PRM value creation are due to different and interlinked reasons. First, there is not a consensus among researchers on how to define and measure value created with PRM (Lee, Tommelein and Ballard, 2013; Mir and Pinnington, 2014; de Carvalho and Rabechini Junior, 2015; Serra and Kunc, 2015; Furlong *et al.*, 2017; Hjelmbrekke, Klakegg and Lohne, 2017; Perrenoud *et al.*, 2017; Santos, Gaspar and Schiozer, 2017; Choi *et al.*, 2019; Willumsen *et al.*, 2019; Green and Sergeeva, 2019; Laursen and Killen, 2019). Furthermore, considering the complexity of projects, it is not easy to proof to what extent PRM has influenced the manifestation of uncertainty, and if there are also other compounding or contextual factors (Besner and Hobbs, 2012; de Carvalho and Rabechini Junior, 2015; Willumsen *et al.*, 2019). In addition, stakeholders have conflicting interests and subjective perceptions, thus they cannot truly consider the value and appropriateness of a result without understanding its relevance in a specific context (Lepak, Smith and Taylor, 2007; Martinsuo and Hoverfält, 2018; Smyth, Lecoivre and Vaesken, 2018; Green and Sergeeva, 2019; Laursen and Killen, 2019). Finally, repeatability is a critical factor, considering that each project has its unique characteristics and it is difficult to reproduce. Moreover, value created with PRM has many dimensions, even beyond the conventional economic perspective, including intangible elements. Indeed, value created impacts customer satisfaction and trust (Neap and Aysal, 2004; Winter and Szczepanek, 2008; Voss, 2012; Zaveckaite and Ulbinaite, 2018; Chih, Zwikael and Restubog, 2019; Choi *et al.*, 2019; Fuentes, Smyth and Davies, 2019), enhance quality of strategic evaluations (Sanchez *et al.*, 2009; Rohaninejad and Bagherpour, 2013; Mir and Pinnington, 2014; de Carvalho and Rabechini Junior, 2015; Hjelmbrekke, Klakegg and Lohne, 2017), improve decision-making (Ellis, Wood and Keel, 2005; Hwang, Zhao and Toh, 2014; Furlong *et al.*, 2017; Santos, Gaspar and Schiozer, 2017; Shojaei and Haeri, 2019), and enables other management processes within the organization, that in turn influence project's outcomes creating indirectly additional value (Wang, Lin and Huang, 2010; Andersen, 2016; Javani and Rwelamila, 2016; Zou, Kiviniemi and Jones, 2016; Chen *et al.*, 2019; Willumsen *et al.*, 2019). Finally, the time dimension is also relevant, considering that value creation process produces its effects even beyond project's time horizon (Chang *et al.*, 2013; Badewi, 2016; Smyth, Lecoivre and Vaesken, 2018). This work has the goal to define a framework for PRM value measurement, in order to compare both economic and intangible benefits with costs of its implementation, and to validate it through multiple case studies. This work will give guidance to managers on how to maximize value capturing from their projects and the whole organization, contributing to foster PRM knowledge and providing indications to researchers about future directions

### ABSTRACT

Nowadays companies allow employees to work autonomously and flexible (Smith et al., 2018), which is supported by enabling information and communication technology, so employees can work from nearly everywhere they want to (Kingma, 2016). Moreover, recent studies show that 67.4 percent of employees request to have this opportunity, but only 43.4 percent of the companies provide it (Weitzel et al., 2019). This is in line with the statement of Rubery et al. (2016) pointing out that conditions of work are becoming increasingly more flexible.

Following the innovative research stream of Nordbäck et al. (2017), Whyman and Petrescu (2015) and Mesu et al. (2012), the aim of this research is to investigate and explain the nature of relationships between leadership, trust, performance and internal numerical flexibility. In addition, this research intends to cover the existing research gap as to the level of workplace flexibility practices in SMEs (Kotey, 2011) which is currently still under-explored (Whyman and Petrescu, 2015). Therefore, the general research question is: How do leadership and trust affect internal numerical flexibility? To answer this question, initially an exploratory qualitative research design will be set up. CEOs and/or CHROs will be interviewed through semi-structured expert interviews. The new insights will be used for the validation of an existing initial conceptual framework, derived from a literature review. This study on a strategic human resource management topic will be conducted mainly in German SMEs, as 99.5 percent of German companies are SMEs (Eurostat, 2020), but enhanced by participants from larger companies since these often include professional human resource management (Lepak and Snell, 2002). There will be so many interviews until a theoretical saturation is reached (Charmaz, 2006). No comparable qualitative study was found what underlines the originality and value of this research.

It is expected that relevant insights on the theoretical perspective will be uncovered, e.g. on the nexus between information and communication technology, leadership as well as internal numerical flexibility. Moreover, managerial findings – like how trust among remote-working employees affects them – are anticipated due to the fact that semi-structured interviews will be conducted with managers of companies.

<sup>2</sup>Azienda ULSS 2 Marca Trevigiana, Treviso, Italy

## ABSTRACT

## INTRODUCTION

The healthcare service faces sustainability issues over time, managing ageing population and growing quality care expectation, despite heavy restrictions on budgets (Dickson et al., 2009;). With the aim of satisfying the customer demand, balancing safe, reliable and affordable care with efficiency, Lean Management (LM), a methodology derived from Toyota Production System, has been increasingly adopted in many healthcare organizations, to improve the value delivered to the patient by reducing waste and inefficiencies (Radnor et al., 2012). Emergency Department (ED) revealed to be one of the most critical area, with overcrowding, process delays, high costs and patient dissatisfaction as major concerns (Bucci et al., 2016). In this regard, lean healthcare management seeks to increase ED performances, focusing on patient flow and eliminating nonvalue-added activities, with no additional resources (Holden, 2011). Literature reports a wide evidence of LM adoption in ED (Hallam and Contreras, 2018), as the pioneer department, documenting positive effects on process capacity, reactivity and efficiency, on turnaround times and length of stay, on care quality and patient safety (Mousavi Isfahani et al., 2019). Although LM in EDs has demonstrated its potential on improving healthcare management, further studies are needed to assess its effects on performance and on patient care (Borges et al., 2019; Ramori et al., 2019). In particular, there is limited empirical research evaluating how a manufacturing methodology has been adapted to the healthcare sector (Hallam and Contreras, 2018). For this reason, this study aims to analyze how LM projects have been developed in EDs, investigating the pursued objectives, the adopted tools, the performed tasks, the systematically achieved improvements and the key factors required for a successful implementation.

## METHODOLOGY

In order to pursue the research objective, a systematic literature review has been conducted following the PRISMA Statement (Liberati et al., 2009). A bibliographic searching in Scopus, Pubmed and Web of Science databases allowed to identify 452 articles referred to the different combinations of the following keywords: "lean management", "lean thinking", "lean healthcare", "kaizen", "patient

flow", "lean methodology", "lean tools", "lean techniques", associated with the Boolean operator AND to "(emergency department OR emergency room)". According to the inclusion criteria, only papers written in English language, classified as articles or reviews and coherent with subject area filter were selected for further examinations. After the exclusion of duplications, 149 articles were submitted to a title and abstract analysis, in order to preliminarily evaluate their consistency to the investigation question, eliminating 81 documents not referring to ED as the application context or to LM as the main managerial technique adopted. Finally, the full-text articles accessed for eligibility were reviewed in relations to their relevance and to their compliance to case study methodology inclusion criteria, excluding literature reviews, theoretical papers and articles developed in less than 3 pages. The remaining publications were screened according to the following inclusion criteria: firstly, the adequacy of project setting, eliminating papers focused on specific departments or clinical pathways, without considering the global effects on ED performances; secondly, the adoption of a structured approach in implementing LM, with a developed methodology comprehensive of an adequate description of the followed tasks and a proper tools application; lastly, the objectives coherence between literature research and the case study analyzed. Finally, 28 papers have been retained for the final database. A descriptive and content analysis have been conducted on the extracted database.

## RESULTS

The descriptive analysis highlighted the growing diffusion of LM in EDs in the last five years, especially in USA, Italy, UK and Lebanon, underlining the novelty of the phenomenon. The quality of the database was assessed through the Scimago Journal Rank (SJR), revealing that the 87% of the journal papers were published in Q1 and Q2 journals. The theme was studied in medical (79%) and in engineering (13%) journals, confirming the interest of both scientific communities in its future potential development. The content analysis was performed investigating the projects developed to implement LM in ED. It focused on the motivations underlying the adoption of LM in ED, the pursued objectives, the followed methodology (organizational and managerial aspects) to set and achieve the project objectives, the applied LM tools, the obtained quantitative results and the key success factors. The literature review showed how overcrowding, inefficiency, low quality care, unsatisfied patients and high costs represent the most critical aspects afflicting ED performances. These critical issues pull the system towards an engineering reorganization process, driven by the aim of improving patient flow, efficiency and safety, reducing waiting times and wastes, to better manage patient volume and access block. Although the experiences heterogeneity highlighted the lack of a standardized methodology to adopt LM in ED, the analyzed literature provided an evidence of the

relevance of a systematic approach, developed, in most cases, in a first phase of in-depth preliminary planning, team creation and goal definition, in a thorough process mapping phase that leads to the individuation of the root causes and the improvement ideas, in implementation tasks and finally in standardization, maintenance and monitoring activities. Many authors focused on the importance of properly applying the LM techniques in each context, adapting a structured methodology to the specific needs and goals, and choosing the most suitable tools according to the stage of the project life cycle. In this regard, the authors showed the large variety of LM tools, where Value Stream Map constituted the most used, followed by kaizen event, root cause analysis and visual management techniques, while tools frequently employed in manufacturing industry, as kanban and heijunka, are still underexploited in healthcare. The literature review illustrated how the growing diffusion of LM adoption in ED is supported by successful results concerning efficiency, productivity and quality of the service, in addition to a reduction of costs and needed resources. The totality of case studies demonstrated improvements on decreased length of stay and waiting times throughout the process, on increased patient volume and on patients and employees overall satisfaction.

The current analysis allowed to identify the key factors that enable the success of a LM project:

- The importance of creating multidisciplinary project teams, trained on LM principles and skilled in problem solving (Verbano and Crema, 2019), to empower the ED frontline staff in an active participation to the improvement process (Kane et al., 2015) and to include all the stakeholders involved (Hitti et al., 2017);
- The value of good and effective communication to share real-time information and make the system reactive to changes (Arbune et al., 2017);
- The essential role of leadership support to create and spread the LM philosophy among employees, acting as a role model in the paradigm shift towards a continuous improvement long-term view (Cookson et al., 2011; Vashi et al., 2019);
- The structuring of improvement projects in specified tasks, and in small and simple changes, effectively developable by ED employees (Arbune et al., 2017);
- Adoption of an holistic approach in implementing LM to take into consideration the effects related to the improvement project on the entire value stream (Elamir, 2018).

The adoption of LM in ED is still in its early stage, showing the lack of a standardized project development and of a shared methodology to apply techniques and tools. This paper provides a contribution from an academic point of view by presenting an overview, missing in the current literature, on how to structure a LM project in ED, with the purpose of identifying a standardized framework for implementation in healthcare. From a managerial perspective, the analysis of the published case studies allows to identify the best managerial practices and guidelines to support

healthcare managers in developing successful LM projects. The latter should be performed adopting an improvement approach founded on employee involvement, on creation of solid processes and on introduction of small cycles of changes. Based on the guidelines developed thanks to this study, other research could be performed applying the framework for developing projects in healthcare and comparing its implementation in diverse settings. Moreover, other research should be conducted in the future, for example in order to investigate statistical correlation between LM and the obtained results, but also to diffuse a system culture oriented towards kaizen. The complexity of the ED service opens up to emerging challenges that could be managed and solved through the adoption of new organizational and managerial approaches, improving the management of healthcare and the satisfaction of internal personnel and of the community in general.

### ABSTRACT

Since the rise of Open Innovation (OI hereafter) paradigm (Chesbrough, 2003), many scholars have investigated its effects on company performance or strategies (e.g. Lichtenthaler, 2009; Parida et al., 2012; Hung and Chou, 2013; Yun et al., 2018).

The landscape for entrepreneurial initiatives has changed over the last years, and a growing number of Open Innovation Platforms (OIPs hereafter) entered the global arena as significant tools to help companies in leveraging new knowledge from the people (West and Bogers, 2014; De Falco et al., 2017).

In recent years, several scholars have approached OIPs in order to explore their dynamics, and most of them focused on knowledge-based practices, platforms services and motivations of collaboration between participants (Frey et al., 2011; Kathan et al., 2014; Battistella and Nonino, 2012, 2013; De Falco et al., 2017; Randhawa et al., 2017; De Silva et al., 2018; Matricano et al., 2019).

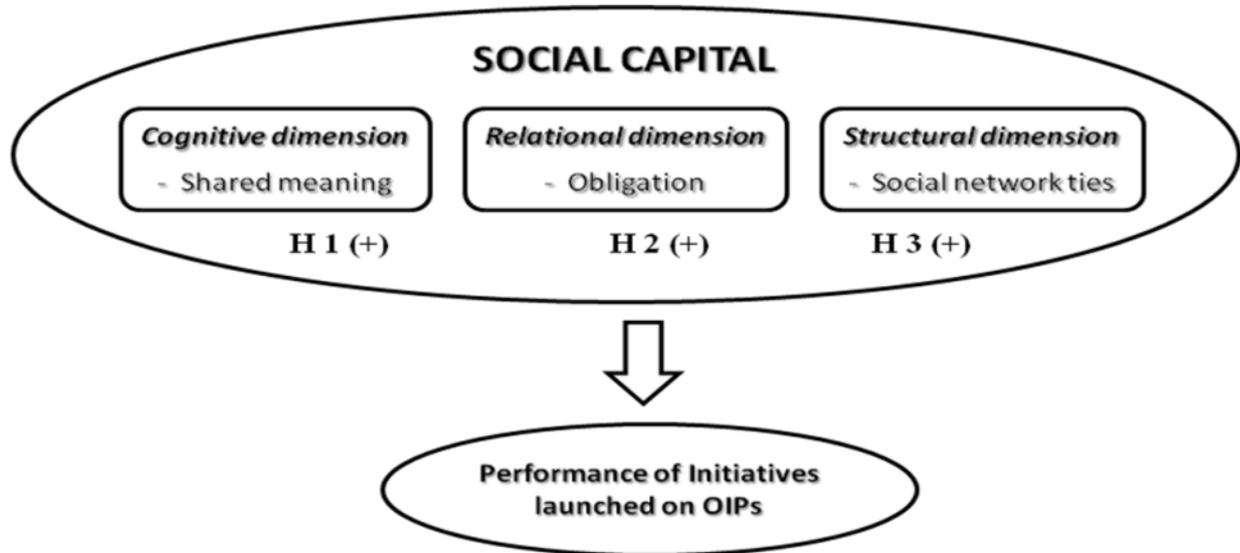

OIPs are a typical example of "two-sided platforms" as they connect two groups of users and operate as intermediaries (Belleflamme and Peitz, 2018). Two types of users populate the virtual OIPs on the demand side and the supply side (Troise et al., 2020): innovation seekers (the proponents of initiatives who launch online challenges) and backers (the innovators or problem solvers who support the initiatives and contribute to solve a challenge by sending their ideas).

Despite the spread of OIPs and the growing interest by scholars and practitioners, only few studies have explored the successful drivers that lead initiatives to get superior performance through the online challenge (Troise et al., 2020). In this specific emerging research stream, little is known about the role of social capital in the success of these initiatives within OIPs.

The aim of this study is to fill this gap by investigating the role of social capital in the success of online challenges within OIPs. Since social capital is a multidimensional concept, we consider the effects of its three main dimensions: cognitive, relational and structural (Nahapiet and Ghoshal, 1998; Liu et al., 2010; Zheng et al., 2014). In line with the prior study of Zheng et al. (2014) who analyzed these three dimensions in the context of reward-crowdfunding platforms, we consider: shared meaning (i.e. the length of the description of initiatives posted on the OIP) as an expression of the cognitive dimension; obligation (i.e. the number of others' initiatives who the proponents of the challenge supported before

the launch of their own initiative) as an expression of the relational dimension; social network ties (i.e. the number of proponents' friends on their main social networks, e.g. Facebook and LinkedIn) as an expression of the structural dimension. Based on the above, we propose the following theoretical framework (Figure 1) in order to explore the effects of social capital on the performance of online initiatives launched on OIPs.

Figure 1. Theoretical Framework

We propose that social capital – i.e. cognitive dimension (H1), relational dimension (H2) and structural dimension (H3) – positively influences the performance of the initiatives launched on OIPs. Following the prior study of Troise et al. (2020), we consider two main parameters as proxies of initiatives' success: the number of ideas submitted at the end of the online call and the number of final backers involved.

This research is a work in progress. We are collecting data from four main well-known OIPs (since their origin up to 2019): Opeindeo, Openinnovation-suedtirol, Guerra-creativa and Crowdspring. At the end of the data-collection we will have about 600 initiatives as final sample. In order to test the impact of social capital on initiatives' performance we will run two regression models (negative binomial or zero-inflated negative binomial regression as the two dependent variables are count parameters) in order to capture its effects on the final number of ideas (Model 1) and the number of backers (Model 2). We expect a positive impact of the three factors on both the initiatives' outcomes.

The results of this research will add new knowledge in a nascent research stream and – hopefully – will have both theoretical and practical implications for several stakeholders, in particular innovation seekers (especially companies and entrepreneurs), backers, platform managers and policy makers.

# DETERMINING FACTORS AFFECTING THE CHOICE OF SUSTAINABLE FISH PRODUCTS: AN EMPIRICAL INVESTIGATION IN THE ITALIAN AND SPANISH MARKET

Tulone, Antonio<sup>1</sup>; Miret Pastor, Luis Gaspar<sup>2</sup>; Crescimanno, Maria<sup>1</sup>; Siggia, Dario<sup>3</sup>; Giacomarra, Marcella<sup>1</sup>; Galati Antonino<sup>1</sup>

## ABSTRACT

## INTRODUCTION

In recent decades, the fish stocks have been increasingly depleted, due mainly to the overfishing and illegal fishing. The perception of excessive fishing capacity led in the early 2000s to a review of the Common Fisheries Policy and the approval of regulations aimed at recovering depleted fish stocks and achieving greater sustainability in the sector. At the same time, the environmental awareness of consumers has grown, resulting in a greater attention towards sustainable products. Despite the new trend in consumption, few scholars have so far focused on consumer habits of sustainable fish products (Kirby and Ward, 2014; Asche *et al.*, 2015; Asche and Bronnmann, 2017). To fill this gap, the aim of this study is to explore the main factors affecting the intention of consumers to choose sustainable fish products.

## METHODOLOGY

To achieve this purpose, a questionnaire was developed based on previous empirical studies on this topic (Grunert *et al.*, 2011; Panda *et al.*, 2020; Kiluchi-Uehara *et al.*, 2016) and conveyed through the main social networks. The survey was carried out in Italy and Spain, two of the most important EU fish producers countries (EUMOFA, 2020), during the period January-February 2020. At the end of the survey, we obtained 324 complete questionnaires, with reference to the Italian market, and 289 for the Spanish one. The data obtained concerned information on the frequency of fish consumption, quality attributes of the purchased products, the values and beliefs of consumers, as well as their socio-economic characteristics. Then, we performed two Probit regression models, respectively for the Italian and Spanish samples, in order to identify the main factors affecting the intention of consumers to choose sustainable fish products.

## RESULTS

Results reveal a greater willingness of Italian consumers (82.1% of the respondents) to choose sustainable fish products, than Spanish consumers (69.2%). Furthermore, the research suggests that those who claim to have strong values of environmental protection and those who are sensitive to altruistic values are more likely to choose seafood produced in a sustainable way. Similarly, the importance associated to the presence of eco-labels on purchased fish products affects positively the intention of consumers to make seafood choices more sustainable. With reference to the socio-economic variables, younger consumers show a greater probability to choose sustainable fish products.

## CONCLUSIONS

The paper presents interesting evidence on the intention of the consumers to commit themselves to make seafood choices more sustainable, showing the main factors affecting this behaviour. Furthermore, the results of the study provide practical implications. On the one hand, the work suggests new insights for entrepreneurs and fish industry operators to define their marketing plans based on the characteristics of consumers. On the other hand, findings provide to policy makers hints for defining awareness campaigns among the population, aimed to increase sustainable purchasing choices by consumers. Despite this, the research is not without limitations, due to the online sampling method, which does not provide a representative sample of the investigated populations. For this reason, future research could extend the investigation to a wider audience and other European countries.

## INTEGRATED SUPPLIER-BUYER INVENTORY MODEL WITH IMPRECISE AMOUNT OF DEFECTIVE ITEMS

Tütüncü, G. Yazgı; Yuce, Gizem

Department of Mathematics, Izmir University of Economics, Izmir, Turkey

### ABSTRACT

In this study, we developed a model to determine an integrated supplier-buyer inventory policy for a single product with defective items, stochastic rework rate and partial backorders. The production process is not perfect and produces a certain amount of defective items with constant rate, while only random proportion of them can be reworkable. There is investment to improve the production process quality and reduce the amount of defective items on the supplier's side. Even though supplier prepares all items in perfect quality at the end of its process, buyer may receive imperfect items due to mishandling, transportation error etc. Demand at buyer's side is stochastic which follows normal distribution. The objective is to minimize the total joint annual costs incurred by the supplier and the buyer. We find the optimal order quantity and reorder point from the expected total annual integrated cost. With numerical examples, it is clear that the integrated model provides a reduced cost in comparison to an independent decision by the buyer. Moreover, the investment from the supplier helps minimizing the joint expected annual total cost.

## ABSTRACT

In addition to the celebrations of the Pankhurst Trust 2018 Centenary Events when Some Women achieved the vote – and, a year that drew attention to the need to continue to ensure women are equally represented in positions of power in the workplace as demonstrated by the *#me too* social movement and a year when the Social Mobility Commission demonstrated the slowing down of social mobility. By March 2018 the publication of the Gender Pay Gap certainly confirmed the need for more action to be taken. The coaching project was an initiative launched by a group of women under the auspices of the Pankhurst Trust who particularly recognised the undervalued skills of women in civic society and also jobs in the hospitality and retail sector. We were keen to offer an alternative to the corporate websites with coaching courses that might not been seen as relevant to the target group. Talking with a variety of senior women in both the private but mainly public sector we found a great deal of support for the idea of a different sort of coaching service and target group and offers to volunteer for any such initiative.

Much has been written about the need for diversity, equity and inclusion in the workplace (Bond and Pyle, 1998; Kelly and Dobbin, 1998; Liff and Wajcman, 1996). A recent survey by Price Waterhouse Coopers highlighted that over 80 percent of CEOs are focussed on promoting diversity and inclusion in their organizations. Coaching initiatives are a vital component for establishing a successful workplace diversity and inclusion programs. Moreover, companies with greater gender and cultural diversity have shown an overall increase in their revenues (Hunt et al, 2018). Still, we find that that the majority of organizations who provide coaching have only paid lip-service to the needs of their employees in terms of their personal and career development (Feldman and Lankau, 2005; Kampa-Kokesch and Anderson, 2001; Mackie, 2007). The majority of women including minorities remain under-represented in many occupations, most notably in high level positions (Hunt et al, 2018). Research has shown that coaching is a vital not only for professional development but to also improve self-confidence, build networks and provide a balance between work and home life (Coffey et al, 1999; Ruderman and Ohlott, 2002) (Birkeland et al, 1997; Peterson, 1993). However, there is little

research that examines how and why coaching works (Ely et al. 2010; Feldman and Lankau, 2005; De Meuse et al, 2009), especially for women who lack access to these resources. Moreover, the coaching literature is insufficient on diversity in terms of research. This may be related to the fact that the coaching literature itself is relatively sparse with adhoc studies (Spence and Oades 2011).

To respond to the lack of research in evaluation of coaching programs for leadership development for women (Kauffman and Coutu 2009, Grant and Cavanagh 2007), this paper presents a coaching evaluation that includes both a summative and formative evaluation (Beyer, 1995; Brown and Gerhardt, 2002; Patton, 1994) of the client, coach, client-coach relationship and the coaching process, as well as summative evaluations of the coaching program. The overall aim of this research was driven by the recognition that women across various sectors do not have access to coaching or a leadership related network whether because of their socio economic and cultural background or the type of workplace/civic role they undertake. The purpose of this paper is to evaluate the effectiveness of a coaching program for women from various organizational backgrounds, with the aim of highlighting the significance of coaching as a powerful tool for diversity, equity and inclusion amongst women in their workplaces. We believe that the role of coaching can help better support the holistic well-being of women from diverse backgrounds and help us understand the full range of factors that underlie women's decision to accept promotion or not as well providing valuable insights into the dynamics at play within their workplaces. It can also help better support the overall well-being and health of both coaches and coachees. Our report shows the findings of an evaluation of the process of designing and delivering the first phase of the service and to move to evaluate the impact. This research builds on an emerging evidence base (Friedman et al, 2017; Hunt et al, 2018; see Social Mobility commission Report- 2018-19) that demonstrates that women fail to reach their potential in both public/community and corporate life, particularly those from working class and diverse backgrounds who have little or no access to a leadership related network. Interviews and data collected from our sample of women revealed that coaching is the key in helping them to make conscious choices and become more inclusive and take actions to make their organizations more equitable. Moreover, Our, initial evaluation of the coaching program has highlighted that coaching is a key activity in the management development, talent management and performance improvement of women leaders across the Greater Manchester area (Pankhurst, 2019).

## MANAGING COMMUNICATION IN INTEGRITY BASED CRISIS: DEALING WITH STAKEHOLDERS PERCEPTIONS

Usero, Belén<sup>1</sup>; Hernández, Virginia<sup>1</sup>; Ramirez, Julianna Paola<sup>2</sup>

<sup>2</sup>CENTRUM Católica Graduate Business School, Lima, Peru

### ABSTRACT

Firms are exposed to several situations that can end in a communication crisis damaging its trust and reputation (Coombs and Holladay, 2002; Coombs, 2015). Regarding this issue, a plethora of studies has examined the way of minimizing the impact of these negative events by using a communication strategy. Particularly, communication crisis involving an integrity-based trust violation may be especially critical for organizations as they may erode corporate reputation and customer loyalty due to an unethical or immoral decisions. In this regard, several studies have examined these types of crises derived from decisions taken by top managers. Some recent examples are the cases of globalized firms such as Volkswagen due to the diesel emissions software cheat technology (Painter and Martins, 2017) or Nike due to illegal hiring practices (McHale et al., 2007). However, the examination of micro-crisis derived from unethical or immoral behaviors from other workers are less usual, despite these crisis are gaining relevance due to the availability of more information about negative events in social media networks (Cheng, 2018; Snoeijers et al., 2014). Previous studies show that organizations often fail to successfully manage integrity-based trust violations because they do not take into account different stakeholders' perceptions. Precisely, in this study, we aim to cover this gap and examine an integrity based crisis situation derived from employees' unethical behavior in a specific event with an important diffusion in social media.

Additionally, we adopt a stakeholder approach in order to examine if managers prepare their responses for an integrity based crisis situation by considering different stakeholders' specific necessities. Then, we analyze if different responses are driven to different stakeholders and which motivations are behind their decisions. Traditionally, literature has focused on specific responses, such as apology-oriented responses (Bentley, 2018), and/or specific stakeholders, such as customers (Dutta and Pullig, 2011). In this research, however, we analyze both different responses in terms of apology, compensation and corrections, as well as different stakeholders involved in the crisis communication, i.e. employees, clients and other individuals from the community.

We base our research on the Situational Crisis Communication Theory (SCCT) which defines different action models regarding the kind of crisis to be managed (Coombs and Holladay, 2002; Coombs, 2014), together with the stakeholder theory (Bentley, 2018). Specifically, we focus on a crisis situation in which

company's trust is affected and how it should be restored via different actions: apology, corrective and compensatory responses (Coombs, 2006). Additionally, we explore how these responses are perceived by different stakeholders taking into account their interests and how the crisis affect each of them (Xu and Li, 2013).

To develop the analysis, we examine a case study from a bank company in Peru which suffered a crisis communication from an unethical behavior from some employees in a sponsorship campaign linked to the classifications for the 2018 FIFA World Cup. The findings indicate that the most effective way to rebuild trust and re-establish legitimacy with key stakeholders is for managers to adopt strategies that include apology, corrective and compensatory actions. The results reveal that stakeholders react in different ways to the crisis response actions adopted by organizations. Apology actions, for example, are perceived more favorably by internal stakeholders than by external stakeholders, while compensatory actions are perceived most positively by external stakeholders. Unexpectedly, corrective responses—in which employees who behave unethically are fired—are seen in the least positive light by all stakeholders. In general, external stakeholders (especially non-clients) have a more critical opinion of crisis communication management than do internal stakeholders. The study highlights the theoretical and practical implications of these findings for scholars and practitioners.

### ABSTRACT

### THEORETICAL BACKGROUND

A key global trend in public sector organizations is to adopt innovative tools which improve the quality of public services, deliver services faster and less expensively, yet more effectively (Arundel, Bloch, & Ferguson, 2019; Bertot, Estevez, & Janowski, 2016; De Vries, Bekkers, & Tummers, 2016). In the current era of 'Digital Government' most developed countries embrace emerging technologies which help them move toward a more digital framework and implement public services innovation at all levels, national, state and local (Bason, 2018; OECD, 2017). As public organizations routinely innovate, it is of paramount importance to ensure that managers and their subordinates fully subscribe to a belief in their own efficacy to implement innovation successfully specifically, and about the indispensability of innovation in general (Altuwaijria & Khorsheed, 2012; Chung & Choi, 2018; Chung, Choi, & Du, 2017). Despite its importance, thus far we know little about the factors fostering public servants' belief in their own efficacy and collective efficacy to implement an adopted innovation. The literature on the topic of innovation implementation, especially in public management (Choi & Chang, 2009; Kim & Chung, 2017; Piening, 2011) treats it largely as a 'black box' (Piening, 2011). This study attempts to respond to this lacuna by examining the key question *-what are the antecedents which amplify public managers' collective implementation efficacy?*

Public administration is a useful target for innovation studies because these organizations provide the framework for the ways public services are provided (Arundel et al., 2019). However, in the context of the public sector, researchers need to pay special attention when studying innovation, since its distinctive characteristics (including rigid hierarchical structure and aversion to risk,) may inhibit employees from experimenting with innovative ideas (Park & Jo, 2018). Managing innovation under these circumstances could be much more challenging compared to the business sector, especially since delivering innovative service is a relatively new goal in some of the OECD countries. In this respect, public managers may view innovation as a source of organizational change, growth, and effectiveness (Damanpour & Schneider, 2009), and therefore may serve as a driving force to overcome part of the restrictions listed above. The overwhelming scholarly consensus maintains that

frontline managers are key to facilitating service innovation (Borins, 2014; Gallup Organization, 2011; Schaarschmidt, 2016). Despite this consensus, however, only limited attention has been paid to explaining innovation from managers' point of view (Kissi, Dainty, & Liu, 2012; Shanker et al., 2017). Therefore, we posit that it is important to understand how managers perceive both organizational context and individual factors of collective efficacy within the innovation process.

## **METHOD**

### *Sample and procedure*

Our first procedural step was to conduct a pilot questionnaire with a sample of 30 adult students working in the public sector target population. This stage identified any potential problems with the questionnaire (Dillman et al., 2009). Data collected from this pilot test were reviewed, with minor modifications made to the translation. The second step made use of a web-based self-administered questionnaire (iPanel- the Israeli internet panel). In the first wave of data collection, a total of 550 complete responses were obtained from managers in the public sector (an 82.3% response rate). In the second wave 303 complete responses (a 55.09% response rate) were obtained. Pairing the respondents between the two waves provided complete data for 298 participants, corresponding to a total response rate of 54.18%.

## **RESULTS**

The findings indicate that innovative climate is positively related to collective implementation efficacy ( $\beta = 0.56, p < 0.001$ ;  $\beta = 0.54, p < 0.001$ ). Innovative climate is positively related to creative self-efficacy ( $\beta = 0.26, p < 0.001$ ;  $\beta = 0.36, p < 0.001$ ). The effect of innovative climate on collective implementation efficacy decreased in absolute size in wave 1 ( $\beta = 0.21, p < 0.01$ ) when controlling for the effect of creative self-efficacy, and fully mediates in wave 2 ( $\beta = 0.54, p < 0.01$ ); Sobel test statistic = 2.80,  $p < .001$ ;  $R^2 = 0.38$ . The effect of innovative climate on collective implementation efficacy decreased in absolute size in wave 1 and 2 respectively ( $\beta = 0.26, p < 0.001$ ;  $\beta = 0.34, p < 0.001$ ) when controlling for the effect of leader expectations; Sobel test statistic = 4.08,  $p < .001$ ;  $R^2 = 0.45$ . The effect of innovative climate on collective implementation efficacy decreased in absolute size in wave 1 and 2 respectively ( $\beta = 0.32, p < 0.001$ ;  $\beta = 0.29, p < 0.001$ ) when controlling for the effect of proactive behavior; Sobel test statistic = 4.87,  $p < .001$ ;  $R^2 = 0.42$ .

## **DISCUSSION AND CONCLUSIONS**

This study focuses on the organizational and individual factors shaping managers' collective implementation efficacy among public sector organizations implement service delivery innovation. Specifically, drawing on the scholarly argument that public managers play a central role in maximizing innovation (Borins, 2014; OECD, 2017b), this study seeks to understand how the influence of innovative climate on managers' collective implementation efficacy is mediated by creative self-efficacy, leader expectations for creativity and proactive behaviour. By investigating these factors among managers under the 'Digital Israel' program, our study provides relevant lessons for most OECD and EU governments presently face the challenge to obtain successful implementation of service delivery innovation across their public-sector organization. Further, the results of this study offer a number of contributions for theory, research, and practice.

Drawing on Social Cognitive Theory (Bandura, 1997, 2001, 2002), the study suggests an agentic perspective to understand the role of managers' self- and collective efficacy in actualizing and implementing innovation in the workplace. Social cognitive theory offers useful explanations for the psychological and behavioural elements leading to an understanding of the scene behind of innovation process and behaviour. Therefore, this study's findings are of interest because they reveal the psychological and contextual elements behind innovation implementation. In this respect, the research model delineating the effect of both contextual and individual antecedents on collective implementation efficacy yielded a number of helpful results.

First, the findings confirm that the significance of the relationship between innovative climate and creative self-efficacy as well as collective implementation efficacy. It asserts that the key constituent of managing for innovation is creating the appropriate climate so that employees can share and build upon each other's ideas and suggestions (Shanker et al., 2017).

Second, in light of the fact that the implementation of services delivery innovation among developed economies is a relatively new phenomenon, accelerated in recent decades, organizational leaders must be understood as playing a central role in promoting innovation. As a recent comparative review suggested, frontline staff and middle managers often have the best understanding of the need to innovate (OECD, 2017, p. 19). In this regard, leader expectations for creativity was found as partly mediated between innovative climate and collective implementation efficacy. Signals originating with senior management are likely to be a particularly effective step forward toward innovation implementation (Choi & Moon, 2013), as management's support was found to be a strengthening factor for collective implementation efficacy (Choi & Chang, 2009). The managers' perceptions may be consistent with Bandura's (2002) suggestion that perceived collective efficacy bring the dynamics of group functioning to fruition.

Third, our results corroborate previous studies' findings that high self-efficacy in employees is positively correlated with proactive behaviour (Griffin et al., 2010; Huang, 2017). However, the findings add to the already existing knowledge that proactive behaviour is partly mediated between creative self-efficacy and innovation implementation efficacy. In the context of innovation, people's self-efficacy beliefs determine their level of motivation, as reflected in how much effort they would exert in any endeavour (Bandura, 1989). Proactive behaviour can be aimed at objectives aligned with prosocial and organizational (Grant & Ashford, 2008; Griffin et al., 2007), and as such encourage collective implementation efficacy. Managers' behaviour related to innovation is particularly influential in shaping related collective efficacy (Chen & Bliese, 2002). In this regard, this study shows that when line managers possess creative self-efficacy as well as proactive temperaments, collective implementation efficacy may be advanced.

To conclude, our study is among the first efforts to examine how OCI, creative self-efficacy, leader expectations for creativity and proactive behaviour jointly facilitate collective implementation efficacy among line-managers within the public-sector organizations. Further, it offers new agentic perspectives for the examination of organizational and individual factors shaping collective implementation efficacy. Given that the innovation implementation forms a cyclical process, in which management tends to introduce another innovation immediately after adopting a previous one and that a high rate of implementation failure is endemic to innovative activity (Chung, et. al., 2017), this study contributes a specific consideration of factors reinforcing this important ongoing process.

## **IMPLICATIONS FOR POLICY MAKERS AND MANAGERIAL PRACTICE**

This study investigates public sector managers' perceptions while they implement service delivery. Equally important, the study was conducted within the Digital Government program where the digitization of public services is in full swing across all public organizations. Our findings have implications for both policy-making and managerial practice.

The distinct context of public sector innovation (where policy makers have a mandate to allocate service delivery innovation) permits the following suggestions. Policy makers should nurture organizational leaders who have influence in encouraging innovation as a means to improve service effectiveness which is of benefit to citizens and other stakeholders. Investment in tutoring and equipping them with skills needed to implement service delivery innovation is paramount. Once new digital services are adopted, it is policy-makers' responsibility to provide supportive, tailored programs across the public-sector organization, integrate training for managers, lead them to create supportive environment for public servants as they confronted with an adopted service-innovation.

At the internal organizational level, public managers, the targeted group for leading innovation, should act as 'innovation implementation-enhancing forces'. They should provide motivational infrastructure for their followers to work toward the organization's mission – beneficial service innovation. Second, considering the crucial value to organizational innovation of behaving proactively (Parker & Pu, 2014), managers with a proactive approach can stimulate their followers by continually encouraging the idea of implementation as a process. In particular, targeted proactive intention increases intellectual stimulation among employees, helping them to overcome difficulties during the implementation phase. Finally, managers who model a high level of collective implementation efficacy should energize subordinates to collaborate with colleagues to realize the intended benefits of new digital services for all stakeholders. The resulting high collective efficacy felt by subordinates is an important resource to maximize the implementation of new public services.

# COLOUR AND SLOT MACHINE GAMES: AN ANALYSIS OF SOUTH AFRICAN CASINO GAMER'S

Wannenburg, Elizma

Tshwane University of Technology, Pretoria, South Africa

## ABSTRACT

## INTRODUCTION

From the ancient Greeks and Romans to Napoleon's France and Elizabethan England history, people used various devices to bet on the outcome of random events. The first slot machines were originally used as automatic vending machines and in 1899 Charles Fey manufactured the first slot machine, called the Liberty bell (Bellis, 2019). The rapid growth of live online casinos, urged management of land based casinos to relook at their current product offerings (Econotimes,2020). The Parliamentary monitoring group, indicated in the (2011) gambling review commission report that land based casinos need to modernize their product offerings in order to stay sustainable. When navigating a casino gaming floor, one is overwhelmed by the different variations of colours. According to Joosten, Lankveld & Spronck (2010) psychological research has shown that music and color affect people's emotions and behavior, while gaming. The current body of knowledge on the role of colour in gaming can be classified into two broad streams namely the role of colour in the operational side of slot machine games (Bennette, 2000; Turner and Horbay, 2004) and the role of colour in gaming (Herbert, 1962; Fisher, and Griffiths, 1995; Wolfson and Case, 2000). Zlomke and Dixon (2006), as cited by Dixon, Bihler and Nastally (2011:2), conducted a study in which nine participants were asked to respond to two concurrently available slot machines, differing only in colour: one yellow and one blue. Eight out of the nine participants preferred the yellow slot machine rather than the blue one. Robles (2012:4) states that Kandinsky (1912) explained in his colour theory, that when people see the colour yellow, they see "cheeky and exciting", the colour blue creates a feeling of deep, inner peace. In light of the above, it can be concluded that there is a lack of current research on the influence of colour on slot machine gamers. To address the identified need, 630 slot machine gamers were interviewed at six selected Sun International casinos in South Africa. The purpose of this quantitative descriptive study is to determine the influence of colour on the perceptions and experiences of slot machine gamers. The 630 structured questionnaires were obtained through personal interviews in the gaming areas. By understanding the importance of colour in slot machine games, can assist slot machine game designers in the developed of new games that will satisfy the rising need for technology and interactive gaming at land based casinos.

## METHODOLOGY

Based on the preceding contextual background and the literature, this study aimed to meet the following research objective and related hypothesis. Objective: To determine whether colour as slot machine attribute influence the slot machine selection of casino gamers. From this research objective the following hypothesis were formulated:

**H<sub>01</sub>**- No significant differences exist between male and female slot machine gamers regarding the way they perceive colour as a slot machine attribute.

**H<sub>a1</sub>**- Significant differences exist between male and female gamers regarding the way they perceive colour as a slot machine attribute.

Cluster sampling method was used in the selection of the subgroups which were representative of the population (slot machine gamers, busy playing on a slot machine game). Fieldworkers conducted personal interviews with 630 gamers within the gaming areas of the six selected Sun International Casinos. The raw data obtained from the questionnaires was edited before it was statistically analysed with the SPSS statistical software program.

## RESULTS

Colour as slot machine attribute was statistically analysed by applying a Chi-square test. The results indicated that (34.3%) preferred blue followed by (21.6%) red and the least favorite colour was (12.1%) yellow, opposing the findings of Zlomke and Dixon (2006). Gamers were asked if they could design their own slot machine, what the outside colour of the machine would be. The majority (23.7%) indicated black followed by blue (21.1%). With regards to the levels of disagreement and agreement on how gamers perceive colour as a slot machine attribute: Both male (61.8%) and female (72.9%) gamers **agree** that when entering the gaming area of the casino, they noticed all the various colours around them. The male (57.1%) and female (62%) gamers also **agreed** with the statement that when they select a slot machine to play, they only focus on the slot machine game, and not on the outside colour of the slot machine. Both male (67.3%) and female (72.9%) respondents **agree** with the statement that coloured lights on top of the slot machines that indicate the different denominations are a good idea. Finally, when asked if "Colour plays a role in my slot machine selection" both male (54.4%) and female (55.7%) gamers **agreed** with this statement.

## CONCLUSION

Colours can trigger different emotions within us and therefore the ambience created within the casinos helps gamers to forget about their everyday lives and to focus on the gameplay. Casinos

controls the ambience through the implementation of various colours not only on the walls but also on the slot machine games. By understanding the importance of colour in slot machine games, can assist slot machine game designers with the development of new slot machine games that will generate the right emotions needed for continues gaming pleasure that in turn will contribute to the sustainability of the casino.

# THE IMPACT OF SOCIAL MEDIA CONTENT ON TOURISTS' TRIP PLANNING: THE ROLE OF TOURIST INSPIRATION

Wei Yao, Sonia Vilches-Montero; Ameet, Pandit

Newcastle Business School, University of Newcastle, Australia

## ABSTRACT

Although social media content as an effective marketing tool plays an essential role to trigger outbound tourists' interests and affecting their trip planning process, little is known about the underlying mechanisms among them. This paper proposes a three-stage conceptual diagram of how outbound tourists process and use social media content for the selection of different destination choices and local activities. The three stages include social media content, tourists' inspiration and trip planning. This paper provides a potential diagram dimension and suggests that the social media content could inspire tourists their outbound destination and activity choices. These insights produce new and useful insights for scholars and practitioners, such as designing effective social media marketing initiatives in destination promotion. This research finds the different tourist attitudes towards user-generated content (UGC) and firm-generated content (FGC) when they screen various categories of travel relevant content on social media platforms. Most tourists prefer to review UGC instead of FGC on some occasions during their trip planning process.

## 1. INTRODUCTION

The popularisation and use of social media has affected tourism marketers to stimulate communication, engagement and interaction, which are likely to generate increased loyalty and awareness and, positive word of mouth, and image (Leung et al., 2013). There is an emergence of the use of social media for travel products and services which in turn attracts tourists to search and share tourism-related information via these platforms and assists them in making their trip planning (Kim et al., 2017). Tourists can collect travel information from official destination accounts and other travellers across varied social media platforms (e.g. Instagram), as social media platforms provide an interactive communication channel. (Leung et al., 2013). However, few studies explore the underlying mechanisms during their trip planning process. To this end, we report the preliminary findings of a qualitative study to understand how user-generated content (UGC) and firm-generated content (FGC) influence tourist trip planning, including destination and activity.

## 2. LITERATURE

This study uses the tourist inspiration concept to understand how UGC and FGC influence tourist trip planning, including destination and activity choices. Tourist inspiration is derived from customer inspiration from marketing content. It includes two states: “inspired by” state and “inspired to” state. Customers receive new ideas or messages which can stimulate consumers’ imagination and mental horizons (Böttger et al., 2017). This experience can act as a transcendence process that leads to self-transformation (Böttger et al., 2017). By contrast, the inspired-to state links a consumption-related goal, which means that consumers pursue to actualize the new idea (Oleynick et al., 2014). As a destination marketer, it is important to increase engagement with tourists by inspiring them to share the tourism-related content (UGC) and be inspired by the content by destination marketers (FGC) on social media platforms. To this end, we explore how social-media content acts as an inspiration source during the trip planning stage, as socialmedia platforms can stimulate conversation and new ideas about trip planning (Hays et al., 2013). The conceptual diagram is presented in Figure 1.

## 3. METHODOLOGY & FINDINGS

We used semi-structured, in-depth interviews with 15 participants (age: 19-40; 6 Female and 9 male) to collect the primary data. Interview themes were grounded in the literature (Böttger et al., 2017). This study used NVivo 12 software to conduct a multi-stage data analysis. Stage one included reviewing the collected textual material (i.e. interview transcripts and documents) and using open-coding. Themes and narratives in the coding process were identified and labelled, followed theme development and axial coding (Keogh et al., 2020). The key themes and words emerge after this process. In terms of social media content, trustworthiness, e-word of mouth, a tour guide with fair comments are the keywords to influence their evaluation and trip planning selection, such as destination choice, travel activity and entertainment. Key opinion leaders (KOL) also have a powerful direction to trigger their inspiration and rise their interests to plan a future trip. The veritable image is more valuable compared with text and videos. Most tourists do not have the patience to watch a video if it takes more than 45 seconds. Unique and excite photos and vidoes with a good title can attract more tourists to review and feel the inspiration.

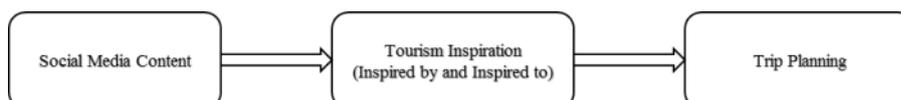

Figure 1: The conceptual diagram

#### 4. CONCLUSION

When tourists search for destination-related information on social media, other travellers' travel guides, advice and experiences can trigger their imagination and change their minds (Ye et al., 2011). In turn, the new ideas sourced from social-media content will be taken as a source of inspiration by travellers. The findings support that tourist inspiration could be a key mediator in the relationship between social media content and trip planning. Furthermore, the findings suggest that in the tourist mind, UGC is a dominant factor to influence their trip planning process compared with FGC. Images with brief intro texts and vlog (UGC) could attract tourists' attention to review and click the links. Tourists could feel inspiration from unique natural scenery, architecture and cultural experience. The next stage will include conducting a quantitative study to test the emergent model.

## **SOCIAL MEDIA CRISIS RESPONSES AND REPUTATION**

**Wut, Tai Ming; Ng, Mei-lan Peggy**

School of Professional Education and Executive Development, The Hong Kong Polytechnic University, HKSAR

### **ABSTRACT**

### **INTRODUCTION**

Social media crisis is defined as cases that might affect an organization and arise in or are amplified by social media (Coombs, 2015). Company responses are expected after social media crisis. Some companies are lack of immediate response for various reasons. One is the relevant posts come and go quite fast. Another one is based on a Chinese proverb "If you are do nothing wrong, it is no need to clarify." Even rumor might affect corporate reputation (Wut, 2019). The purpose of this study is how to make crisis response in order to regain corporate reputation.

### **LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT**

#### **Exemplification Theory**

Exemplification theory offers explanation how responses are spread and remembered over time (Ulmer et al., 2019). People in social media could do the same. Organization should not be passive or remain silent as other people are looking for their feedback. Even afterward such claim is proved wrong, an association between exemplar and the company can remain in the mind of stakeholders (Westerman, Spence & Lachlan, 2012). The image and the perception of the organization could cause impact on reputation. Thus, if an organizations offer an immediate response, it would certainly minimize the negative consequences.

Hypothesis 1: There is a significant difference in reputation rating in social media crisis between company with response and without response.

#### **Source Creditability Theory**

People are smart and some of them think that corporate response may speak for itself. Thus, key opinion leader's response could be more credible in the sense that they are not part of organization. Theoretically he or she should be neutral in their opinion although some people might think that they are sponsored.

Hypothesis 2: There is a significant difference in reputation rating in social media crisis between corporate response and key opinion leader (KOL) response

#### **Situational Crisis Communication Theory**

From Situational Crisis Communication Theory (SCCT), there is one common major crisis response strategy call Bolstering posture. This is a reinforcement posture and often used with some other response strategy. One way to present the posture is reminding. Reminding tells stakeholders about the past good works of organization (Coombs, 2015). Corporate social responsibility practice is one of the good works of organization.

Hypothesis 3: There is a significant difference in reputation rating in social media crisis between corporate response only and corporate response with follow up communication of reminding on social responsibility practice.

## **METHODOLOGY**

Scenario based survey study was used to investigate the effect of negative social media post. A group of 115 respondents were presented an introduction of a fictitious travel agency company and presented a social media post on Facebook describing a human resources problem of the travel agency company. The post was accompanied with clarification of the travel agency company or a key opinion leader. Reputation ratings were measured.

Two weeks later, respondents were presented some corporate social responsibility practices done by the company. Reputation ratings were measured again. Seven point Likert scales were used.

## **ANALYSIS**

Paired sample t-test was performed for hypothesis 1. The alternative hypothesis was supported for overall reputation quotient rating at p value = 0.01. Reputation rating of immediate corporate clarification is greater than without clarification (4.22 vs 3.27).

Paired samples t-test was performed for hypothesis 2. The null hypothesis cannot be rejected at p value = 0.264. Reputation rating with KOL endorsement is the same with corporate clarification.

Paired sample t-test was performed for hypothesis 3. The alternative hypothesis was supported for overall reputation quotient rating at p value = 0.01. Reputation rating of corporate response with follow up communication of reminding on social responsibility practice is greater than corporate response only (5.36 vs 4.22).

## **DISCUSSION AND CONCLUSION**

This study provides empirical evidences to support the Exemplification theory, source credibility theory and Situational Crisis Communication Theory. Immediate corporate clarification is recommended even for social media crises. Stakeholders are looking for information when something happens. Supporting statements from third party such as a key opinion leader is recommended to

increase the creditability of the clarification if the corporation is reluctant to give a response. The effect is the same. Follow up communication of remind past good work is a good strategy.

## **A 35 YEARS REVIEW OF CRISIS MANAGEMENT RESEARCH IN THE HOSPITALITY AND TOURISM INDUSTRY**

**Wut, Tai Ming; Xu, Bill; Wong, Helen Shun-mun**

School of Professional Education and Executive Development, The Hong Kong Polytechnic University, HKSAR

### **ABSTRACT**

### **INTRODUCTION**

The scope of crisis management includes crisis prevention, crisis preparation, crisis response and crisis revision (Hoise & Smith, 2004). Step to detect any warning signs is an important job in crisis prevention. Crisis preparation usually involves forming a crisis management team, crisis management team composition, formulate crisis preparation plans and training spokespersons. More people will recognize crisis response since the organization making response is usually under spot light. How do we learn from crisis is a central topic under crisis revision (Crandall et al., 2014).

This study aimed to examine and evaluate the literature of crisis management in the hospitality and tourism industry in a systematic manner. As the research areas are emerging, more papers are published during the past few years. The major themes and future research opportunities and agenda will be identified after a thematic content analysis of the related peer-reviewed journal articles. This study has the following questions:

- 1) What are the main themes of the crisis management literature in the hospitality and tourism industry?
- 2) What is the future research agenda regarding the hospitality and tourism industry and crisis management?

### **METHODOLOGY**

This systematic literature review adopted steps of Preferred Reporting items for systematic reviews and meta-analysis. 1) identify related articles through databases and other sources; 2) records after duplicates removed; 3) records screened; 4) full-text papers assessed for eligibility; and 5) studies included in qualitative synthesis. We searched for peer-reviewed journal articles published since 1980 in tourism and hospitality industry crisis management from electronic databases. We performed the searches during the period of 7-21 April 2020. Basic search was organized around the three constructs of 'tourism', 'hospitality', 'crisis', 'crisis management', 'risk', 'risk management', 'disaster', and 'disaster management'. In the total of 1078 search results generated from different combinations of the

mentioned keywords, 444 studies were included, with duplicated and irrelevant entries excluded. The selected articles are published in between 1985 and 2020. Figures in the year 2020 are not completed and given here for reference only. Authors assessed full text papers retrieved for inclusion in this review. After downloaded and imported the retrieved material, extracted data from the publications are recorded in an Excel document in alphabetical order of the first author's name, and key findings are identified from the abstract, discussion or conclusion.

## RESULTS AND CONCLUSION

The findings show that crisis/disaster management research has focused on refugee crisis, social media and political disturbances themes recently. Nine possible further research areas in the hospitality and tourism industry are proposed: data privacy, impacts on various tourism sectors for refugee crisis and political disturbance; social media crisis; less unexplored sectors, new analytic methods, health-related crisis, emerging crisis events, crisis prevention & crisis preparation and risk communication.

# FOOTBALL FAN LOYALTY: INFLUENCE OF MOTIVATION, INVOLVEMENT, FOLLOWING SPORT AND SATISFACTION

Yun, Jin Ho<sup>1</sup>; Sweeney, Kristi<sup>2</sup>; and Rosenberger III, Philip J.<sup>3</sup>

<sup>1</sup>Business School, Sungkyunkwan University, Seoul, South Korea

<sup>2</sup>Sport Management, University of North Florida, USA

<sup>3</sup>Central Coast Business School, University of Newcastle – Central Coast, Australia

## ABSTRACT

### 1. INTRODUCTION

Amongst the four Australian football codes—Australian Rules (AFL), Rugby League (NRL), Rugby Union (Super Rugby) and A-League football (soccer)—the A-League has struggled to increase its loyal fan base, experiencing declines in season attendance rates and TV viewership (Bossi, 2017). Although there have been extensive endeavours to reinvigorate the A-League's sports market, little research has examined the antecedents of A-League fan loyalty, especially capturing the effects of motivational, involvement and satisfaction types on attitudinal and behavioural aspects. Accordingly, we propose a theoretical framework, which posits fan motivation as a driver of enduring involvement and following sport, which then influence team and league satisfaction and then attitudinal (AL) and behavioural loyalty (BL). We briefly cover the literature, method and key findings.

### 2. LITERATURE

We used eight sports-fan motivations relevant for football: aesthetics, celebrity attraction, flow, performance evaluation, vicarious achievement, camaraderie (Wang et al., 2011; Rosenberger et al., 2019). Enduring involvement (EI) is the extent to which the consumer views the object or activity as a central part of their life (Higie and Feick, 1989). Following sport (FS) is ongoing-search activities not related to a purchase need but linked to their interest, engagement and perceptual vigilance for information on a team, league or sport (Stevens and Rosenberger, 2012). We focus on overall satisfaction with the team (TeamSAT) and league (LeagueSAT) (Beccarini & Ferrand, 2006) and consider both AL and BL (Wang et al., 2011); see Figure 1. Lastly, we also explore the mediating roles of FS and AL.

### 3. METHOD & RESULTS

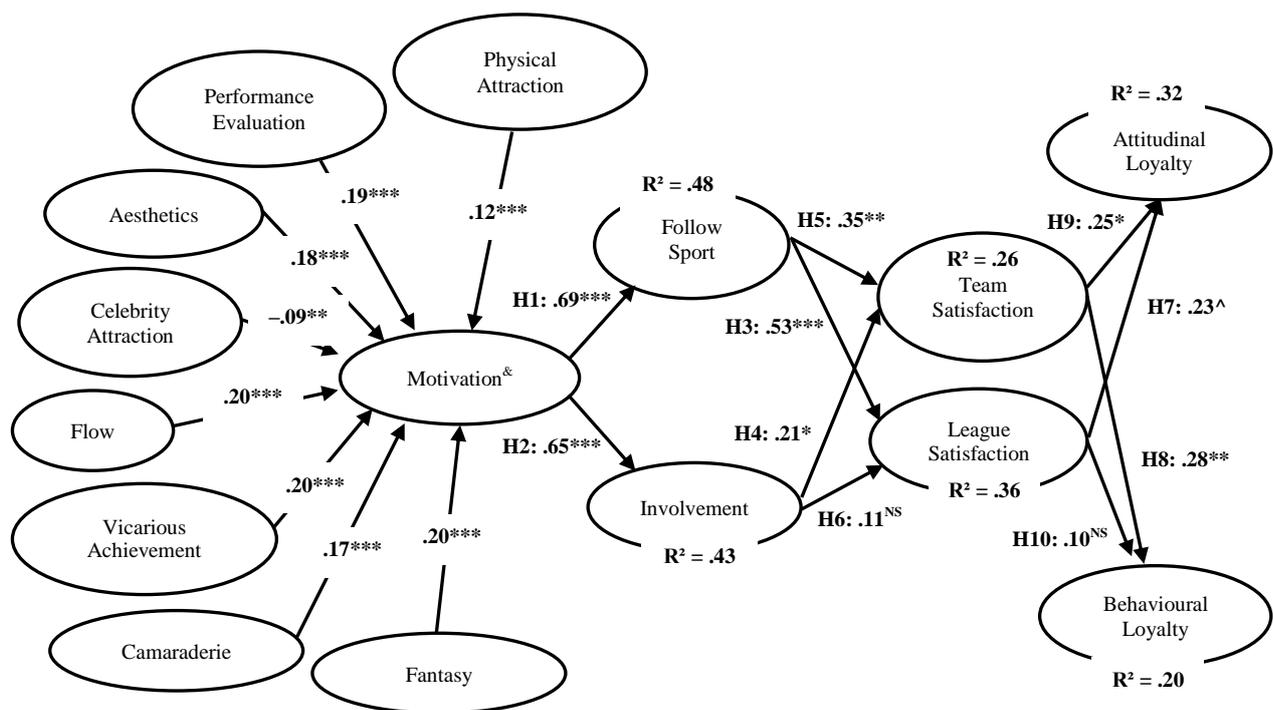

A convenience sample of 207 football fans came from an Australian university. Measures used: motivation (hierarchical, Type II construct), EI, FS, TeamSAT, LeagueSAT, AL and BL (Higie and

Feick, 1989; Stevens and Rosenberger, 2012; Wang et al., 2011). PLS-SEM analysis used SmartPLS v3.2.9 (Ringle et al., 2015). Cronbach's alpha ( $> .70$ ), composite reliability ( $> .85$ ), average variance extracted ( $AVE > .65$ ), inner model VIF values ( $< 3$ ),  $t$ -statistics and discriminant validity (Fornell-Larcker, HTMT) satisfied the recommended criteria. The results support most paths (see Figure 1). Further, the mediation results showed that following sport mediated the influence of involvement on TeamSAT ( $\beta = .085, p = .014$ ) and LeagueSAT ( $\beta = .130, p = .001$ ). AL mediated the influence of TeamSAT ( $\beta = .131, p = .032$ ) and LeagueSAT ( $\beta = .122, p = .053$ ) on BL.

#### 4. CONCLUSION

The preliminary results support the model's posited relationships. Limitations include use of a cross-sectional, Australian student sample. At the time of submission, further conceptual development, analysis and discussion work is in progress.

Figure 1. Conceptual Model Results

Notes: <sup>NS</sup> =  $p > .10$ , <sup>^</sup>  $p < .10$ , \* =  $p < .05$ , \*\* =  $p < .01$ , \*\*\* =  $p < .001$ ; & = reflective 1<sup>st</sup> order, formative 2<sup>nd</sup> order.
